Standing Timber

in Large or Small Blocks

**FOR
SALE**

THE undersigned offer for sale, in large or small blocks all their remaining timber lands and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, McConkey, Mills, Allen, Secord, Falconbridge and Street.

**Special
Prices**

Special bargains in the Townships of Falconbridge and Street for small mills.

BRITISH COLUMBIA RED CEDAR SHINGLES

MADE UNDER PATENT
RIGHTS TAKEN OUT BY
NATURE

THE secret process whereby Nature stores in the Red Cedar of British Columbia the qualities which make it the ideal roofing product of the world, are beyond the ken of man.

EVERY other form of roofing aims to imitate—in quality—in appearance—the results attained by using Red Cedar Shingles.

LIKE all other imitations of Nature, these fall short. No man-made product—the result of quick manufacture—can approach Nature's laboratory methods, whereby the moisture and sunlight of a generation is utilized in the storm-defying weather-proof texture, and the storage of decay-resisting oils, permeating the entire shingle.

Nature Roofing is superior, and the best type of Nature Roofing is found in British Columbia Red Cedar Shingles.

Owing to the exceptionally strong demand, dealers are advised to place their orders with the British Columbia mills at the earliest possible date.

We are prepared to furnish dealers with supplies of our B. C. Red Cedar Shingle. Booklets for distribution to your patrons. Write to-day, stating how many you can use.

Insuring Accurately Gummed Saws

S^AW gumming wheels should hold their shape to insure accurately ground teeth. Aloxite saw gumming wheels do.

For years a great deal of brains and painstaking effort have gone into the making of these wheels. They are made right. They are made to perform one special duty—that of gumming saws.

Aloxite Saw Gumming Wheels cut clean—they free themselves without drag, without undue friction. They cut fast and cool without case hardening the saw teeth or drawing the temper.

*Aloxite Wheels always insure
better saw service*

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Toronto, September 15, 1919

No. 18

What Intensive Effort Can Achieve

Are we living in too great haste? The word goes round to "speed up" in all directions. The result is frequently carelessness, loss and shortsightedness. Pick up any daily journal and in glancing over its pages one cannot fail to observe the number of fatal accidents that occur in mill, factory, warehouse, street and rural road. Most of these might have been avoided with proper heed and less rush. According to the report of the Workmen's Compensation Board, the number of accidents in lumbering during the past year increased. With improved safety devices, the wide interest aroused in Safety campaigns and the propaganda which has been carried on for years, fatalities and mishaps should be reduced.

That it is possible to keep down hazards to the minimum is evidenced by a rather interesting experiment which has been carried out through the Ontario Pulp and Paper Makers' Safety Association, of which A. P. Costigane, of Toronto, is Safety Engineer. This association is particularly aggressive and has by various means driven home the conviction that something special should be done to check the ever-increasing toll of injuries. It was recently decided to fix a period during which, with the co-operation of all employees, a concentrated effort would be made to create a record. The experiment was tried in the three plants of the Spanish River Pulp & Paper Mills, Limited, on a certain week, and although some 1800 men are employed in the pulp and paper mills of the organization at Sturgeon Falls, Espanola and Sault Ste. Marie, there was only one mishap during "No Accident Week." This was through the foolhardiness of a youth who was playing ball in the board mill at the Soo. He reached his hand into the winders to recover the ball, which had lodged there, with the result that he had his fingers badly crushed and lost ten days.

Previous to entering upon the "No Accident Week" signs were placed in every department urging the men to be particularly careful, while red colored triangles were given the employees to wear on

their overalls. Large cards were posted in prominent places with space left for the names of those who suffered accidents during the week, and, before the campaign, there was issued a statement to the effect that these cards would be printed with the names of any who were injured, when the period was over. There was also a large banner over the entrance gates with a reference to Safety Week and a request that the men help put it through without an accident.

In commenting upon the results of the experiment Mr. Costigane's report will be read with much interest by those engaged in the lumber and woodworking business. He states that one accident occurred, caused by pure carelessness, is most regrettable but much more to be deplored is the callous indifference of the injured youth toward the success of the campaign in which his fellow employees showed so much interest. The remarkable success of the experiment in the Spanish River Pulp & Paper Mills, he adds, shows what can be accomplished in preventing accidents when all pull together. The average accidents in these mills for the six months previous to the campaign works out at about seven per week, while during "No Accident Week" there was only one mishap, as already stated. If intensive efforts were made in all the mills of Canada the accident records would show a vast improvement, lost time would decrease in proportion, a large sum of money would be saved to employees and compensation payments would shrink within reasonable proportions. It is well worth the while for all mills to study this problem closely and emulate the example recently set at the big plants of this pulp and paper company by making a real attempt to reduce casualties.

Losing All Sense of Proportion

We are getting so that nothing staggers us. The terms millions and billions roll off the tongue of adults with the same ease and familiarity as one or two syllable words are pronounced in ordinary conversation. A few years ago when any organization was capitalized at \$100,000, it was thought to be an exceptionally large sum, but now a company capitalization of a million does not arouse more than passing interest. The war has so increased our conception of figures that we do not marvel at the magnitude of any statistics presented in connection with our industrial, financial or commercial life.

Exaggeration is resorted to in story, in act, in speech and in conduct, no doubt to create an impression. We do not take time to familiarize ourselves with numbers. When an output is worth so many thousands we speak of it in terms of hundreds of thousands; hundreds of thousands are converted into millions, and millions trail off into billions. While the war brought about many changes, it also engendered recklessness and disregard in other respects. This is seen every day in the press; for instance, one weekly journal announced a few weeks ago that a small local sawmill had started up and that the cut for the season would be 300,000,000 feet. In a representative paper published in a prosperous city in the Maritime Provinces appears a paragraph that one lumber firm is shipping a large portion of the order which had been recently placed with it by the British government. It is stated that this is part of the 40,000,000,000 ft. order lately placed by the Imperial authorities in Canada. The term 40,000,000,000 is not a staggering one perhaps when applied to the national debt of the United States, Great Britain or France, but when it comes to a matter of the lumber production in Canada the phrase is, at least, mystifying. The annual cut of all kinds of lumber in Canada, according to returns compiled by the Ottawa Bureau of Statistics—and these are as nearly accurate as it is possible to get them—is between 4,000,000,000 and 5,000,000,000 ft. As the cut every year since the outbreak of hostilities in Europe has shown a decrease of 10 to 15 per cent., owing to a scarcity of men, high cost of operation, diminishing demand in many lines, etc., it may be stated that, with a generous increase in 1920, the total output in the Dominion during the coming season will not be over 6,000,000,000 feet.

If Great Britain had placed an order for 40,000,000,000 ft. as represented in the press despatch, it would mean that the entire output of all the Canadian mills would be taken up for the next six or

seven years and not a board, plank or scantling be available for local builders. This would indeed be a distressing state of affairs, considering the active building campaign going on at the present juncture, and the other avenues for increased consumption of our wood goods such as the automobile industry, piano, phonograph, implement, carriage and furniture factories. The discrepancy in connection with the figure of 40,000,000,000 and the amount which has really been purchased in Canada—about 1,000,000,000 ft.—is not pointed out in any fault finding or critical spirit, but merely as revealing the trend of the age to magnify and exaggerate. It seems to take the colossal, gigantic or the stupendous in quantity, and, also in verbal terms, to arrest our attention in these days when there are so many distracting cares and rival interests.

Another shortcoming, too, is that in speaking of the timber holdings of lumber, pulp and paper companies. So many thousand acres are often referred to as so many thousand square miles. One enthusiast, when describing the immense timber berths of a Quebec concern lately made the positive assertion that they were so many hundreds of thousands of square miles, whereas the term should have been acres. An authority who had given some particular attention to areas, declared that according to the rash statement made, the property of the company in question would cover nearly the whole surface of Canada or the United States. It is well to put the best foot forward in all our relations in life, but there is neither wisdom nor foresight in exploiting our national assets, production, etc., to the point of being ridiculous or romantic.

Reforestation as Good Investment

Explaining recent increases in manufacturers' prices, a furniture maker says that not only are wages higher and work hours shorter than they were before the war, but the cost of material has been increased to an extraordinary extent. Quartered oak, which formerly cost \$78.00 per thousand feet, and which rose during the war to \$92, is now quoted at \$2.25. In England furniture manufacturers are said to be paying twice that price, which puts the cost of good oak lumber up to forty cents per square foot. The price of walnut is said to be advancing with equal rapidity.

There are many men still living who as boys took part in the destruction of the great hardwood forests of southwestern Ontario for the purpose of clearing the ground that crops might be planted. Had a tenth part of that forest wealth been spared the timber of Ontario's farms would to-day be one of the greatest sources of wealth in the province. The man who wants to leave something on the old homestead that will be of value to his children's children will make no mistake in setting out a plantation of hardwood trees. It may not yield any revenue in the lifetime of the present generation, but he who planteth a tree planteth hope.

Stiff Advance Made in Wharfage Rates

To the surprise of traders and shippers, the Montreal Harbor Commissioners gave notice of a stiff advance in wharfage rates. The lumber interests are naturally interested in the proposed new schedule, and the nature of the advance will be seen from the following comparison:—Timber and lumber, hewn or rough sawn, old rate 10c per 1,000 ft. b.m., or \$1.50 per carload when handled by rail and measurement unknown; new rate 15c per 1,000 ft., or \$2.50 per carload. Timber and lumber, planed or finished, old rate 10c per 1000 ft. or \$1.50 per carload; new rate 20c per 1,000 ft., or \$3.00 per carload. Under the new rate, timber and lumber has been classified into hewn or rough sawn and planed or finished, instead of being under one general classification, and it will be noted that the advances are very substantial. Railway ties, 8 feet lengths, have been boosted from 25c to 30c per 100 pieces, and 16 feet lengths from 50c to 60c. Shooks, shingles and staves go from 20c to 30c per ton, and wood pulp from 8c to 15c per ton.

Naturally there was a strong protest, not only against the increases, but against the suddenness with which the new tariff was issued. It was argued that the Harbor Commissioners, while perfectly within their rights as to issuing the schedule, should at least

have consulted the trades interested. It was further asserted that the charges would militate against Montreal in competition with other ports, where there are no wharfage charges. Mr. Stanley Cook, the secretary of the Montreal Lumber Association, took a leading part in the representations made to the Commissioners, with the result that the Commissioners have agreed to postpone the coming into effect of the new tariff until January 1, 1920. This will enable the trades interested to base their contracts for next season on the new rates.

The main reason advanced by the Commissioners for the proposed changes is that more revenue is necessary to meet the general rise in labor and materials. The Commissioners have only advanced wharfage charges once since 1914. Besides, the government has raised the rate of interest on loans to the Commissioners from 3½ per cent. to 5 per cent., and in this connection it is understood that the Board of Trade will probably ask the government to consider the question of reverting to the former rate of interest, in order that the new wharfage rates may not be fully enforced. The government made an inquiry into the proposed new rates before sanctioning the issue of the schedule by the Commissioners.

Annual Grievance Looms Up Early

There are some things that always appear to be with us. The tariff question, the high cost of living, shorter hours of labor, the servant problem, women's franchise, the extravagance of governments, the mediocrity of statesmen, profiteering, and last, but not least, the high cost of transportation and shortage in the supply of cars.

The Canadian Manufacturers' Association and the Railway War Board have been sending out notices to leading lumber companies and other large shippers to the effect that it is advisable to move all supplies possible at the present time in order to avoid delay and congestion later on and also to facilitate the movement of western grain to the seaboard.

But before the western harvest gets under way there is a cry raised in parliament about the scarcity of cars. This complaint comes from Frank Cahill, M.P. for Pontiac, Que., who declared that it was impossible to secure cars for the shipment of lumber and pulpwood from his county to the United States. Mr. Cahill stated that he had made inquiries at the department of railways and was informed that the cause of the shortage was that so many Canadian cars were already across the line. He thought some action should be taken to secure their return at the earliest possible moment.

A rather startling statement was made by a cabinet minister when he affirmed that it was no easy matter to get Canadian cars returned from Uncle Sam's domain, and that some of them remained in the Republic as long as a year. If such a state of affairs as this exists there is certainly ample scope for investigation. It is high time that the Minister of Railways and Canals, the railway commission or some other judicial body gets busy in the matter of remedying this undesirable condition. Surely there is laxity somewhere or Canadian cars would never be permitted to remain across the line for months at a stretch, particularly when they are so urgently required at home. We have numerous governing and administrative bodies in Canada to look after every interest, individual and corporate, but no particular branch of the public service seems to afford lumbermen and other shippers such incessant worry as the car situation. No sooner does it improve in one particular than there is a drawback or barrier in some other. If matters in the transportation line were running smoothly and satisfactorily for any protracted period some Canadian concerns would mistake such a state of affairs for the millenium.

— June exports of paper, pulp and pulpwood from Canada, totalled in value, \$7,345,851, as compared with \$9,120,262 in June last year. Paper shows a gain of \$153,538, and mechanically ground pulp of \$295,818, while chemically prepared pulp fell off \$1,105,652, and unmanufactured pulpwood \$1,118,114.

Exports for the first three months of the fiscal year show a decrease of \$2,478,375 compared with last year and a gain of \$4,702,547 compared with 1917.

Timber Wealth of Canada Seen at Great Fair

Keen Interest Aroused in the Magnificent Displays Made—Development of Lumber, Forestry, Pulp and Paper Activities Attractively Presented

The Canadian National Exhibition, Toronto, which has just closed its fortieth year, surpassed all records in the matter of attendance, exhibits and achievement. The big exposition has become national in character and representative of every art and enterprise in the Dominion. The attendance has reached nearly a million and a quarter and the educative, stimulating effect which the great annual spectacle and entertainment exerts upon the public mind cannot be measured in any community or financial sense.

The Canadian National as an institution has grown with each succeeding year and has kept step with every avenue of development and expansion that has characterized the onward march of the Dominion since the inauguration of Confederation.

There were a number of exhibits of special interest to lumbermen and among them were those of the Forest Branch of the Department of Lands of British Columbia, the Canadian Forestry Association and the Forest Products Laboratories, while woodworking firms also contributed to the interest and variety of the numerous splendid displays in all lines of industry, commerce, manufacture and invention.

One of the most spacious and attractive displays at the Canadian National Exhibition, Toronto, was that made by the Forestry Branch, Department of Lands of British Columbia. This was the first time in some years that an exhibit has been made of the wooded wealth of the Pacific Coast province and the results exceeded all previous undertakings. The space occupied in the Government Building was 12 x 65 feet. The walls were a natural finish of western pine, western spruce, western red cedar, Douglas fir, cottonwood, western hemlock and western larch.

The beauty and effectiveness of these woods were revealed in panels, pilasters, cornices, plate rails, and newels. There were also samples of various woods displayed to good advantage, showing them finished in cherry, walnut, light and dark mahogany, fumed oak, antique oak, golden oak and various other woods. These artistic panels naturally aroused much admiration presenting the many pleasing finishes to which British Columbia forest products are capable of being turned. There were also seen in the booth two sample

beauty;" "cottonwood makes superb finish;" "western larch is strong and durable;" "B. C. woods for cottage and mansion; supply unlimited for quantity and quality."

The entire display was open and accessible. There were no side issues and the attention of callers was focused upon the natural and handsome appearance of the wealth of forest products.

At one end of the large space there was another department devoted to fir doors, finished in old English, golden oak, cherry and natural. A double panel of B. C. dimension shingles of diamond, octagonal, circular and other shapes, as well as Perfection and XXXXX was observed.

Other displays in the wood goods line were tight and slack cooperage in fir and spruce; a wound wire water pipe made of Douglas

A section of the B. C. exhibit showing variety of uses of western woods. Note the beautiful grain in the fir posts

Some of the many products made from B. C. woods showing everything from a berry box to a door

stands adorned with various mouldings, flooring, ceiling, siding, and all exterior and interior trim, while on the walls were hung splendid photographs of typical British Columbia wood scenes illustrative of the giants of the forest and how they are converted to lumber.

Three centre tables added to the effectiveness of the exhibit. These were round and of an ornate pattern and finished in mahogany oak and walnut. Another convenience was a Douglas fir settee, finished in oak, and what was of great interest to the ladies, proved to be a large red cedar chest.

On the back grounds of each of the different wood panels were the following in dull gilt letters, which drove home a striking message to the one million, two hundred thousand visitors at the fair: "B. C. woods are unexcelled for boats and canoes;" "western pine for all finishes;" "B. C. spruce for aeroplane and finish;" "B. C. red cedar for durability and elegance;" "Douglas fir for strength and

fir; tin tipped spruce berry baskets; raspberry baskets of spruce enclosed in a spruce crate; fir heading; cottonwood egg cases; collapsible berry boxes—in fact, everything from the daintiest little box to the heaviest packing case, representing adequately the worth of Douglas fir, Sitka spruce and other species in the making of all boxes and cooperage.

At the front were four shields, bearing the Prince of Wales feathers, while there were also miniature flags and other attractive decorations making the space one of the most picturesque, instructive and unique in the building.

Several parts of an aeroplane were shown including an outer interplane strut of the Hoffer flying boat, forest patrol model, and a section of the front wing beam of the same boat, made out of B. C. spruce.

Much interest was evinced by the public in the cottonwood exhibit. This material is excellent for veneer and plywood and the egg cases and similar packages came out of it called forth numerous inquiries. Another motto bore the announcement that B. C. spruce was the very thing for pails, tubs and boxes being light, strong and tasteless.

A distinct departure was made this year from the exhibit of former occasions. Instead of timber in the rough being featured, the exhibit consisted of the finished product which, needless to say, created a most favorable impression and aroused admiration for the representative woods from the dense forests of Canada's Sunset Province, which is naturally proud of her forests of fir, cedar, hemlock and spruce. These were the woods used extensively during the war in the manufacture of aeroplanes for the British and Canadian flyers. During the European conflict 35,000,000 ft. of spruce were employed in aeroplane construction and 10,000,000 ft. of fir, while British Columbia placed at the disposal of the British Columbia government sufficient sawn lumber for the manufacture of 30,000 planes.

There were also displays of sulphite and sulphate pulp, as well

and newsprint paper affording some conception of the possibilities of British Columbia in this direction.

The exhibit was in charge of Major James Brechin, British Columbia Lumber Commissioner for Eastern Ontario, whose offices are in the Kent Building, Toronto, and Mr. Wm. Robertson, of Victoria, B. C., who is in charge of trade extension work in connection with British Columbia forest products. It is probable that the exhibit at the Canadian National will be allowed to remain in Toronto and form a prominent feature in connection with the Lumber Commissioner's office.

Forestry, Woods, Pulp and Paper

Representative of the sylvan assets of the Dominion and the many useful products, industries, and operations arising out of this great national heritage, was the combined exhibit made at the Canadian National Exhibition by the Canadian Forestry Association whose headquarters are at Ottawa and the Forest Product Laboratories, Limited, of Montreal. The display, which was a striking one, was housed in the Railway Building and carried out under the auspices of the Canadian National Railways.

The pulp and paper industry of Canada is now forcing its way to the front and rapidly making of the Dominion the greatest news-

print country on earth. At one end of the booth was shown an immense roll of newsprint and on it were printed the words "The six Toronto daily newspapers require 1,000 spruce and balsam trees for each day's run." Then there were rolls of paper and spruce logs of various sizes all indicating the rapid growth of the newsprint industry. On the small roll, dated 1914, were the following figures: "Total number tons newsprint produced in 1914, 232,570—value, \$11,386,845;" on the 1919 roll: "800,000 tons newsprint—value \$60,000,000." Nothing could be more expressive of the rapid expansion of this vast industry than the statistics covering a period of five years. The booth was adorned with several small spruce trees and one plant of interest was the Egyptian Papyrus on which the world once depended for its paper manufacture. Cards conveyed much timely information to passers-by and one of them stated that the export trade of Canadian newsprint paper last year was worth more money than all the other manufacturing exports in Canada in pre-war time. It is also stated that Canadian spruce is rapidly becoming the chief reliance for 40,000,000 newspapers issued daily in the United States and Canada.

The exhibit of Canadian Forestry Association and Wood Products Laboratories at Canadian National Exhibition

print country on earth. At one end of the booth was shown an immense roll of newsprint and on it were printed the words "The six Toronto daily newspapers require 1,000 spruce and balsam trees for each day's run." Then there were rolls of paper and spruce logs of various sizes all indicating the rapid growth of the newsprint industry. On the small roll, dated 1914, were the following figures: "Total number tons newsprint produced in 1914, 232,570—value, \$11,386,845;" on the 1919 roll: "800,000 tons newsprint—value \$60,000,000." Nothing could be more expressive of the rapid expansion of this vast industry than the statistics covering a period of five years. The booth was adorned with several small spruce trees and one plant of interest was the Egyptian Papyrus on which the world once depended for its paper manufacture. Cards conveyed much timely information to passers-by and one of them stated that the export trade of Canadian newsprint paper last year was worth more money than all the other manufacturing exports in Canada in pre-war time. It is also stated that Canadian spruce is rapidly becoming the chief reliance for 40,000,000 newspapers issued daily in the United States and Canada.

In three sections there were shown by the Forest Products Laboratory of Montreal the raw materials used in the conversion of wood to pulp by the sulphite, mechanical and sulphate processes together with an interesting description of each process. The descriptive nature of manufacture of pulp from the log to the finished bale aroused much interest. In the sulphite section there were the spruce log, barked log, chips, sulphur, limestone, cooking liquor, and the finished articles were washed pulp, screened pulp, pulp in sheets and in bales, bleached and unbleached. In the ground wood demonstration there were the logs, the barked log, the pulp as it came from the grinders, the screened pulp and the screenings, while in the sulphate division there was the barked log, chips, salt cake, fused salts, green and white liquor, lime and black ash, and black liquor, as well as the pulp bark in sheets and baled. There was also exhibited sec-

tions of various trees, spruce, balsam, fir, hemlock, jack pine and poplar revealing the relative amount of wood used for pulp in the various processes, spruce furnishing by far the largest. Several discs of trees bearing the motto "Can you guess the age of these logs?" were observed and the years ran from 39 to 140.

Next there were panels cut from the various trees of Canada, with the slogan "Learn to know the woods of Canada." White pine, cedar, tamarack, hemlock, poplar, basswood, chestnut, cypress, quarter-cut white oak, plain red oak, quarter-cut oak, plain white oak, maple, rock elm, walnut, birch, butternut, brown ash, Douglas fir, western pine, spruce, B. C. cedar, Sitka spruce, etc., were presented. The story was told of how British Columbia played such an important part in the manufacture of aeroplanes during the war. British Columbia shipped in 1916 and 1917 sufficient wood for 30,000 aeroplanes.

In the hardwood department were three blocks—beech, birch and maple, and one of the statements was that 1,000,000 tons of these hardwoods are taken from the Canadian forests annually to supply the wood carbonizing and wood distilling industries of the country.

The Canadian Forestry exhibit was under the direction of Robson Black, of Ottawa, secretary of the association, while the display made by the Forest Products Laboratory of Canada was supervised by Wm. B. Stokes, who is in charge of the exhibit work of this institution. Various pulp and paper mills lent their assistance toward making the display interesting and instructive. There were also several large photographs in evidence depicting the interior of pulp mills and setting forth pictorially the various departments of the industry.

Imposing Display in Woodwork

An attractive display of doors, columns, newels, and stairwork was made in the Process Building at the Canadian National Exhibition by Batts, Limited, of Toronto. Their space extended some 60 ft. and attracted much favorable attention.

On one side was a pergola with Grecian columns, while next was a large and imposing entrance with Corinthian columns and on the right was a wide verandah with Ionic columns, while for interior decoration a number of columns and pedestals were shown in oak, Georgia pine and chestnut. Many styles of doors were displayed. All exterior columns were of white pine and were exhibited in both fluted and plain effects. Doors were seen in solid and veneer of various patterns, the principal woods being Georgia pine, chestnut, B. C. fir and oak. Newel posts of various artistic types aroused interest, particularly those in chestnut and quarter-cut oak, while there was an inviting display of stairwork. Balustrades, shaped, octagonal, square and round formed the front of this representative exhibit. Batts, Limited, have been very busy for some time supplying the woodwork for military hospitals on Christie St., Toronto, Fredericton, N. B., and other large structures including Loew's theatres in London, Ottawa, and Brantford. The company are just now employing twenty-seven returned soldiers, nine of whom are taking vocational training and all the men are doing good work.

Artistic Effects in House Trim

The R. Laidlaw Lumber Co., of Toronto, had a striking presentation of various lines made by them in the way of doors, flooring, newels, verandah and interior columns, etc. Doors were shown in gum, mahogany, quarter-cut oak, plain oak, chestnut and birch, while oak, maple and birch flooring were much in evidence. The walls of the booth were adorned with beaver board and there was a fine array of newel posts and pedestals of every description, both fluted and plain. The entire frame work of a barn was shown in miniature, all being made out of 1 in. to 2 in. stock, while there was also a framework of a garage. The barn model aroused much interest among farmers as in the structure the outside walls carry the roof so that no large timbers are required. There were also observed several Tennessee aromatic red cedar chests. The front entrance of a pretentious dwelling house was displayed showing some attractive pillars. The exhibit was arranged by Mr. W. Warren, superintendent of the West End Yard of the Company, Toronto.

From Spruce Tree to Newsprint

The Spanish River Pulp & Paper Mills of Espanola and the Abitibi Power & Paper Co., of Iroquois Falls each made very creditable exhibits of newsprint and groundwood and sulphite pulp in the Government Building at the Canadian National Exhibition. Newsprint was displayed in large rolls, while pulp was shown both in sheets and bales. There were numerous photographs presented in connection with each display showing the various departments of the Espanola and Iroquois Falls plants, while by means of glass jars and other receptacles a representation of the conversion of spruce wood into the finished roll of paper was given. The exhibits were viewed with much interest by a large number of lumbermen, paper dealers, publishers and others.

Cooperage Business is Active in Canada

The Industry is an Ancient One and Method of Working the Stock is Interesting—Operation in Leading Canadian Plant Described.

The plant of the Sutherland, Innes Co., Limited, at Chatham, Ont.

The cooperage industry at present is enjoying an active market. Demand for tight and slack goods has sprung up on all sides and attention is being directed to the future development of this line owing to the large amount of export business being done in commodities requiring such containers.

It is true that the export of cooperage stock in the Dominion is at present not very large owing to high carriage rates to the seaboard and the excessive charges for ocean transportation. At one time about 10,000,000 slack barrel staves with heading to match were shipped annually to Great Britain, whereas to-day only a few cars are sent forward although the demand is heavy. It is expected that in time matters will adjust themselves and export will be resumed on a large scale.

There are in Canada large tracts of timber suitable for cooperage and where these are located within easy supply of water transportation they will be the source of keeping the industry going for many years to come.

It is interesting to study the history and development of the cooperage business. It is one of the oldest trades known and from time immemorial people have read about the barrel and the cask; in fact, the barrel is one of the oldest forms of containers as well as one of the most serviceable the world has ever known. In some Chinese manuscripts written as far back as 2000 B.C. there are to be found descriptions of the barrel. The cooperage industry is, therefore, one that has been with us almost since the commencement of things.

For many years the Sutherland, Innes Co., Limited, of Chatham, Ont., who have plants both in Canada and the United States, as well as offices in England, have occupied a premier position in turning out goods in the cooperage line. They manufacture slack cooperage stock for sugar, flour, apples and other dry materials, while tight barrel stock for wines, oils and other liquids is turned out at their plant across the border.

The raw material for the manufacture of slack cooperage stock is delivered to the mills in the form of logs or bolts. These are sections of trees, sawn the proper length and either in the round or, where of large diameter, split to convenient sizes for handling.

Logs Bolted to Proper Length

When the logs arrive at the mill, they are bolted to the proper length, either with a swing circular saw or draw saw, they are then split on the bolting saw, into quarter cut bolts, 4' to 6' wide. The bolts are then placed in steam boxes, and steamed at least twelve hours. This softens the wood and conditions it so that it will cut easily. After being taken out of the steam boxes the bolts are barked and go to the equalizing saws, which consists of two cross-cut circular saws, running on the same mandrel, so as to make all bolts exactly the same length. After being equalized the bolts are cut into staves, on a knife having a 20 in. circle and cutting 160 staves per minute, and are then piled in sheds for drying. When the staves are thoroughly seasoned, four to six weeks, according to the weather, they are jointed on foot jointers to the bilge desired by the cooper, the bilge being of a suitable curve for the diameter of the barrel to be made.

For hoops the logs are sawn into plank 1½ in. thick, the planks are then boiled for 8 to 12 hours, and cut into beveled strips 5/16" x 3/8" x 1 3/8". The cutting is done on a knife cutting 140 to 150 strips per minute. These strips are planed on the edges, pointed at one end and thinned at the other on an automatic pointer and lapper, after which they are bailed and coiled in coils of 10 hoops each, while hot. When dry they are ready to nail on the barrel.

The logs for heading are made into bolts by the same process as used for staves or bolts cut in the woods are used.

The Turning Out of Heading

The bolts are sawn, on a swing saw, into boards half an inch thick, then seasoned either in the open for a time, or piled direct in the kiln. All boards have to be thoroughly kiln-dried, before being manufactured into heading. When thoroughly dry the boards are planed on one side, the edges jointed, the boards matched to the width of heading required, and turned round on a heading turner. Modern turners will turn from 2,500 to 5,000 sets of heading per day, depending on the diameter, and will make the heading with beveled edge, ready for the croze in the barrel, or a plain edge, the same as used in cheese boxes. The heading is packed in bundles, pressed in a heavy press and wired, after which it is ready to ship to the consumer.

Tight barrel staves are either split out of the bolts, with a froe, being made on the quarter, and then dressed to circle or flat, on a buckler or sawn on a drum saw. A buckler consists of two knives, between which the staves are forced by steam power, while a drum saw is a cylindrical saw, shaped like a drum, which saws the staves on a circle.

The staves are then jointed, sometimes kiln-dried, and finished into barrels by the cooper or machine shop. Tight barrel heading is made the same as slack barrel heading, but doweled and flagged so as to be liquid proof. In this country steel hoops are used on tight barrels. In Europe, half round hickory, oak or chestnut hoops are used to a large extent.

Biggest Lumber Cut Ever in the East

New Brunswick will next winter have the greatest lumber cut in history, according to all present indications.

The Department of Lands and Mines is preparing for a hitherto unheard of sized cut of 250 million feet on the crown lands, and it is believed that the cut on privately owned lands will be equally as large.

Shipping is now being made available for lumber cargoes from New Brunswick to overseas points, and it is estimated that in one week more than twenty-five million feet of manufactured lumber has been shipped by New Brunswick firms across the Atlantic.

Recently when the general strike in the lumber industry on the Miramichi was called every mill with one exception had a steamer in the process of loading. The employees selected the psychological moment for their strike, but leading men in the lumber industry declare that the outlook for profitable operations were never better than to-day despite high prices for labor, supplies and everything that enters into production of manufactured lumber.

Returns have only just been completed for the last season's lumber operations on the crown lands of New Brunswick, and the figures have furnished some startling surprises. While the estimated cut of 200 million feet was said at the time to be extravagant, even the officials of the department have been surprised to find that complete returns show 210 million feet of lumber actually cut on the crown lands and stumpage charged upon it. Included in this gross amount are some five or six hundred thousand railway ties.

Meanwhile standing timber is being sold at unprecedented prices. One of the biggest deals of this kind closed for some time is just reported from Queen's county, and it is said that \$15 per thousand is the price paid for the standing timber. Another case which illustrates the demand for timber lands is the recent sale by a York county farmer of the wooded part of his farm for \$10,000.

When and Where is All This Going to End?

Retail Lumberman Acknowledges That He is Beaten When it Comes to Offering Definite Views on Higher Prices, Building Outlook and Market Tendency

"I went to my banker the other day," declared a Toronto retail lumberman, "to find out just how conditions stand. Some years ago when I started out in business I was told that when things were going awry, the future uncertain and no one seemed to be able to ferret out where we were at, that the proper person to consult was one's banker. Ostensibly he has a clear, unprejudiced vision and is able to weigh matters as calmly and carefully as any one. However, I am free to confess that my banker in the present instance did not shed much light upon the general situation. He acknowledged before I was through with my queries that he knew little or nothing more than I did and that all signs by which the times could be read in the past, had gone askew and, that one man's estimate or forecast was practically as good as another's.

"Not obtaining very much satisfaction from my financial friend I consulted another who is connected with a leading institution. He told me just as sure as to-morrow's sun was going to rise, that within a period of two years we would witness the most drastic times through which the country had ever passed. 'It is coming sure,' this pessimist declared. 'You cannot start an automobile down hill and expect that it will keep up its speed all the time; it is bound to strike the bottom sooner or later and when it does there is naturally a crash.' I walked away from this Jeremiah.

"I myself thought that I was somewhat of a seer and, on the day that the armistice was declared, I made the prediction that values in lumber would drop decidedly. I considered that the war had been responsible for the abnormal demand and so much material had been diverted into shipbuilding, shell boxes, ammunition waggons, transports, military camps, depots, etc., that with the necessity for these things removed and lumber reverting to its original and natural field, there would inevitably be a decline. You would think so to view the matter dispassionately. But, alas, something came along that we had not reckoned with and that was the house-building campaign. Returned men must have domiciles and, naturally, there is a shortage of dwellings in every centre, large and small. The demand started in with considerable rush. Dry stocks were low as the lumber operators had been decreasing their cut from year to year and knowing that the war would come to an end sooner or later they did not care to be caught with an unusual quantity on hand.

Uncertain As To The Direction

"Now, I do not know whether to be a pessimist or an optimist. The last two years I have been a pessimist and did not buy heavily. I wish that I had done so as I could have secured a number of snaps in January and February and, with advancing values, made a nice clean-up. Now I do not know what to do. We have been told that the expenses of getting out lumber are higher all the while; that wages are equal to last year and the outlay for camp maintenance is aviating. I noticed that one of the largest retail firms in the city of Toronto is advocating "now is the time to build a home" and intimating that it is utterly shortsighted to await until something drops. It is predicted that no omens are appearing of a change for the better and brick, paint, glass, lumber and everything that enters into the average dwelling continues to soar. One dealer points out that hemlock lumber was selling last spring at \$35 per thousand and that the figure is now \$50; white pine is selling at \$60 to \$65 and B. C. fir at \$65 to \$70. This may be timely advice and again it may not. I cannot say.

"I have always been inclined to look on the cheerful and promising side of each question but the present situation has me beaten at the start off. This one thing I do know, and that is there is an awful lot of cheap stuff being put into the class of houses that are going up at present, No. 3 hemlock, cedar culls and other materials that can not be covered up. Even the most uninitiated must see its flimsy character.

Building Boom Makes Good Times

"The disposition of many people is to adopt the motto of not "How good" but "How cheap." Comparatively few persons can really afford to build a house at present prices. Supposing they do go ahead and in six months from now it has been discovered that values have taken a decline and a dwelling may be put up \$500 or \$1,000 cheaper. What then? This is going to hit the real estate man or the speculative builder who is proceeding on the present basis. On the other hand, if values rise the fellow who builds now, is the one

who will congratulate himself next spring that he did not delay matters.

"It is a difficult situation, indeed, for the average builder as well as the average lumberman to gauge himself with any degree of satisfaction. I realize that unless there is a lot of building going on in any town business generally is flat. Building activities put much money in circulation, not only in the ranks of labor but in the matter of general supplies and trade and the impetus is felt throughout the whole community. Let there be no building undertaken and times are generally stringent. A community must either grow or fall behind. There is no such a thing as marking time and while the prospects for structural work next year look bright I cannot tell you where we are at the present juncture. If I knew I would only be too glad to pass along the information.

"I picked up a local paper the other day and this is what another retail lumberman says in regard to operating expenses. I think his figures are a little high so far as the cost of meals in the bush are concerned, otherwise he may be as correct in his estimate as I am. Here is the statement: 'We are away behind in the delivery of orders owing to the shortage of supplies. Mills are paying \$65 to \$70 per month to lumberjacks in the bush, while board for the men is costing 50 to 75c. a meal. Before the war bushmen could be secured for \$30 per month and board cost about 15c. a meal per man. Horse feed also shows the same cost advancement, while increased freight rates also enter into the present high cost. Lumber will get dearer all the while and the longer you delay the more you will have to pay in putting up that new bungalow or apartment house.'

General Activity in Lumber Industry

The Labor Gazette, Ottawa, gives in its current issue a general review of lumbering conditions in Canada during the past month which will be read with interest:

Westville reported that lumbering, though slightly quieter than in the previous month, continued to give considerable employment. Charlottetown reported that lumbermen were quiet. At St. John the saw and shingle mills were running steadily; Fredericton reported the lumber mills in full operation. Quebec reported that saw and shingle mills were working to capacity, and Sherbrooke reported that they were busy. Three Rivers reported that several hundred men were employed in the lumber mills and in the lumber department of the St. Maurice Paper Co. The sawmills at Ottawa and Hull was busy. Owen Sound reported that the saw and shingle mills were active. Calgary reported that there was still a demand for men in the lumber camps and sawmills. Fernie reported that employment in the lumbering industry was very seriously affected by disastrous fires which cleaned out considerable timber areas, including logging camps and sawmills, and it was feared that employment in this district would be affected for many seasons to come. Vancouver reported that the lumber camps of the district were fairly busy and that the saw and shingle mills were actively engaged. Victoria reported that the lumber and logging industry was active, large shipments of lumber and shingles being made to foreign ports. The Canadian Puget Sound lumber mill commenced operations after being closed for three years.

Exhibition Car Touring Northern Ontario

The railway exhibition car of the Canadian Forestry Association is making a decided hit all through Northern Ontario. As many as one thousand visitors a day have called to see the various displays which are attractively arranged. The car is exceptionally well fitted up for the purpose and contains a multitude of exhibits showing the manufacture of pulp and lumber. There is also a model forest nursery, model lookout towers, forest telephone equipment, a working wireless system, a maple sugar bush, as well as an exhibit of forest insects and their depredations. A motion picture lecture is given every evening in a local hall of each place visited and deals almost exclusively with the importance of the forest industries and the need of guarding their raw materials. Jas. Dickson, an experienced forester, is delivering the lectures in connection with the motion picture propaganda and is accompanying the railway exhibition car throughout Northern Ontario.

What Advertising Can Do For the Yardman

Retail Lumber Dealers Should Drive Home Facts Concerning Their Stock, Service and Facilities—How Business With Public May Be Increased and Quickened

Advertising is something which the retail lumberman has often thought of, but seldom puts into practice. He believes in a certain kind of publicity, realizes its value, has some conception of its potentialities and yet, for some reason or other, does not undertake it. He hesitates, perhaps, on account of no one to lead the way, at other times owing to doubt as to what mediums to employ, or the special means that he should avail himself of, sometimes due to the fact that business is too good and no artificial aid is necessary in order to cause the orders to come in satisfactory.

There are other yard men who now and then claim that advertising is not necessary in their particular case, because their's is a staple line. There is no use directing people's attention to articles as common as white pine, sash, doors, stairs, hardwood flooring, interior trim, newel posts, etc. They maintain that, like water, food, light and air, which are all around, there is no pressing necessity of drawing attention to them. And, of course, there is the man who, even against his own convictions, will exclaim that advertising don't pay, never did pay, and that the fellow, who makes use of printer's ink, has to increase the price of his merchandise to reimburse him for the outlay.

Again, there are a number who really cannot bear to part with the cash. They see in advertising an expenditure for something that is not immediately tangible. If the retail lumberman is being supplied with printed matter in the shape of envelopes, note heads, bill heads, booklets, leaflets, catalogues, folders, etc., he can see exactly what is being returned to him in concrete form for his outlay. In using newspaper space he does not get any evidence of bulk or quantity and circulation is, perhaps, to him unknown or uninteresting. He will be told by the publisher that so many copies of a daily or weekly paper are issued, but all that the advertiser sees is one or two. He cannot size up the quantity the same as when he goes out in his yard and makes an inventory of the number of thousand feet that he has in pile—either in his sheds or in the dry kiln. Thus it is difficult to gauge accurately what advertising will do for a man, not only in the immediate present but in the future.

Publicity as Wise Investment

There are a number of shortsighted individuals who want to see two dollars come in first for every one that goes out. They have no faith in the future and but little in themselves. They are not willing to look upon publicity as a wise investment that will yield, if properly directed and carefully supervised, adequate returns for any money spent in that direction. Of course, the retail lumberman cannot have bargain sales, great sacrifices, pre-inventory clean-ups, stock-taking and other kinds of sales, the same as the ordinary store-keeper, but he can direct attention to the facilities which his yard possesses, the representative stock he has in hand, and the service he renders. He can state that he will be glad to give any advice with respect to building, furnishing estimates, submitting plans, etc. In half a score of ways he can do something for his clients that will arouse appreciation and thus establish a bond of union and connection that no competitor can break through and that time will strengthen and deepen.

There is another class of yardmen who feel that as they have been in business twenty, thirty or forty years, and their father was in business before them, and perhaps their grandfather, that is sufficient. Because Hammond, Edminson, Sellins, Walston or Ardley has been in the lumber line for years—in fact, born and brought up in the game, as the saying goes—there is no earthly necessity, they maintain, for seeking to make more widely known the name. One would think, to hear some of these people, that business was done on a name and a name alone. This is doubtless true to a certain extent, but no matter how historical, honored or esteemed a name may be, it will not do everything. At the back of it there must be seasonable goods, efficient delivery, correct estimating, a desire to serve and appreciation of favors extended as well as an idea of having every customer furnish repeat orders and not entirely cease connection with the lumber yard in one isolated transaction.

Make Them Think of Your Yard

The whole object of advertising is to emphasize the fact that when farmer Jenkins, contractor Meadows, citizen McVicar or the widow Harding wants anything in the line of lumber for extensions, renovations or any new structure such persons will immediately go

to Weeks the lumberman. By his service, his attention to duty, his aggressiveness and judicious advertising he has impressed upon the community the thought that his name is indissolubly linked up with lumber. There is one form of advertising that even the printed page cannot surpass in benefits, and that is when a man is spoken of, not so much as Bill Kelly or Tom Carter, but as Kelly the lumberman, or Carter the lumberman.

The reputation of a retail man is, of course, like that of Rome, not built in a day, but if one's business name is carefully guarded it is an invaluable asset, the same as a man's honor, his character, his disposition, or his temperament. No one can adequately appraise the worth of these attributes. It is only in a crisis, in a period of stress and strain, promotion, sale or some other large transaction that the true value of such a man is known and recognized. In ordinary everyday affairs these qualities perhaps are not "cashed in" upon and too often are like good health, not appreciated until taken away or, in a measure, undermined. It is largely the same with advertising carried out in a thoughtful, earnest way and with

A home is always a good security

a sincere wish evidenced to live up to all promises made. Returns, while they may not be exactly keyed or tabulated, are such that, just like the business man with a good reputation, a name for fair dealing, and honest, open trading, they tally every time. No one can tell what these mean from a mere dollars and cents standpoint, because they cannot be given monetary measure, but, in the esteem of the community, the goodwill of men, the affection of the public and the high regard of neighbors, there is ample evidence that these qualities count for something, as fellows of loose morals, shady reputation, tricky habits, or shiftless methods must admit.

Emphasize the Home Building Idea

One good point for a retail lumberman to emphasize in all his publicity plans is that any man who builds a home, is a better and more substantial citizen than one who is a mere renter. A home-owning citizen has a real, personal stake in the community. He feels that he is part and parcel of the city or town in which he resides, and everything that makes for its uplift and welfare is shared by him to a certain extent. It has been aptly impressed that a man can borrow money on a home, which is splendid security, but he can not borrow heavily on oil stocks, mining shares, etc.

It has been declared that one can never tell when an emergency will arise that will make it necessary for an owner to get hold of some cash quickly. The query naturally comes up—where?—and, of course, this is a difficult question to answer unless one is able to offer some security. There is none better than a home for no man likes to see his residence slip out of his hands. Even if he does meet with a temporary reverse he will redouble his efforts to pay back whatever money he has borrowed and protect that which is vital to him and to the happiness and comfort of his family. A home is worth fighting for at any and all times for it stands for the best things on the earth today.

Mr. Petry Enters Upon New Duties

Geo. E. Petry, Toronto, Ont.

Geo. E. Petry, who has been associated for some time with R. G. Chesbro, of Toronto, in the sale of British Columbia forest products has been appointed Ontario representative for the Campbell-MacLaurin Lumber Co., Limited, of Montreal. Mr. Petry will have his headquarters in Toronto at 67 Winchester St. and will cover all parts of the Province. He is one of the best liked and aggressive of the younger salesmen in the lumber industry and has acquired an excellent insight in both the production and distribution end. Mr. Petry was born in Toronto where he received his educational and technical training. He spent some four years in the service of his father, W. F. Petry, who conducts a planing-mill and lumber yard at 25 St. Alban St. Later he was associated with other firms which served to broaden his experience and previous to going with Mr. Chesbro, he was identified with J. P. Johnson & Son, wholesale lumber dealers, Toronto. The Campbell, MacLaurin Co., who have mills at Drummondville and Ste. Joseph De Lepage, Quebec, specialize in spruce of all kinds, and also handle New Brunswick shingles, eastern hemlock and Ontario pine. Mr. Petry's many friends will wish him every success in his new sphere of operation.

Mr. Manbert Returns From Old Country

A. C. Manbert, of Toronto, lumber commissioner for Ontario, who has been spending several months in Great Britain, conducting propaganda work in the interest of white pine and other woods of the Province, sailed for Canada on the "Scotian," on September 3rd, and reached Toronto last week.

Mr. Manbert has done energetic and important work in the Old Land, and his letters, which have appeared from time to time in the "Canada Lumberman" have told of the favorable reception accorded him in all the leading cities by importers, timber merchants, and large consumers. There is an active requisition for white pine, but cargoes on commercial account cannot be shipped in quantities desired at the present time, owing to inadequate ocean tonnage and prevailing high rates of carriage. There is no doubt that Mr. Manbert's mission has served to place Ontario forest products in the forefront in Great Britain.

As soon as industrial, political and labor conditions in the Mother Country revert to normal direct results will, in all likelihood, follow the campaign carried on by Mr. Manbert, who is looking well after his extended trip abroad, and will resume his duties as president of the Canadian General Lumber Co. In a subsequent issue he will, at the request of the "Canada Lumberman," review the whole lumber and business situation abroad and present some interesting and timely observations.

Building Trades Demands Upset Many Plans

The prosperity of the lumber business is dependent upon the general commercial activity, good crops, exports, the building situation, etc. The last named is perhaps the most important single condition, as far as domestic business is concerned. The prolonged dullness in that section promised to give place to considerable activity, notwithstanding the rise in prices. Although there have been occasional strikes in the construction trades, there was nothing like an important disturbance of that branch of business.

Montreal, however, is now threatened with a serious upheaval, owing to the demands of the Building Trades Council for shorter hours and increased wages. Some men in all fourteen sections constituting the building trade, have gone on strike. The demands are in certain cases very high, ranging up to 50 per cent. increase. The contractors resist the claims of the men, mainly on the ground that it is impossible to complete the contracts without loss if the higher scales are conceded. These jobs have been based on old rates, and to add even 25 per cent. to the cost obviously involves a loss to the employers.

Apart from the effect upon the work in hand, the new scale will mean a serious check to the revival in building. Costs have already gone up to an extent which stopped construction for a time and it

was only recently that work on a fair scale was commenced. If the extreme demands of the men are to be conceded, proprietors will think many times before they embark in building, and the contractors who are engaged in the speculative building of houses will simply decline to go ahead, having regard to the fact that they will be risking capital in putting up houses at a cost which precludes their sale to possible buyers.

Pushed to their utmost, the claims of the men will stifle enterprise, and will involve loss of trade to the lumber dealer and to others interested in the construction industry. There is a keen demand for houses in Montreal, and the public have been urged to "Build Now," but such appeals will be in vain if men who are anxious to build are faced with a situation which will not allow of a profit upon investment.

Spruce Bud Worms Do Much Destruction

Half of the balsam fir in New Brunswick has been destroyed by the spruce bud worm this year, according to a report by Prof. S. A. Graham, of the University of Minnesota, and Prof. J. D. Tothill, of the Dominion Entomological Bureau, who have returned to Fredericton after taking a trip of 125 miles through the crown timber lands of the province in company with L. S. Webb, of the Forests S.V.C.

They entered the woods about two weeks ago at Red Bank, near Newcastle, and then went to the head waters of the little southwest Miramichi. They came south across the Renous, and out of the woods at Boietown. The trip was made on foot and practically all the balsam fir which has been very plentiful in that district, has been destroyed. In some areas the pest attacked the spruce; and on the Renous the damage to spruce has been quite serious.

The World Is So Small After All

Recently there came into the hands of W. Gerard Power, manager of the River Ouelle Pulp & Lumber Co., St. Pacomé, Que., a rather interesting communication. The envelope bore the mark of the South American Mercantile Co., Uruguay, 828 Montevideo and the inscription was River Ouelle Pulp & Lumber Co., Spruce, Inglaterra. The last word had been crossed out by the postal authorities and "Canada" substituted. That the letter reached its proper destination with apparently little loss of time, even though no post office address or province was furnished, is a tribute to the thoroughness and foresight of the mail carriers. The River Ouelle Pulp & Lumber Co. believe that the South American Mercantile Co. must have seen their advertisement in the Export edition of the "Canada Lumberman." From the meagre address the River Ouelle Co. consider it difficult to understand how the envelope should have reached them at all. This goes to show that the world is sometimes not as large as we really think it is.

No Difficulty in Selling Lumber

Writing to the "Canada Lumberman" the manager of an Eastern Ontario lumber concern says "Business for this year has been exceptionally good and there is not much difficulty in finding buyers for all our stock. Everything has been moving like hot cakes. It certainly does not look as if there would be any decrease in the figure for wood goods during the next year at any rate. Production costs are high and the expense of feeding men in the bush is ascending all the while. Wages also remain at the top notch. Until there is some evidence that the apex has been reached in matters of this kind, there certainly will not be any decrease in the price of lumber which has not advanced as much in proportion as some other lines of building material."

Waterfront Workers Form Organization

The Long Shoremen on the Miramichi River who recently went on strike are now organized into a local of the International Long Shoremen's Association. An agreement has been reached with the mill owners for all classes of work and this agreement will hold good for the remainder of the year. The new scale of wages is, for inside ship laborers, 65c an hour with a 9 hour day, all outside laborers to have an advance of 10c an hour. All mill men are to receive a 9 hour day with a 10 hour pay, as previously paid.

The agreement was reached at a public meeting which was representative of the workers on both sides of the river from Loggieville and Newcastle, as well as the operators. The agreement was unanimously adopted after some discussion. It was decided to organize under the name of the Miramichi Waterfront Workers.

Douglas fir was discovered by Archibald Menzies at Nootka Sound, Vancouver Island, in 1792, during the voyage of Captain Vancouver, who first explored the waters of the north Pacific coast.

How Some Mills Dispose of Waste Material

Means Adopted by Woodworking Plants to Convert Refuse to the Best Possible Use

—Practical Outlets that the Future May Develop in This Line

Although there are not many saw mills in Ontario which as yet have electric drives, still there are a few, and this motive power is highly spoken of by its users as most satisfactory and economical. One mill owner in a town on the Georgian Bay who has instituted an electric drive, states that his saw dust is shipped by carload, and also all the other mill refuse, for which he finds a ready market.

The disposal of mill refuse has always been a live question with certain saw mill and woodworking operators, particularly those located a long way removed from wood-consuming centres or populous points where waste could be disposed of to advantage. The burner, the "hog" and the Dutch oven use up practically all waste material in the average steam saw mill that is not converted into lath or faggots. The city resident on paying a visit to some of these plants and seeing the amount of material being consumed in the engines and burners naturally exclaims "My, what a waste. Why, hundreds of families would give a great deal to have this stuff and look what it would be worth in K— or T—, etc." All this speculation is indulged in quite freely, but no thought is given to the fact that excessive freight charges would bring the cost of this material up to such an amount that its purchase would be practically prohibitive in the city.

Cheap wood is, of course, one of the economical conveniences of a saw mill town just the same as cheaper coal is the boon of those living near the mines, but all people cannot reside contiguous to the sources of supply or production of raw materials.

All these observations, naturally, bring up the question of what the majority of saw mill and woodworking plants do with their waste and how can it be most profitably or economically disposed of. Mills and woodworking plants that are run by electric power have to give considerable thought to disposing of saw dust, edgings, slabs and shavings, especially if the plants do not generate their own power. Those who do, naturally, burn up the material. Those concerns who do not, find it exceptionally difficult at times to get rid of the refuse. It accumulates and becomes a veritable nuisance, as well as increases the fire hazard of the plant.

Local Market Must be Found

The production of alcohol from sawdust or shavings can be accomplished by either hydrolysis or destructive distillation. After examining these two processes one is forced to the conclusion that owing to the high initial cost of equipment and the large scale on which the operations would have to be conducted, to be carried on profitably, this method of converting waste material cannot be considered by the small woodworker or even a group of factories.

Another possible outlet for this material might be to convert it into charcoal. This could be carried out on a much smaller scale and at much less expense than the production of alcohol. We have never heard of this method being tried and do not know whether it could be carried on profitably, or where a market could be found for the charcoal produced.

In practically all towns a limited market exists for sawdust and shavings. It has been demonstrated that they can be disposed of much more readily if they are kept separate from each other. The shavings can be used for bedding in stables, for packing crockery and other breakable commodities, and to a certain extent by gardeners and farmers for mulching around vines and shrubbery.

Again many firms have found it profitable to bale the shavings and in this way they can be shipped to a considerable distance. This offers an enlarged market. A few enquiries and perhaps a little judicious advertising might find a buyer who would take all the shavings that your plant produces at a price that would more than pay for the labor involved.

The owner of a plant in Vancouver, B.C., sold all his shavings to a firm of fish curers and smokers. They paid at the rate of 5c per bag for this material and did the filling of the bags, and the hauling, themselves. This is offered merely as an example, many opportunities of a like nature undoubtedly exist.

Sawdust Put to Many Uses

Sawdust has been put to a wide variety of uses, some of them, unfortunately, of very limited application. Its successful utilization depends largely upon the local market that may be found, as it is not a material that can be economically shipped to any distance.

As a suggestion, some of the uses to which sawdust has been put are as follows: Fuel in furnaces and stoves; fuel in gas produc-

ers; briquettes; fire lighters; fur dressing; meat smoking, absorbent on floors, in cuspidors, etc.; fire extinguishers; cleaning and drying agent for metals, machinery, etc.; bedding in stables; composition flooring, artificial wood, etc.; ethyl alcohol; distillation and extraction; hardening and annealing of metals; packing of all kinds, bottles, canned goods, etc.; heat insulation in cars, ice houses, etc.; sound deadening in floors, etc.; shipment of meats, shipments of grapes and other fruit; manufacture of soaps, manufacture of fertilizers; packing of ice cements, mortars and plasters; burning clay products; manufacture of wood flour; purification of gas; composition paving blocks; floor-sweeping compounds; manufacturing of oxalic acid; manufacture of carborundum and calcium carbide; protection of fresh concrete from too rapid drying; manufacture of illuminating gas; manufacture of wood meal fodder; manufacture of oatmeal wall papers; manufacture of velvet wall papers; lettering on floral emblems; manufacture of dyes; railroad signal rockets; medicinal purposes; stuffing pin cushions and dolls; manufacture of fireworks; circus rings; dressing wounds; moth preventive; coloring black clay pipes; drying ink; water-proofing mixtures; currying animals; tanning extracts; filtering meidum.

A large number of woodworking plants are equipped with blower exhaust systems that take the shavings and sawdust from the machines and deposit them in fire-proof vaults, usually at a distance from the factory. By having a separate vault for sawdust and one for shavings and having them elevated above the ground a suitable wagon can be driven under these vaults and loaded through a chute with a minimum of labor.

An Ontario manufacturer, who uses electric power, when asked how he disposed of his waste material, replied: The shavings we bale and dispose of wherever we can. Sometimes we find it necessary to advertise them.

We have a customer for all our sawdust. This we keep separate from the shavings by individual fans on rip and resaw, and blow it into a large bin overhead, so that it can be drawn off in sacks to haul to the customer. We find that small fans, driven from the counter shaft of the saws, work very satisfactorily, and have well paid for their cost and installation, and consume very little power.

The cuttings we sell for kindling wood. This is the best way we know of for disposing of planing mill waste.

In many centres where there are a number of factories using electric power it might be a good idea for them to get together and find some method of disposing of their waste collectively and at a profit. Through co-operation a market might be found or a method devised that would convert all waste material into a profit instead of losing it as at present.

If anyone, who has any suggestions to offer along this line, will communicate with the publishers of this journal their co-operation will be appreciated.

THE WM. LAKING LUMBER COMPANY

TORONTO, ONT.

Convenient order form of Toronto wholesale lumber firm

The execution of this order, if accepted, is subject to embargoes, accidents, delays of carriers or other obstructive causes beyond our control.

How Logging Costs are Ascending

Word received from various lumber companies indicates that men are now being sent to the bush in large numbers and in most centres there is a larger available supply of help than last season. The prospects are that logging operations this fall and winter will be greater than any period since the outbreak of the war. Information comes to hand of the intention of not a few concerns to add to the number of their camps.

The Victoria Harbor Lumber Company, Victoria Harbor, Ont., will considerably increase their cut of logs during the coming season. The company have six camps in operation at the present time, which is double the number at this period last year.

The Pigeon River Lumber Co., Limited, of Port Arthur, report that in a general way the production of forest products in that district for the coming year will not be higher than a year ago, but they consider the cost will be considerably in excess of 1917-18. The company state they were in hopes that the labor market would be somewhat improved from conditions a year ago, although they expect wages to be as high, if not higher. The Pigeon River Lumber Company add that, in building their camps or making improvements to them, they consider the comfort of their men as far as possible and figure that it is a good investment to have lumberjacks well fed and well cared for. When woodsmen meet with such conditions they are more satisfied and do better work.

The Stone Lumber Company, Marksville, Ont., report that they are not yet sure how extensively they will undertake logging, as prices of supplies and labor are such that profitable business appears impossible. They remark that, from the present outlook, it will take \$10 more per M. to produce lumber than last year if an organization is to have an even interest on investment.

The Abbotsford Lumber, Mining & Development Co. of Abbotsford, B. C., assert that they cannot see much different conditions ahead unless it be that the eight hour day becomes general. The company expect to use, at least, as many men this year as last and if any change it will be an increase as they look to having as much business as in 1918 when the camp was barely able to keep the mill going. The company add: Camp supplies and provisions have gone up considerably, and in place of losing around \$1,000.00 in feeding thirty men (we have a lot of married men who stay close to the camp and eat at home) we expect to have a deficit of over \$1,500.00 this year. We are at present cutting over 120 M. per day, and while we have had a good many come and go, numerous old hands have stayed right with us, and taking everything into consideration, they have been very satisfactory. Our wages have increased 75c per M., and logs are costing to get out slightly over \$1.00 more than last year.

Use of Electricity for Logging

The elimination of the fire hazard in the woods of the Pacific Coast is each year becoming more and more of a factor to be considered. As the lumber industry increases in volume the fire hazard, due to spark-emitting engines, increases.

The utilization of the electric donkey engine in place of steam has been given attention for several years. Some progress has been made. There were a good many obstacles to overcome. First a motor suited to this particular service had to be developed. The Snoqualmie Falls Lumber Co., Snoqualmie Falls, Wash., is electrifying a logging operation. The company has installed 6,000 feet of transmission line and is successfully operating one of the electric units. Ultimately the entire camp will be electrified. The Snoqualmie Falls Lumber Co. generates its electric current at the mill from the refuse and returns the current to the woods.

One of the big Central Oregon pine lumber companies is considering the advisability of electrifying its logging railroads. There is no doubt that in the future electricity will play as large and important part in logging as it now does in the transformation of the log into lumber.

The subject of electricity in the logging camps is one of deep interest to the logging industry and will be discussed at the tenth

session of the Pacific Logging Congress which will be held at Portland, Oregon, October 8 to 11. The headquarters of the congress will be at the Multnomah Hotel.

The officers of the congress are: W. W. Peed, president, Hammond Lumber Co., Eureka, Cal.; T. J. Humbird, vice-president, Humbird Lumber Co., Sandpoint, Idaho; George M. Cornwall, secretary-treasurer, editor, the Timberman, Portland, Oregon.

The executive committee consists of: British Columbia, J. M. Dempsey, British Columbia Loggers' Association, Vancouver; California, Donald Macdonald, the Pacific Lumber Co., Scotia, Idaho; H. M. Strathern, Post Falls Lumber & Mfg. Co., Post Falls; Montana, W. E. Ballard, Somers Lumber Co., Somers; Oregon, A. H. Powers, Smith-Powers Logging Co., Marshfield; Washington, Geo. W. Johnson, Admiralty Logging Co., Seattle.

What Spruce Forests Mean To Canada

"Mobilizing the Forests" was the subject of an address by Mr. Robson Black, secretary of the Canadian Forestry Association, at a meeting of the Bond Men's club, Montreal, on Sept. 3rd. He pointed out that pulp and paper exports from Canada had outstripped the record of all other manufactures of pre-war years, and that forest conservation had become the first storey of Canadian industry and finance.

There never has been any doubt that the development of agricultural crops and timber crops in Canada offers the line of least competitive resistance and most formidable promise, continued Mr. Black. Between the two activities existed no point of possible rivalry. Two-thirds of the Dominion of Canada is unfit for agriculture and can produce a profit to the state and private investor only when retained under growing timber. At this point of agreement, however, is encountered what has always been the millstone of forestry practice. Agricultural crops are annual and can be left to the business initiative of the individual. Forest crops repeat only in sixty to one hundred years. Agricultural planting is profitable within a twelvemonth; timber planting, for the ordinary human investor, defies most of the current business customs, for the dividends are never annual and may in some instances be centennial. These inherent peculiarities of conservative forest management outlaw private individuals as the dominant party and make forestry the natural function of the state.

Mr. Black emphasized that present deterioration of the forests in Canada was due to the continuation of a scheme of woodland exploitation that sufficed in an ancient day, but could not dovetail with modern industrial requirements or conceptions of government. Despite occasional claims, the main forest areas of Canada, east of British Columbia, the speaker claimed, were not reproducing their values. Studies of reproduction in New Brunswick had shown that on areas from which 9,000 feet per acre had been taken during the past thirty years, only enough trees were now growing to produce less than a thousand feet in the thirty years to come. In Mr. Black's view, any reform in the woods methods used by limit holders in Eastern Canada must of necessity be a compromise between ideal forestry and existing conditions. The first step must be a thorough survey of timber contents, rate of reproduction, best methods of removing all fire menaces such as lumbering slash, effective methods of logging so as to encourage growth of the best species, and this work called for friendly co-operation between limit holders and the provincial governments. Its obvious aim would be, not to increase immediate log supplies, but to put the prop of permanence beneath the wood-using industries of the Dominion.

"The spruce forests of Quebec and Ontario represent the country's most powerful magnet to those United States newsprint manufacturers who, self-robbed of their wood supplies by fire and poor management, are being forced to move equipment, lock, stock and barrel, to the source of forest materials over the Canadian border. Newsprint paper must continue to feed the huge maw of the American printing press, from which forty million papers proceed every week day," concluded Mr. Black.

Personal Paragraphs of Interest

James Innes of the Sutherland-Innes Co., Chatham, Ont., is on a business trip to England.

Alex. B. Lamont, of the C. G. Anderson Lumber Co., Ltd., Toronto, who has been spending the past few weeks at Midland and other points, has returned home.

F. L. Reed, of Toronto, late Ontario representative for the Campbell, MacLaurin Lumber Company, Montreal, has joined the selling staff of James G. Cane & Co., Toronto.

Oscar Thompson, of Syracuse, New York representative of the Union Lumber Co., spent a few days in Toronto recently on business.

D. C. Johnston, sales manager of the Union Lumber Co., Toronto, has returned after spending several weeks' holidays in an enjoyable automobile trip through the Adirondack Mountains.

A. L. Dawe, secretary of the Canadian Pulp & Paper Association, Montreal, is sailing for Canada from England on September 17th.

Geo. E. Lindsay, president of the Lindsay Factories, Limited, Toronto, who have disposed of their business, has been appointed manager for the J. C. Scott Co., Limited, who conduct a planing mill and lumber yard at 106 River St., Toronto.

J. L. MacFarlane, secretary of the Canadian General Lumber Company, who has been spending the past few weeks at his summer home at Chemong near Peterboro, has resumed his duties and is much improved in health.

Geo. E. Petry, Toronto, Ontario representative of the Campbell-MacLaurin Lumber Company, Montreal, has returned from a business trip to Drummondville, Calumet, Ottawa, and other eastern points.

A. E. Masuret, Ontario representative of the "Service" Lumber Co., Vancouver, B.C., has removed his office from 30 King St. W., Toronto, to the Canada Permanent Trust Building, 18 Toronto St., where he has more commodious quarters.

L. C. Fisher, one of the Eastern representatives of the British Government Timber Buyer, Montreal, after a brief visit to the Pacific Coast, has returned to England. He was called home earlier than was expected. Mr. Denman is now in sole charge of the Montreal office.

Jasper Haines, familiarly known as "Jasper," of the McLennan Lumber Co., Montreal, is once more back on the job, after an absence due to illness. He underwent an operation in a Montreal hospital. Mr. Haines, who has been with the company for eight years, was formerly with the Bathurst Lumber Co.

A. J. Young, of the Young Lumber Co., North Bay and Toronto, has been appointed treasurer of the new provincial organization of Ontario Liberals. Z. Mageau, M.P.P. of Sturgeon Falls, who is a well known lumberman, has been elected an executive member of the Northern Ontario district.

A. N. Dudley, wholesale lumber dealer of Toronto, has returned from a visit to Duluth and other points. Mr. Dudley will spend several weeks on a hunting expedition and his many friends hope that by the time he has returned that he will have regained his customary good health. He has not been feeling up to the mark for some time past.

Douglas M. Read, who is a brother of Alex. P. and Alfred E. Read of Read Bros., Limited, wholesale lumbermen, Toronto, has entered the service of the firm. Mr. Read spent several years overseas, enlisting with the 198th Batt. and being later transferred to the 19th. He returned to Toronto in March last and has since been pursuing a business college course.

H. W. Larkin, son of C. A. Larkin, a former widely known lumberman, has entered the wholesale line and opened an office at 45 Canada Permanent Building, 18 Toronto St., Toronto, under the name of the Larkin Lumber Co. Mr. Larkin served for several years overseas and many friends are glad to see him back in the lumber industry once more.

Hon. Valentine Winkler, Minister of Agriculture and Immigration for Manitoba, has been seriously ill. Mr. Winkler was first elected to the legislature in 1892, and has been a member of that body practically ever since. For many years he was engaged in the lumber business. He was born in Neustadt, Ont., and his place of residence now is Morden, Man.

Major James Brechin of Toronto, B. C. lumber commissioner for the east, left a few days ago on an extended trip to the Coast. On his return he will be accompanied by Mrs. Brechin and family. During his absence his duties are being looked after by Wm. Robertson of Victoria, B.C., who is in charge of trade extension in connection with the forestry branch of the Department of Lands.

C. C. Bockus has been appointed sales manager of the Edgecumbe-Newham Company, Ltd., with headquarters at Vancouver. Mr. Bockus was for three years with the Vancouver Lumber Company, and lately was the Eastern Canadian representative of the Allan-Stoltze Lumber Company, with his offices in Montreal. He has taken charge of the sales of the newly-formed Edgecumbe-Newham Company.

J. S. Knapman, of the McDonald Lumber Co., Toronto, recently returned from an extended business trip through Timmins, Porcupine and other points in Northern Ontario. He reports that the quantities of ties and pulpwood cut this season will be much larger than for many years and already there are huge piles of wood and ties along the railway tracks awaiting shipment.

Colonel Thos. Gibson, D.S.O., C.M.G., Deputy Overseas Minister of Militia for Canada, has returned to Toronto from London, England, and resumed his former duties as secretary of the Spanish River Pulp & Paper Mills. Colonel Gibson enlisted some four years ago with the 168th Oxford County Battalion, and crossed over as second in command. He spent about a year in France, where he was gassed and later returned to London, where he has ably filled leading administrative offices in military circles.

Elijah Moore, one of the oldest and most respected residents of Thorold, Ont., passed away recently in his 76th year. He was engaged for a quarter of a century in the constructing business and was afterwards in charge of the millwright department of the Riordon pulp mill at Merriton and also represented this company during the erection of their plant at Hawkesbury. He was then invited to assume operating charge, but not caring to remove from his native town of Thorold, he returned there and was in charge of the millwright department of the Montrose Division of the Provincial Paper Mills Co. He is survived by four children.

Geo. H. Holt, of the Holt Timber Co., Chicago, spent a few days in Toronto recently and says that owing to the building trade strike there is a complete tie up of structural work in the Windy City. Carpenters are holding out for \$1.00 an hour whereas the bosses have offered 92½¢ and there the matter has rested for some weeks. The retail lumbermen have also refused to sell any material to any contractors or private parties until after the labor trouble is over. This has been done to bring matters to a head and to clear the atmosphere. With a complete tie-up of men and materials it is expected that a settlement may be effected in the near future.

John B. Reid, of Toronto, vice-president of the Ontario Retail Lumber Dealers' Association, and Horace Boulton, Toronto, secretary of the organization, were present at the annual convention of the National Retail Lumber Dealers' Association, which was held in Detroit, Mich., Sept. 11th-13th. There was a large and representative attendance and the gathering was marked by much enthusiasm and optimism. C. A. Bowen is the energetic secretary of the National Retail Lumber Dealers' Association and to him much credit is due for the splendid results of the great gathering.

John J. Miller, who for several years past has been inspector of the National Hardwood Lumber Association with headquarters in Toronto, has joined the staff of the C. G. Anderson Lumber Co., Toronto, and will manage the hardwood department. Mr. Miller entered upon his new duties at the first of the month. He has had a varied and thorough experience in hardwood lumber in all its activities and brings to bear upon his position expert knowledge and wide acquaintanceship of the trade. Mr. Miller succeeds H. A. Stewart, formerly of Buffalo, who recently left for Manila, Philippine Islands, where he will supervise the mahogany department of Black & Yates, of New York City.

L. D. Barclay, of Toronto, eastern representative of Canadian Western Lumber Co. of Fraser Mills, B. C., returned recently after spending several weeks on a visit to Edmonton where his parents reside and on a trip to the Coast. He reports that the lumber business is very active in B. C. and that the American demand for Coast products is strong. Export trade is going on satisfactorily and all the mills are busy, some of them working overtime. Prices remain firm and regarding what trend they will take no one cares to predict. Shingle production is at its highest point in spite of the aviating values. Mr. Barclay says there is a great scarcity of houses not only in Vancouver but in nearly all the cities of the west and building operations are being rushed. Vancouver is enjoying much prosperity and has a bright future while the feeling of all the lumbermen in the province is optimistic.

There has recently been concluded in Quebec a series of twenty-one meetings held under the auspices of the Canadian Forestry Association. The attendance of settlers was unusually excellent and the motion pictures shown were greatly enjoyed. A. H. Beaubien, who is employed by the Canadian Forestry Association, had charge of all the meetings.

Just Thirty Years Ago

Interesting items from the fyles of the September edition of the "Canada Lumberman" away back in 1889

It is reported that Messrs. J. B. and R. H. Klock have purchased Mr. James MacLaren's Bear Creek timber limit for \$200,000.

* * *

Logs are being towed out of Lake Superior to the Bay City, Mich., mills. One raft of large dimensions passed Sault Ste. Marie last week.

* * *

The Longford Lumber Co.'s shingle mill at Orillia has been shut down for the season. The woodenware factory, however, has enough orders booked to keep the concern running for three or four months.

* * *

The Nassau mill, at Peterborough, closed Sept. 5th for the season, the supply of logs having been cut and the quantity of lumber in the yard being large, over twelve million feet. The steam mill will continue to run as usual.

* * *

Numerous gangs of men are being sent to the woods from Ottawa, Quebec and other points. Lumbermen are making preparations for the commencement of woods operations, and a lively winter's work in the woods is anticipated.

* * *

Mr. H. G. Buck of Norwood, is busily engaged in superintending the rafting of 50,000 feet of square timber at Belleville. It will be taken to Quebec, and on the arrival of the fall fleet will be shipped to Great Britain. This is the fourth raft Mr. Buck has shipped this year, making in all over 200,000 feet of square timber.

* * *

The mills of the Ontario Lumber Co., at French River, are run by steam, using a band saw, also a circular and gang saw. They cut on an average 100,000 feet of lumber per day, employing 100 men. This company load from 55 to 60 vessels with lumber for different ports each season. They are now engaged in making improvements in their mills.

* * *

A sawdust explosion took place in the Ottawa river, on the Hull side of the river, which threw water up some 15 feet high. There was luckily no boat in the vicinity at the time. The sawdust shoal in the Ottawa river just at the foot of the Government hill, is now fully a foot above the surface of the water. Recently several sawdust explosions have occurred in that vicinity which were big enough to swamp a small boat.

* * *

The sale of timber limits and mills, at Oliver, Coate & Co.'s Mart, Toronto, was well attended on Sept. 5th. The attraction was the sale of the property of the R. C. Smith estate, Port Hope. Among those present were: Messrs. Conlen, St. Catharines; T. G. Hazlitt, Peterborough; Dalton Ulyot, Peterborough; J. B. Pearce, Norwood; Jno. D. Smith, Fenelon Falls; Alex. Campbell, Kinmount, and Wm. Boyd; Bobcaygeon.

* * *

Lumberers are rapidly sending men into the woods. Messrs. R. Hurdman & Co. of Ottawa, have three crews at work on their Magnificiippi limits. Mr. A. Barnet has a crew at Barnet Lake; Mr. A. Fraser another at Misty Lake, Messrs. Chevrier & Whistle have two shanties running in full blast making logs for Messrs. Perley & Pattee. Mr. Louis Cheirier has a gang making improvements on the Nipissing branch of the Petawawa for Messrs. Booth & Co.

* * *

Complaints are again being heard from the various lumber quarters in Toronto regarding the snail pace adopted by the Grand Trunk railway in transmitting lumber from the various points of manufacture to the northern railway yard in that city. Ever since the Grand Trunk assumed control of the old Northern road, there has been no end of bickering between the lumbermen and the rail-

way officials, and a solution of the difficulty seems to be as far off as ever.

* * *

Mr. Robert Wilson, of Mr. J. R. Booth's firm, has returned to Ottawa after an extended tour through British Columbia. Mr. Wilson's object was to invest in the lumbering industry in that country, but owing to certain facts which he perceived on his trip he thought it advisable not to. He says that the mills there are of sufficient capacity to supply the local markets at present, and until the export trade is more developed there, and decreased in the eastern part of Canada, he is of the opinion that it would not be a wise investment.

* * *

A remarkable impetus has been given to the lumber industry of British Columbia within the past few months, and the next few years will witness a far greater development of the lumbering industry of that province. The facilities which British Columbia offers for the development of an export trade are such as to arrest the attention of capitalists. The Fraser River and its tributaries, which run through the vast timber regions of the northeast, offer exceptional advantages for floating the products of the forest to the sea coast for shipment.

* * *

The following are ruling prices at present for lumber at Vancouver: common S. I. S. do; on board cars, \$13; 1 x 4 flooring, No. 1, \$19; No. 2, \$17; 1 x 6 flooring, No. 1, \$18; do., No. 2, \$16; ceiling, No. 1 S, 4 S, \$19; No. 2, do, \$17; common rough plank* for sidewalks, delivered, \$9, lath per M, \$2, rough cedar, \$10 to \$12 per M, double dressed cedar, \$35 per M; single dressed, do., \$30 per M; shingles \$2 per M; maple, \$20 per M; curly do., \$75; pickets, rough, \$19 per M; dressed do., \$20.

* * *

A deputation consisting of Messrs. Robert Innes, Thos. G. Hazlitt, A. P. Pousette, James M. Irwin, E. B. Edwards, of Peterboro, and R. C. Strickland, Lakefield, accompanied by Mr. Jas. Stevenosn, M.P., for Peterboro, visited Ottawa on the 18th, and waited on Hon. C. H. Tupper, minister of marine and fisheries, re the sawdust in the river question. The government have for some time been prosecuting offenders who have been using the river around Peterboro as a receptacle for their spare sawdust. The millmen cannot see why if a portion of the Ottawa river is exempted from this law their river should not be treated likewise. They asked Mr. Tupper to make some amicable arrangement.

* * *

The protection of our forests is a question of vast importance both to the national government and to the citizens, and a question which demands the consideration of the well-meaning citizen and the thinking men of the country. Our forests have been and still are, a great source of wealth, but the rapid rate at which they are being denuded by the woodman's axe, to say nothing of their destruction by immense fires, is sufficient to cause alarm. More care should be taken in the preservation of existing forests, and the sooner the people are educated to the importance and necessity of preserving them and the replanting of new ones the better. It is a matter of vital importance to the well-being of the nation.

* * *

A large and influential meeting of lumbermen and others who were interested, was recently held at Bridgewater, N.S., to consider the sawdust question. As is usually the case at such meetings, exemption from the operation of the law was claimed, and it was stated that practically little or no injury was done by throwing the sawdust into the streams. In this instance it was claimed that the river La Have should be exempted, upon the grounds of justice and reason, as it was shown by evidence, official and otherwise, that the navigation of the river is as good to-day as a quarter of a century ago, and that the idea that sawdust injured the fish was at best a

mere conjecture, concerning which there has never been the slightest proof to back it up.

* * *

The E. B. Eddy Company have decided not to send any more men into the woods or make any more logs. The Eddy limits found employment for about 500 men yearly. The mills will close down unless sold. They employ a day gang of about 250. Unless the mills and limits are purchased before the logs are cut, several hundred men will be thrown out of employment.

* * *

A meeting of lumbermen operating timber limits in the Province of Quebec was held Sept. 5th, to consider the new regulations of the Crown Lands Department with respect to the prevention of destruction of timber by fire, and the tax imposed on limit holders for the purpose of enforcing such regulations. Mr. J. R. Booth presided. Under the new law the Government appoints fire rangers to enforce the regulations, and half the expense of maintaining these officials is paid by the Government, and the other half raised by assessment at the rate of ten cents per mile upon the limits under license.

* * *

At a recent sale of the Fredericton Boom Company, spruce logs brought \$9.10 a thousand for merchantable, and two-thirds of that price for battens. White pine sold for \$7.60, cedar \$5, and hemlock \$4.10.

* * *

During the month forest fires have done an immense amount of damage in New Brunswick; for miles the forest burned on each side of the tract on the Main Central Railroad. On the New Brunswick Railroad thousands of dollars of damage was done. The country roads were impassable on account of the heat. The towns of Fred-

erickton and Moncton were surrounded by flames and the people had to fight hard to save their property.

* * *

There promises to be great activity in the woods in New Brunswick the coming winter, and the cut will be unusually heavy. Operators who have hitherto gone to Aroostook are seeking grounds on the Canadian side of the line in consequence of the trouble and expense arising out of the United States bonded system, and also on account of the extremely high rates charged by the Aroostook people for camp supplies.

* * *

Lumbering in Nova Scotia appears to have brightened up, and there is quite an active demand for milling property. J. E. Dickey Stewiacke, recently placed his saw mill and timber limits in Eastville on the market. They were at once taken up by a company from Amherst that intends to cut lumber on a large scale. This property is considered one of the finest water privileges in Nova Scotia.

* * *

The shingle mill, of Gilmour & Co., Trenton, Ont., was burned September 4th. Loss about \$20,000; insured for \$13,000. The mill had been partly shut down for some time.

* * *

Mr. L. H. Hillman's mill situated on the Ottawa, opposite Kettle Island, was burned Sept. 11th, and 1,500,000 feet of lumber. Loss nearly \$200,000. The mill was valued at \$22,000; insured for \$8,000. The lumber was owned by the Rathbun Co., of Deseronto, and was principally this season's cut. It consisted of pine, ash, birch and basswood. It was valued at \$175,000, and was partly insured. Fifty men are thrown out of employment.

Are You Really Making Profit in Business?

You May Think You Are — But You Had Better Keep an Eye on Those Insidious Leaks Whose Effect is Out of Proportion to Their Apparent Importance

By F. C. Belser

Although accounting has in the past been generally considered as an unproductive expense, and has therefore not been given the attention which it deserves, there has been in recent years a very general realization that, without accurate knowledge of the cost of production and the expenses of doing business, the manager of a business concern is as helpless as the pilot of an ocean liner without a compass. The progress of cost accounting is, therefore, now making rapid strides.

It is the aim of every merchant and manufacturer to dispose of his goods at a price which will return to him, first, the cost of the article, including his expense of doing business, and, secondly such a profit over and above the cost as will return to him a fair rate of return on the capital invested. Therefore, in fixing prices he starts, as a rule, with what he considers cost. The difficulty arises when his information regarding cost is inaccurate or misleading. In his effort to develop his business he undersells his competitors, and when these prices are met he shades them again, not knowing exactly when the point of danger is reached or passed.

Weaker Operators Drop Out

So, as competition increases and prices are reduced, the weaker operators perforce drop out. The demand presently exceeds the supply, the prices rise, thus rewarding with generous profits those who survive. This new condition attracts new enterprises. The supply increases and prices fall again. The result is that in many industries extraordinarily prosperous periods alternate with exceptionally lean periods. These alternate periods of prosperity and depression are due partly, no doubt, to causes beyond the control of the particular industry, but it must be admitted that they are caused largely by faults and mistakes within the industry itself.

It is a remarkable fact that only relatively few enterprises become financially successful, and still fewer remain prosperous over long periods. Only occasionally is a business house encountered which has a history extending back over a generation, although there is no inherent reason why a business house, once established, should not go on indefinitely.

The profit factor is usually so small as compared with the cost of an article that any error in the costs, although the error may appear trifling in amount, must affect the profit factor by a very considerable percentage. For instance, suppose an article to cost \$1.00 and to sell at a net profit at 5c; an error of 1c in the costs, or only 1 per cent. of the whole, would encroach upon the profit to the ex-

tent of 1c out of 5c, or 20 per cent. thereof. Thus it is seen that an error in the cost of an article has an effect on the net profit out of all proportion to its apparent importance.

A business may show a profit as a whole and yet it may not necessarily follow that profits have been earned on each item of merchandise, for losses on one class of goods may be more than offset by profits on other classes. The result of such a condition can only mean, in the long run, the loss of the profitable business to competitors, and the retention of the unprofitable business which no one else wants.

Price Cutting and the Public

No merchant knowingly sells an article below its actual cost, unless, perhaps, under very exceptional circumstances. It follows, therefore, that cutting of prices, resulting in keen competition, is generally the direct result of erroneous cost figures. If by cutting prices the merchant hurt only himself, there could perhaps be no valid complaint, as he would very likely soon eliminate himself. But the effects of unsound competition must be considered in their relation not only to the individual, but as well to the industry as a whole, and to the consuming public.

By unsound business practices the individual ruins himself, brings down with him many of his competitors who must meet his competition, involving them all in loss for a time, and subjects the consuming public to erratic and violently fluctuating markets. If every member of an industry were fully informed as to his costs, the danger of underselling and price-cutting would be almost eliminated.

In recent years it has come to be recognized, therefore, that one of the most important activities of trade associations is to promote interest in accurate system of accounting and to aid every member of the association with the installation of such systems.

Fixing of Prices Prohibited

Thus, what is specifically prohibited by the Sherman Law, viz., the fixing of prices by agreement, is practically accomplished without effort and without direct design merely by making certain that every member of an industry knows his true costs, and then relying upon every individual to follow self-interest and fix prices based on sound economic principles.

Clear competition ought to centre around quality and service rather than price. It needs no salesman to secure orders at cut prices; anyone can do it. The variation in the market prices of articles of

the same kind will tend to become of decreasing importance with the spread of more accurate cost accounts.

When a materially lower price does appear it will be the direct consequence of more efficient operation and it would be only fair that the efficient operator should reap the benefit of his enterprise. But efficient operation and the elimination of waste are themselves among the most important objects to be achieved with the aid of accurate accounts.

In speaking of the advantages of accurate knowledge of costs one is often met with the argument that the selling price is after all based upon the market made by other sellers, and that no individual merchant can exercise any control over the price. This argument is, of course, childish, for in the long run the cost of production plus a profit, must be recovered in any industry, and the sooner the real cost is known, the sooner will the price find its economic level. Moreover, the man who knows it first will be the one to profit by knowledge.

The surest way to prevent any article being held for sale at an economically unsound price is to have reliable data regarding its cost most widely disseminated.

Although business men may be in sharp competition with each other, they have in fact a very well defined community of interest. The unsound and uneconomic practices of an operator affect directly or indirectly every other operator in the same line. An enlightened self-interest, therefore, demands every effort on the part of all to prevent each individual from creating disturbed business conditions. No other one thing will so help to stabilize trading as full knowledge on the part of all as to the real cost of production and of distribution, and to secure this knowledge is a matter of comparative simplicity, if the problem is approached in the proper manner, and when the objects to be achieved are kept clearly in view.

Laurentide Enjoys Year of Prosperity

The Laurentide Co., whose mills are at Grand Mere, Que., had the best year on record for the twelve months ending June 30th last. The net revenue was \$2,955,978 against \$2,593,834. Of the former amount \$232,651 came from lumber, a gain of \$84,530. The amount available for dividends was \$1,823,656 against \$1,704,655. The directors made unusually large deductions for depreciation, these including \$329,481 for palnt, and \$175,554 for the depletion of the timber limits. The sum of \$150,000 is set apart for the pension fund. The surplus stands at \$431,657, making a total surplus of \$2,857,204.

In the balance sheet, timber lands are valued at \$1,947,564, against \$2,090,165 (less reserve for depletion—a total of \$541,865 in 1919, and \$366,311 in the previous year), and logs and supplies \$2,533,912 as against \$1,855,250, the total assets being \$15,617,167, as compared with \$14,805,905.

At the annual meeting George Chahoon, Jr., the president, referred to the question of reforestation, in which the company is a pioneer. He stated that approximately 1,000,000 young trees had been planted during the year, and that it was hoped that the nursery by the spring of next year, would be capable of producing sufficient to bring the annual planting up to 2,000,000 trees. The loss through fire during the past year had been practically nil, Mr. Chahoon paying tribute to the very wise and far-seeing policy of the province of Quebec regarding forest protection. The outlook for the current year was exceedingly bright. The consumption of newsprint paper, based largely as it is on the demand for advertising space, exceeded anything in the world's history.

Officers and directors were re-elected as follows: George Chahoon, Jr., president; Chas. R. Hosmer, vice-president; R. B. Angus, Edwin Hanson, F. A. Sabbaton, J. K. L. Ross, and Sir Thomas Skinner, Bart., Louis Armstrong was named treasurer; W. F. Robinson, secretary, and F. E. McNally, assistant secretary.

What Retail Lumberman is Up Against

"Honestly, I would hate to send a friend of mine a lumber bill for any small repair job or alterations," remarked a leading Hamilton, Ont., yard man the other day. "Not that I am ashamed of the prices that I am charging but any man not thoroughly familiar with the condition of the market, the scarcity of stock and trend of prices, would naturally conclude that I was holding him up or 'sticking it into him' as the term is used. The fact is that quotations are now from 75 per cent. to 100 per cent. higher than they were before the war and unless a man has been undertaking some building or alterations no wand then requiring purchases from the yard he would naturally, come to the conclusion that, at the present levels, I was robbing him whereas I would only be getting a legitimate profit.

"It is utterly impossible now to build a few steps, lay a verandah floor, extend a platform, erect a sleeping porch or a new hen house, or do any small job without the cost appearing unreasonably high. I know of a customer who complained the other day about a bill that involved the making of only two flights of six steps, one flight four

feet wide and the other two, and the cost was nearly \$35. The carpenter's time alone—17 hours—was charged up at \$15, and the material was put in at all the way from \$75 to \$90 per M. This citizen thought that the expenditure would only be about \$15 or \$20 at the most and when it ran to practically double this sum he naturally raised strenuous objections. On inquiry, however, he found that he had not been overcharged as the job was a small one and since he had some work done a couple of years ago a new price basis had been ushered in.

"It is really amusing to see the face that some customers will draw when they come in here and ask for a couple of white pine boards which at one time they could get for 75c or 90c and when they are told that the cost today is \$2 to \$3 they naturally think that we are profiteers or in the graft game. I assure you that we are not and that the retail lumberman, considering his heavy investment and service, is making less money to-day than at any previous period in his history. We do not like to charge the prices now prevailing but it is absolutely necessary to do so and there is seemingly little or no hope so far as I can see of values falling within the next twelve months at any rate."

Gillies Bros. Sell Lumber Depot

The purchase of the Gillies Lumber Mill property in Morristown, directly opposite Brockville, Ont., by interests said to be representing William Randolph Hearst, New York publisher, who, it is said, will erect a mammoth paper mill in the neighboring village, has given rise to much speculation. The site was formerly owned by Gillies Brothers, lumber manufacturers of Braeside, near Arnprior, who used the plant for their American depot.

The property has been sold by Gillies Brothers directly to a dummy party. They do not say who the purchaser is, but do state that in all probability a paper plant, employing many persons, will be erected on the site.

For a number of years Gillies Bros. conducted a successful lumber and building business at Morristown, but closed down when lumber went skyrocketing in prices.

Newsprint Companies Are Making Money

The pulp and paper companies have been making large earnings during the past three or four years owing to the abnormal demand for newsprint. In fact, the requisitions for this commodity are increasing all the while and tonnage coming on the market does not meet the increasing quantities called for. Several companies are adding new equipment and this will greatly augment production. Price Bros. & Co. of Quebec City, are installing a new unit at Kenogami; the Spanish River Pulp & Paper Mills are adding two machines at Espanola and the Abitibi Power & Paper Co. are preparing to place in position four additional machines at Iroquois Falls. Forty-seven freight cars arrived recently laden with parts of the new equipment in the shape of huge dryer rolls. An addition is being erected to the mill to accommodate the new machines.

In regard to the earnings of the companies it is interesting to note that the Laurentide Co., of Grand Mere, Que., has shown, with one or two exceptions, a steady gain during the past fourteen years and the following table will prove of interest:

Year	Net before divids.	P.C. earned
1919	\$1,823,656	19.00
1918	1,704,655	17.75
1917	1,720,011	17.92
1916	917,822	10.92
1915	787,191	10.93
1914	730,774	10.14
1913	758,085	10.53
1912	753,572	10.45
1911	713,539	19.80
1910	216,305	23.20
1909	283,893	12.49
1908	251,459	9.02
1907	283,321	12.45
1906	271,846	11.74

The slight decrease in both net earnings and percentage earned in 1918, when compared to the previous year, are more nominal than real and due entirely to a change in bookkeeping practice.

Death of Mr. Joseph Chew

The death of Joseph Chew, 1195 Tenth Ave. W., Vancouver, took place recently following an operation. Deceased, who was 67 years of age, owned a shingle mill on False Creek and had been in business in the city for more than 15 years. He was born in Ontario and before going West, engaged in the lumber business around Midland and Georgian Bay. He was prominent in church circles having been a trustee of the Sixth Avenue Methodist Church. He leaves a wife and three children.

Ontario Legislators Who Will Once More Go to the Polls

Geo. C. Hurdman, M.L.A.,
West Ottawa

Udney Richardson, M.L.A.,
East Wellington

James Thompson, M.L.A.,
East Peterboro

Lumbermen Will Again be Candidates

Geo. C. Hurdman, M.L.A., of Ottawa, will once more be a candidate for the Ontario Legislature at the next provincial contest. He has been nominated by the Liberals of West Ottawa. In 1914 he was elected to that body but so energetic has he been on behalf of his constituents that his candidature has been well received by both political parties. Mr. Hurdman was born in the Capital City and comes of good United Empire Loyalist stock. He is president of the Hurdman Lumber Co., Limited, wholesale lumber dealers, and also president of the Canadian Quarries & Construction Co. He has always taken a deep interest in military matters.

Udney Richardson, M.L.A., of Elora, has again been nominated by the Liberals of East Wellington as their candidate at the next provincial election. Mr. Richardson was first elected to the Ontario House in 1911 and for many years has been engaged in the retail lumber business. He also handles grain. Mr. Richardson was born in West Garafraxa township, is of Scotch descent and previous to becoming a member of the legislature was Reeve of Elora for two years. He has always taken an active interest in the work of the Ontario Retail Lumber Dealers' Association, as well as district associations. Mr. Richardson has been particularly watchful of the progress of the Mechanics' Lien Act, which the association had amended a couple of years ago and is desirous of having a new bill introduced at the session next year.

Jas. Thompson, M.L.A. of Havelock, Ont., has been nominated as a candidate of the Conservative party in East Peterboro for the provincial field. He is widely known in the lumber arena and has represented East Peterboro in the Ontario House since 1908. Previous to receiving legislative honors he was warden of Peterboro county and also reeve of Havelock for several years. Mr. Thompson has always taken a deep interest in agricultural matters and is highly esteemed throughout his riding. He is also president of the Monteith Pulp & Timber Co., of Toronto; the Toronto Investment Co.; the Thompson & Heyland Lumber Co., and other organizations. He resides in Havelock, Ont., but spends a great deal of his time in Toronto looking after his business interests.

Lumberman Left Large Estate

Property valued at \$330,041 was left by Frank Hillock, a Toronto retail lumber dealer, who died June 10, 1918, and whose will made January 17, 1914, has been admitted to probate by Judge Morgan, Toronto.

The personalty, valued at \$209,851, is made up of \$1,000 in household goods, \$37,330 in stock-in-trade, horses, \$350; book debts and promissory notes, \$9,389; mortgages, \$44,699; insurance, \$12,829, of which \$11,829 is payable to the widow; \$35,582 cash, \$2,268 paid on account of property bought at tax sales, which may be redeemed; \$78,223 in stocks and bonds, and \$108,359 in real estate. The realty consists of the lumber yards at 103 Albert Street, valued at \$91,475; 34-46 Oak street, \$6,939; 32-40 Power street, \$9,747, and a lot in McKellar township, \$200.

Will Enlarge Pulpwood Operations

The Meigs Pulpwood Co., Inc., whose head office in New Brunswick is at Campbellton, with branches at Cascapedia, New Richmond, and other points, are conducting extensive pulpwood operations, and during the coming season will carry on on a larger scale than ever.

The Meigs Company operate about 12 terminals and pulpwood propositions in Canada, and one of the terminals across the lake is at Oswego, N.Y. Four additional steamers will be put on the route carrying pulpwood from Quebec and New Brunswick to Oswego and other points. These steamers are now being loaded at Gaspé. Every cargo ranges from 1,000 to 1,500 cords of pulpwood. It is understood that the terminal at Oswego will have its present capacity increased.

Mr. Walter Meigs, president of the Meigs Pulpwood Co., Inc., recently paid a visit to Oswego and stated that not only would the storage facilities there be extended, but certain changes would be made in the conveyors and unloading devices at the plant.

Strike at Meaford Clears the Air

A strike of men employed in the yard of Seaman, Kent Co. at Meaford, Ont., took place recently. The men agreed to accept a sliding scale of 35c, 40c and 50c an hour for loading lumber at the dock, and from 35c to 40c an hour for piling lumber in the yards. The company are to have the right to employ what men they choose and to conduct piece work as heretofore. The men claim that the new scale will enable them to average from 45 to 50c an hour for day work. The company would not agree to dispense with piece work and the employees apparently are satisfied to forego this demand in consideration of an increase of from 5c to 10c an hour for work in the yards.

Empire Forestry Conference in London

An "Imperial Forestry Conference," which the British Government has definitely summoned to meet in London, England, next December or January, at the same time as the Empire Timber Exhibit.

The scheme of this Imperial Forestry Conference was suggested by Robson Black, secretary of the Canadian Forestry Association, to Canadian, Scottish and English forestry leaders several months ago. It was taken up readily and advocated by Sir John Stirling-Maxwell to such good effect that the British Government's new Forestry Department is summoning representatives from all parts of the Empire.

The Conference will consider the forest conservation situation in Canada and other Dominions as well as the British Isles, and will take up the question of forming a British Empire Forestry Association to act as a clearing house not only for information relative to Forestry problems and practices, but to promote inter-Imperial trade in forest products.

Building is Active in Canadian Cities

There has been no let-up in the value of building permits issued throughout Canada, and the total for the first seven months of this year is now nearly \$11,000,000 ahead of the total for the same period last year. Permits issued in July totalled \$8,132,278, a gain of \$2,270,731 over last year's total of \$5,861,547, and the largest amount of any month this year. These figures are for twenty-three Eastern cities and fourteen Western cities.

One of the most outstanding increases is shown by Windsor, which is now being invaded by numerous American firms seeking to manufacture their products in Canada. Last year permits were issued to the extent of \$78,610 in July, and this year's total was \$366,300, a gain of \$281,690. The figures for the first seven months of the year have jumped in Windsor from \$401,200 to \$1,124,530.

Twenty-three Eastern cities show a gain of from \$16,160,939 to \$25,593,638 for the seven month period, and fourteen Western cities increased from \$5,417,712 to \$6,637,019 during the same time, the total increase for Canada being \$10,652,006.

Spanish River Earnings are Large

Considerable progress toward putting the Spanish River Pulp and Paper Mills project upon a satisfactory working basis was made under the favorable conditions which prevailed in the paper industry during the year ending June 30, as indicated by the annual report which is now in the hands of the shareholders. Geo. H. Mead, of Dayton, Ohio, the president, refers to the completion of construction work and the proper balancing of the plants as referred to in the previous report as factors in giving the company its first annual opportunity to demonstrate its earning ability. The improvement shown and progress indicated does not, however, in the opinion of the board, yet represent an adequate return upon the very valuable resources of the company or the large amount of capital invested.

The total net revenue amounted to \$2,757,964, compared with \$1,729,231 in the previous year, and \$2,117,734 for the period ending in 1917. Reserve for depreciation took \$501,068, interest on funded debts \$799,975, and \$160,000 was appropriated for contingencies and taxes, leaving a balance of \$1,296,921, which, added to \$1,071,301 brought forward, makes a total balance of consolidated profit and loss accounts of \$2,368,322.

Coast Shingle Mills Enjoy Big Boom

Operators of shingle mills in New Westminster, B. C., and valley generally are enjoying the biggest boom of their lives with but one trouble on their horizon, and not a labor trouble at that, for most of the workers in shingle mills are Orientals. The only little difficulty is the scarcity of raw material. First class red cedar is scarce, and as a result the mills are using stuff that would not have got by in the old days. Any old piece of cedar that will make a bolt is going to the mill, and there is little wasted, bolts being pretty well up to the tree tops among the knots.

But as long as a mill can get material, it is working to capacity, and shingles are fetching prices that compare favorably with other items in the H. C. of L. Ordinary good shingles of the XXX grade are now over \$6 a thousand, and "perfections" have passed the \$10 mark. This represents a lot of money flowing into British Columbia, for most of the product is going over the line. It is estimated that at least 75 per cent. is being exported.

This is not all velvet for the mill, for bolts are worth as high as \$15 a cord, and there was a time when \$3 was reckoned a good price.

More Lookout Towers to be Erected

Twenty-three candidates lately passed their examination for forest rangers in New Brunswick. At a recent meeting of the Forestry Advisory Board of the Department of Lands and Mines, the report of the building of lookout towers and the laying of telephone lines was approved. A telephone line will be built this fall from Bathurst to the head of the Nepisiguit River, a distance of about 60 miles. The line will be laid in co-operation with the Bathurst Lumber Company, each paying half the costs. Another line will be laid on the same basis in co-operation with the New Brunswick Railway Company and will be run into the forest about 30 miles from Deersdale, York Co., on the N. T. R. It is also expected that two more lookout towers will be completed in New Brunswick before the snow flies. One of these will be located on Bald Mountain, Northumberland County, and the other on Blue Mountain, Victoria County. The forest service intended to erect four lookouts in different parts of the province.

From the 1st of September all restrictions have been removed upon the importation of pulp and paper into Great Britain.

Getting After the Pulp Business

The Canadian Mission in London, Eng., is securing publicity for the development of the pulp and paper industry in Britain. Prominence is given to the fact that the Dominion is the second largest pulp and paper producing country in the world, and is rapidly overtaking the United States, which occupies the premier position. It is pointed out that Canada's preeminence as a paper producing country lies in the possession of hundreds of thousands of acres of pulpwood forests, and of conveniently located water powers. Not only has Canada the largest forest area in the British Empire, but it is also shown that the Dominion has developed water-power estimated at 1,941,700 horse-power, besides unlimited water powers yet undeveloped. The Mission is desirous of developing this branch of industry, in order that this important trade shall be kept within the Empire, instead of British users of paper having to rely on foreign importations. The Board of Trade statistics indicate that there is ample scope for the further development of this trade. At present the trade between the Old Country and Canada is hampered by lack of shipping facilities. In spite of these difficulties there has been a steady growth in this branch of commerce. During the fiscal year ended March 31st this year pulp and pulp-wood to the value of \$99,259,166 were exported from Canada, compared with \$52,975,457 and \$63,486,222 in 1917 and 1918, respectively. Exports of mechanical and chemical pulp to the United Kingdom fell from 1,163,224 cwt. to 142,892 cwt. in the same period, owing to lack of shipping facilities. The Canadian printing paper imported in the United Kingdom for the fiscal year 1918-19 was valued at \$38,484, as against the United States' import of \$36,031,358 worth.

Death of Mr. Hiram Robinson

Many old friends in the lumber trade will regret to learn of the death of Hiram Robinson, who passed recently in Ottawa, in his eighty-eight year. The late Mr. Robinson who was born and educated in Hawkesbury, was for a long period connected with the firm of Hamilton Bros., lumber manufacturers, and for the past thirty years has been at the head of the Hawkesbury Lumber Co. He was also president of the Upper Ottawa Improvement Co., a director of the Ottawa and Hull Power Co. and other organizations. Mr. Robinson was for nearly forty years a school trustee in the Capital City and for half that time chairman of the Board and on his retirement from such long and faithful service was presented with a testimonial. The late Mr. Robinson was also a former Mayor of Hawkesbury and chairman of the Board of Health there and some fifteen years ago was president of the Dominion Forestry Association in the affairs of which body he took a deep interest. He was also a promoter of the Consumers Electric Co. and of the Ottawa and Montreal Power Transmission Co. and a director of the local branch of the Ottawa General Trusts Corporation. In his passing a highly respected and venerable figure in the lumber business has gone to his reward. He played a most important part in the development of the lumber industry of the Ottawa Valley.

Wealthy Lumberman Leaves Generous Bequests

The will of the late Robt. Cox of Robt. Cox & Co., Ltd., widely known Canadian lumber exporters, has been filed for probate in the Surrogate Court, Ottawa. The value of the estate is \$1,780,543. There are some twenty bequests, legacies and annuities left to various relatives, friends and employees of the deceased lumberman. St. Luke's Hospital, Ottawa, and the Bootle Hospital, Bootle, England, will get a half a million each. They will receive half of total residue of the estate and it is estimated that the amounts of the legacies, annuities and bequests, as provided for by the wealthy testator, will aggregate about \$400,000. The late Mr. Cox had financial holdings to the extent of between one-quarter and one-half million dollars in Canadian pulp and paper companies. The value of the estate held in the province of Ontario is set forth at \$418,075. Lady Grey Hospital, Ottawa, is also given a legacy of five hundred pounds sterling.

Alarming Forest Fires in France

Forest fires, always at this season of the year prevalent in the south of France, have become more or less alarming along a 30-mile front between Toulon and Nice. Already about 20,000 acres of woodland have been consumed. The wind, unfortunately, continues to blow with violence. The hamlets in Fumas, Campaux and La Male were destroyed. In one night the Dum forest, with big reserves of cork, was wiped out.

The conflagration spread to the seashore, reaching Canadel, where ex-Premier Ribot has property. His park was destroyed. Visitors to his hotel got away by motor car and on a tug sent by the Maritime Prefecture.

Economy and Efficiency

In Barking Pulpwood with The Moreau Barker

The Moreau Barker barks from two to three cords of wood per hour. Frozen logs in winter are handled as easily as dry wood in summer. Takes logs from 3" to 50" in diameter. Crooked logs are no objection to this machine. The Moreau Barker has a tension spring operated by the lever which controls the wheels according to the thickness of the mark and irregularities of the logs. This machine requires only 8 horse power to operate under all conditions.

Numbers of letters on our files testify the satisfaction the Moreau Barker has given many Canadian lumbermen.

We are prepared to prove the Moreau Barker equal to any work demanded of it.

Timber Lands For Sale

in the Province of Quebec, on the South Shore of the St. Lawrence, on tide water. Freehold lands 35,000 acres, Crown lands 60,000 acres.

An up-to-date sawmill is built, having a capacity of 40,000 to 50,000 feet of sawn lumber and 100,000 to 125,000 shingles.

For further information apply to the River Ouelle Pulp & Lumber Company, St. Pacome, Que. 17-20

Saw Mill Plant For Sale

Practically new and modern Saw Mill Plant, capacity about 30 Million feet per annum, located in the Interior of British Columbia on a beautiful inland lake and on the main line of the Grand Trunk Pacific Railway. About 500 Million feet of timber on and adjacent to Lake (about 90% Spruce) and another Billion feet available at reasonable prices. Natural conditions ideal for economical logging, manufacturing, piling and shipping. An advantage of about \$4 per thousand feet in freight rates to the Prairie Provinces over Coast shipments.

This property offers unlimited possibilities as a lumber, pulp and paper property. Would consider selling a half interest. Terms reasonable.

A. C. FROST COMPANY, 134 South LaSalle Street, Chicago, Ill. 5-t.f.

Virgin Timber For Sale

I have for sale, on very easy terms, in Virginia, 3,000 acres of Virgin Timber, mostly Shortleaf Pine, with some Oak. It is estimated to cut about 17 million feet of pine and oak, with a percentage of white wood, cherry and ash. Railway runs through the centre of it. The land will be worth \$50.00 an acre after it is cleared. Apply

DON. M. CAMPBELL, 15-18 Preston, Ont.

1300 Acres of Standing Timber FOR SALE

It consists of Birch, Basswood, Ash, Maple, Pine, Spruce, Cedar, Hemlock. Camps, logging equipment and sawmill on the ground; owner not a lumberman, engaged in other business. The said lands are located right on C. P. R. and C. N. R. sidings, six miles west of North Bay, better known as the Indian Reserve. Apply to

P. ADAMS, 15-18 North Bay, Ont.

Big Wood Ship Launching

With the launching of the Snoqualmie at the yards of the Puget Sound Bridge & Dredging Co., Seattle, Wash., one of the largest wood ships ever built slid down the ways. She is 330 feet long, 49 feet wide, 33 feet deep, and she has a tonnage of 5,000 dead-weight. She was designed by E. P. Geary, known in local yachting circles as "Ted" Geary, whose plans have been approved by the United States Shipping Board. She was christened by Mrs. Kate Borst, 89 years old, daughter of a Snoqualmie Indian chief and wife of one of the first three white men to settle in the Snoqualmie Valley. More than a hundred Snoqualmie Indians executed a tribal dance as a part of the launching ceremony. There was also an historical pantomime depicting the development of the Snoqualmie tribe since the coming of the white man.

Five wood steamships each of 4,200 tons, built by the Patterson-MacDonald Shipbuilding Co., have been bought by British interests, at \$520,000 for each ship, or a total of \$2,600,000. The price approximates \$124 a deadweight ton, as compared with \$100 a ton for the Ferris type ships owned by the Shipping Board. The ships are the Bellata, Bundarra, Bethanga, Birriwa and Berringa. The first three are in Chilean waters, the fourth is now ready for delivery after her trial trip a few days ago, and the fifth is receiving the finishing touches at the Patterson-MacDonald plant. The ships were built for the Australian Government. Each of them has a lumber carrying capacity of 1,750,000 feet.

The permit system for regulating settlers' clearing fires is working out, splendidly in Ontario. During 1918, 9,590 permits for the burning of slash by settlers were issued, as against 3,486 for the previous season. According to the report of the forest service the acreage covered by these permits amounted in 1918 to 39,683, as against 15,186 acres for the previous season. The permits are issued by the members of the fire ranging staff, and the Provincial Forester reports that generally speaking, the settlers co-operate heartily and appear to appreciate the wisdom of the new regulations.

The maximum number of rangers and supervisors was 1,190.

Review of Current Trade Conditions

Ontario and the East

The situation in the lumber arena remains steady and business is moving forward with considerable swing. All the wholesalers report that orders are coming in freely and that conditions are much more active during the present month than they were a year ago. Every grade of lumber is in active requisition, particularly hemlock and spruce, for house building purposes. There is still a great shortage in lath and dry stock is practically off the market, while green lath are being shipped in from various mills in Ontario as fast as they are cut. The market for shingles is exceptionally active, but the supply is short of the demand. The aviation of prices has for the time ceased, and it is thought that values have gone about as high as is possible. More carloads of shingles have been arriving of late than there have been for some weeks past. There is not much doing in the line of selling Coast or Mountain stocks in the East, owing to the abnormal call across the border and the high prices prevailing.

The export business is not particularly active at the present juncture, although space is more available. Exporters are inclined to the belief that before long rates will come down materially, and there is a disposition to go slow on the Old Country trade on the part of firms or other than those which have been doing an export business for years.

Building activity in some centres in the East has been interrupted by labor strikes just as things were getting under the full head of steam. There is still an uncertain atmosphere surrounding the whole lumber business. It is felt that 1920 costs will be higher than 1919, and all this means that the longer building is delayed the more expensive will be the structures put up. The outlay in building a home has now reached a figure that a few years ago would be counted as startling, but with lumber values practically doubled since the beginning of the war, the average builder thinks seriously before engaging in speculative undertakings. Not only in lumber but in everything else entering into the construction of dwellings prices have jumped enormously so that no one cares to make any predictions regarding the future. Everything in the shape of a forecast is likely to be upset by a shift in the labor, freight or cost of living situation.

Activity in building circles continues in Toronto and other leading cities. The value of permits issued in Toronto during August was \$1,844,303, making the total for the past eight months of this year \$10,362,590. An outstanding feature in connection with the permits is that the number of garages is increasing rapidly, no less than 185 being put up during the past month. There were also several additions to factories and warehouses. The increase in building permits in Toronto since the first of January shows nearly \$5,000,000 over the corresponding period of last year, or in other words, a jump of practically 100 per cent.

All woodworking establishments are busy at the present time, and the longer builders delay the higher prices seem to go. Some two months ago the quotation on all lines of doors was increased by 15 per cent., and now another advance is going into effect, the most recent raise being 10 per cent. on pine doors and 20 per cent. on hardwood. There have also been sharp ascents in hardwood flooring, particularly oak; clear 3/8 in. quarter-cut oak is now quoted at about \$190, while clear 3/8 in. plain oak is \$140.

The manufacturer, the wholesaler, the retailer and the consumer of lumber are asking when and where it is all going to end, and echo alone answers where and when? It is beyond the ken of mortal man to solve the problem or furnish a satisfying and authoritative response.

Great Britain

Surveying the whole market it is rather difficult to accurately gauge conditions. While prices generally remain firm particularly on imported timbers, with the exception of one or two lines, such as red gum, sap gum and oak, of which there is a generous supply, there is considerable uncertainty regarding the whole industrial situation, due to labor disturbances, the national cry for rigid economy and the uncertain political outlook. August was a decidedly quiet month and merchants were engaged in making arrangements for receiving the wood purchased long before in the spring. Most of them found quite enough to do in storing or in delivering against outstanding orders.

Speaking of matters as it finds them, the "Timber Trades Journal" says: With prices at their present height, merchants will not

accumulate stocks; and when the inducement to do so is only a saving of a couple of pounds per standard at the outside, business scarcely increases by such a concession. For instance, some of the Finnish specifications containing the proportionate 9 in. are offering on the basis of £29 for 7 in., and £29 for 3 x 9. These figures are cheap compared with Swedish at £33 and £35 respectively, but even £29 for Finnish 7 in. is felt to be a dangerous figure unless there is a good prospect of prompt sales.

Several other correspondents write this week that the market is decidedly weaker, and that spot prices are generally on a lower level. We believe this to be a fact; but we think it is merely a market fluctuation, and that the causes are easily discernible. The revival in trade continues slowly; but hitherto the consumption, small as it has been, has still been strong enough to absorb the meagre supplies which have been imported. But suddenly, towards the end of July, and during the first part of August, a stream of boats arrived almost simultaneously. Labor is difficult, barges are scarce, and there are no adequate facilities for dealing promptly with the wood. Parcels which arrived unsold, therefore, are being placed at the best prices obtainable, and those merchants who have held off until the last moment are enabled to do business at a very favorable juncture.

In regard to American hardwoods the conditions are stable and the market firm. While there has been a slackening up in a few lines owing to the strikes in the cabinet making trade it is felt that as soon as the industrial community begins to realize its responsibilities to the rest of mankind, business will take up a new lease of life. Much will depend upon the greatness or paucity of supplies in American hardwoods in regard to future prices:

The market for all kinds of mahogany is firm, and there is very little stock coming forward. The recent advance in freight rates from West African ports will no doubt prevent the importers from shipping as many logs as they would otherwise have done, because after all if the market was flooded with stock, values would certainly have the tendency to fall irrespective of freight rates and charges. The next mahogany auction sales will be held on September 11. The catalogues are not likely to be heavy; in fact, if they are on the same par as the previous sales, there will not be sufficient stock offering to meet all the requirements of the market. If this should prove the case, then values will not diminish, but are likely to advance still higher in view of the paucity of supplies, and the recent rise in freights.

In a recent edition a leading London paper says: "Looking ahead," said a high port official, "we think we can see daylight. The one danger point is in regard to the large timber consignments that are coming on the Government account for housing schemes. A million tons are to come from Canada. This will no doubt be distributed to various ports, near to the localities where it is needed, but we shall get our share. If it is shipped in steamers that do not require deep-water docks, it will not matter so much, but, otherwise, it will need lighters to move it to the places where it will be stored, and that will accentuate the shortage of lighters for general cargo."

In London the housing scheme is dragging on its way. If it ever gets into its stride huge quantities of battens chiefly 2 in. will be required. These are at the present time much neglected.

In floorings 7/8 in. is scarce, and merchants show no disposition to import any yet, this thickness should largely enter into the scheme for floors, etc. Laths, poles and putlogs are very limited, and a few good orders would clear all that are at present in stock.

United States

Firmness characterizes the general tendency of the lumber market. The upward tendency in prices still continues. In some centres building activities have ceased owing to strikes and lock-outs, but as time proceeds the general industrial situation is becoming more encouraging and the number of labor troubles lessening. One leading firm states that the railroads, labor demands and foreign exchange are the big problems of the day which must be settled before business can be expanded.

In the hardwood line the supply is still short of meeting the demand. Furniture and vehicle plants are doing an excellent trade, and it appears almost impossible to satisfy their wants. The general industrial demand is steady and operators need have no fear of the future, but can direct their attention along the line of increased production.

The car situation in the west is none too good, and many firms

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. BOLE, Pres. F. H. GOFF, Vice-Pres. E. C. BARRE, Gen. Mgr. W. A. SAURWEIN, Ass't. Mgr.

are behind in deliveries. It is feared by some that the conditions may become worse than a year ago on account of the general uneasiness in railway circles. The recent strikes put equipment in a bad way and the result is now being felt. The situation, however, is very uncertain and makes it a rather wild guess as to when business in the transportation line will become normal. The demands in the country lumber yards are growing faster than the dealers are able to get new orders filled or get shipment of old orders. The lumber market has steadied down to a considerable extent during the past few weeks. This may be due to the efforts on the part of the governmental authorities to reduce the cost of living. This has acted upon labor in such a manner that some of the radical demands for wage advances have ceased, and this, of course, eliminates the necessity on the part of the mill men to get more money to make ends meet.

But the excess of demand over supply will prevent any immediate drop in lumber prices, and, with the demand for housing facilities far from satisfied, and the certainty that the demand will not be met this year, it is hardly to be expected that there will be a decline in the market level during the coming winter, or next spring.

A continued heavy demand for practically all items is the feature of the southern pine market. There is an especially heavy run on small dimension, coming from southern as well as from middle western consuming centres, which is taking up all such stock as rapidly as it can be manufactured under the present none too favorable circumstances. Heavy timbers are also moving in heavy volume and the demand for this class of material seems to be increasing daily. Large orders for sawn timbers from South America and other foreign markets are reported to have been received lately, and deals in 3x9 and 4x9 inch sizes are in heavy demand. A feature of last week was the leaping into the limelight of No. 2 common flooring, with offerings that have by far exceeded expectations and a call

that is in excess of the supply. In fact for the higher grades of all dressed stock there is a very strong and healthy demand which exceeds the supply, with the result that there are no stocks worth mentioning left at the mills.

Some dulling of the sharp edge of quotations has been felt in the wholesale shingle market during the past week, though retail trade gave evidence that there are still many well filled private purses. The present inflated condition of the market would have given way to a more pronounced decline had the car supply been normal and the shipping facilities equal to production, which, while not large by any means, is fully equal to the demand. Consumers, rebellious at prices charged, are seeking and finding substitutes. This fact, well known to large producers, creates no present uneasiness since cedar logs are valued for their yield in sheathing lumber and siding, the latter being decidedly scarce with a rabid demand.

A recent despatch from Washington conveys the following interesting information with respect to export rates: Walker D. Hines, director general of railroads, has to-day issued instructions for the preparation of tariffs which will provide for class and commodity rates upon export traffic from points in Ohio, Indiana, Illinois, including cities located on both banks of the Mississippi River from Dubuque, Iowa, to St. Louis, inclusive, also from points in the southern peninsula of Michigan to south Atlantic and Gulf ports from Wilmington to New Orleans, inclusive.

When the tariffs have been prepared the matter will receive final consideration in Washington. The export rates to be established will be substantially the same as the rates which apply to New York on domestic freight from the same points of origin. The export rates to Key West will be the usual differential above the south Atlantic ports. Special consideration is to be given to export traffic when destined to Mexico and Central America, because of the generally low ocean rates from Gulf ports to those countries.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Conditions in Ottawa Show Good, Steady Trade

Little by way of general change regarding prices, orders, or inquiries was shown in the Ottawa lumber market during the opening period of September. The noticeable feature of improvement was in the woods labor situation. Bushmen became more plentiful and the camps filled up well with prospects of a good season.

Orders and inquiries on the whole did not show much change, and remained steady as compared with the last two weeks of August. There was a fairly good demand (principally from the United States), the grades being mill run and better in pine and spruce. Spruce, if anything, showed some improvement, and the pine grades held firm.

Export business to points other than the United States did not alter. The shortage of bottoms handicapped to a certain extent shipments to South America. The South African demand and that to Europe remained stationary. Advices from exporters showed that the big majority of shipments going to European ports were still on Government account.

Lath and shingle continued in good demand and the market was not overcrowded with any surplus stocks. The sawmill cut of the Ottawa Valley this year, as was previously predicted, will hardly be as large as last year. There were fresh indications in support of this, as some of the mills already have closed down owing to shortage of logs occurring at the mill. The deficiencies in supplies are attributed principally to two causes—one that low water has stranded many of the logs before they can reach the mill, and the other that the decline in the woods log output during the last two years is making itself felt. There are not as many logs in the streams to come down as during a pre-war normal season.

The sawmill cut for the valley is already pretty well sold, and indications are that with a light cut there is not going to be any surplus stocks of the staple grades on the market next spring. This would naturally have a tendency to sustain present prices, if they do not show a further advance before then. Some members of the trade believe that certain grades of stocks have not yet reached their highest levels.

Business on the whole was considered by lumbermen to be pretty fair and, while they generally agreed that no great boom was on, they felt that a steady trade was developing. The business which was dull during the war period, is gradually and steadily coming back. A fair amount of trade was done in the building grades with a good portion of the stock being used for repairs.

Reports concerning the woods camp operations were the principal features. Though the number of men offering to go to the woods was greater than during the closing period for August, it was problematical and difficult to judge if the quality or standard in woodsmen's efficiency was increased? Generally the reports to the "Canada Lumberman" were that camp operations were going ahead well, and given an even break with the weather and the health of the men in the bush the log output of the Valley should be considerably increased this season.

Outlook Good and Prices Holding Firm in Montreal

Speaking generally, Montreal lumber market conditions are satisfactory. Orders for the States are still good, the only difficulty being the scarcity of cars, and consequently slower deliveries. The outlook for further business is fine. Prices are holding very firm, and the chances are all in favor of a yet higher range of values.

B. C. lumber is not selling very freely, consequent on the very stiff advance in rates. An excellent market had been created for Western stocks, but the phenomenal rise in prices, owing to the demand for American account in the West, has tended to choke off Eastern buyers, who are not, as a rule, prepared to pay the heavy rates prevailing.

Local business has picked up. Unfortunately, however, a general strike of the building trades has been called, although the men have not fully complied with the order to quit. The reason for the strike is the usual demand for more money and shorter hours, some sections asking for an advance of 50 per cent. in wages. The demand for lumber in the province is very good.

Building permits for Montreal in August totalled \$1,541,245, an increase of \$482,981. For the year the value is \$5,913,680, a gain of \$2,205,790.

A large quantity of Government lumber continues to go forward to the United Kingdom. The shipments from this port will probably be completed by the end of this month and those from Quebec during October. Heavy shipments are also being made from the lower ports, notably from Campbellton, by means of tramps. During the winter, the lumber will be sent from Halifax and St. John. Practically all pine is shipped from Montreal and spruce from Quebec and the lower ports.

Exports of pulpwood show a decided declining tendency. For the month of June they were valued at \$788,326, a falling off of \$1,118,114; for the three months of the fiscal year they amounted to

\$2,025,714, a decrease of \$1,952,656. While newsprint exports grow, chemical and mechanical pulp have fallen back. Chemical pulp declined \$1,105,652 in June, and \$2,515,616 in the three months; mechanical increased \$295,818 in June, but declined \$47,308 in the three months.

St. John Complains of Slow Transportation

The last two weeks has seen no change in the lumber business at St. John excepting that the sawn lumber is not moving out as briskly as it was. Transportation both by water and rail is still the cause of this retrenchment, for if cars were available, fair sized orders have been sold to go forward to United States points and could be delivered but for the shortage in foreign cars as the Canadian Pacific and Canadian National roads still refuse to allow their cars to go out of Canada. The railways now claim that more foreign cars will be delivered over into Canada in the near future than has been the case during the last two months. Should St. John get its fair proportion of this amount then larger quantities of stock will move forward. Water transportation still continues scarce and hopes for immediate help are not good. Buyers are not as much in evidence as was the case a month ago and enquiries are also not as prevalent. This applies more to English cross water business as the exchange rate of the £ sterling being so low causes buyers on this side to hesitate as to future purchases. What the outcome may be remains to be seen. Certainly the lumber merchant who is a manufacturer, cannot go on and cut logs this coming winter and expect to sell sawn lumber at lesser prices than during the past few months. He will have to have them and more if wages advance. The possibilities of logs being cut at less than last winter's prices are very remote as logging contractors are asking higher figures than ever before.

Should nothing prevent it the mills at St. John expect to get only a normal cut of logs this winter as no one knows what is in the future. It is certainly too great a risk to take under present conditions. Local business is just fair, local prices remain unchanged and no great amount of house building has as yet been started but the future looks rather bright. American prices remain unchanged, laths and shingles being very much in demand at good quotations. All the St. John mills are still running but unless water comes within the near future some must shut down as between five and ten million feet of logs are still held from Grand Falls to the booms and heavy rains will be required to bring them out.

Commercial Aviation for Timber Surveys

As announced in a recent issue of the "Canada Lumberman" aerial surveys are making rapid progress and a leading concern in Annapolis, U. S., now announces that it is prepared to make photographs and survey timber, pulpwood, water areas, cities and towns by aeroplane, in Ontario, Quebec, eastern provinces and United States, and also to detect and report on forest fires. The company states that it will furnish aeroplanes for a number of other purposes including distribution of advertising of either a private or public character. Its equipment is complete and an efficient staff is maintained.

It is announced that members of a Boston expedition recently concluded cruising in aeroplanes over Labrador and that great timber lands were disclosed. From these lands millions of cords of pulpwood could be cut and rolled to streams for direct shipment. The extent of the discovery of the timber land was 2,000,000 acres and pictures taken from the air, numbering some 1,300, portray dense growths of pulp material in such a manner that the most available places can be readily located. The planes in their survey flew at a height from 2,000 to 9,000 ft. and sailed inland for more than 100 miles.

The success of the Labrador expedition is such as to justify the faith of aerial survey companies that commercial aviation by the use of aeroplanes is no longer regarded as a possibility but among the real accomplishments of the near future.

Erecting Many Houses for Their Men

The Spanish River Pulp & Paper Mills are erecting thirty new houses and two large boarding-houses at Espanola, Ont., in order to domicile the increased staff of the company, which now employs in all 6,750 men. Of these 5,000 are engaged in woods operations; 800 in the plant at Sault Ste. Marie; 500 at Espanola, and 450 at Sturgeon Falls. It is announced that the daily consumption of pulpwood by the industries of the Spanish River Pulp & Paper Mills is 750 cords and the output of the organization is 460 tons of newsprint, which will shortly be increased to 560; groundwood pulp, 400 tons; sulphite pulp, 220 tons, and board, 35 tons.

The Abitibi Power & Paper Co. are putting up fifty new houses for their workmen at Iroquois Falls, Ont., where large extensions to the plant will soon be carried out.

The Mark of Quality GLOVES

Manufactured from the first grade leather (tanned in our plants) well stitched and full sized, our gloves and mitts are a representative product of a house whose output is deserving of the name—ACME.

TEA

This is a line that is more important in the camp than many lumbermen realize.

The men must have good tea, not good in one way only, but in every way. It must have strength and also flavor. In our Camp Blend, which is put up specially for the purpose, we feel sure that we have a tea which

is good all round quality. It has snap and at the same time is very palatable, in fact some of its users go so far as to say there is a kick in it. At any rate, whatever it is, it's giving splendid satisfaction, and we would like to add you to our list of satisfied users of Camp Blend Tea.

The McAuliffe Davis Lumber Co., Limited, Ottawa, recently sustained a small loss by fire. The amount of the damage was fully covered by insurance.

Brockville Paper Mfg. Co., Limited, Brockville, have been incorporated to manufacture and deal in paper, pulp, pulpwood, lumber and wood products. The capital stock is \$250,000.

Joseph Dolan & Sons, Limited, Ottawa, Ont., have been incorporated to carry on in all its branches a general pulpwood, lumber, logging, and timber business and to acquire and operate all the necessary mills and other plants. Capital \$50,000.

Lewis & Turville, Limited, St. Thomas, Ont., have been incorporated to manufacture and deal in lumber, lath and building materials of all kinds. E. A. Lewis and B. C. Turville, both of St. Thomas, are among the incorporators. Capital, \$40,000.

The Camden Paper Mills, Limited, of Camden East, Ont., are now in operation under the charge of E. S. Crabtree who is manager of the plant. The company are turning out some building paper but will be manufacturing kraft in the near future.

Canadian Sander Mfg. Co. Limited, Brockville, Ont., have been incorporated to manufacture and deal in all kinds of machinery, builders and mill supplies, patterns, lumber and building material and to carry on the business of pattern makers, mill workers and machinists. Capital, \$20,000.

The plant of the Bishopric Wallboard at Brookfield, Gloucester township, near Ottawa, was recently destroyed by fire. The industry was completely wiped out and the loss is about \$300,000. Three freight cars, two C. P. R., and one G. T. R. on a siding at the factory, were also burned.

International Bushings, Limited, Toronto, Ont., have been incorporated to manufacture and deal in articles composed of or manufactured in whole or part from iron, steel, metal, wood or other combination of metals. Capital \$25,000,000. R. P. Locke, barrister-at-law, is one of the incorporators.

The old Central Prison, Toronto, is being demolished by the Grand Trunk and Canadian Pacific Railways. The prison was built in 1873 and the railways will lay tracks where it now stands. The brick and stone work is being taken down and the lumber which is in good condition although 46 years old is being sold.

A new company, capitalized at \$1,000,000, including 5,000 shares of 7 per cent. cumulative preferred and 5,000 common shares, has been incorporated under the laws of the Dominion and will be known as the Wendigo Power Company, with head office in Guelph. The company's plant will be located some 20 miles south of Larder Lake. The purpose of this company is the development of hydro-electric power on Wendigo Lake and certain parts of the Blanche River.

A provincial charter has been granted to Modern Dwellings, Limited, with a capital stock of \$100,000 and head office in Oshawa. The new organization is empowered to erect dwelling houses of all kinds and deal in building material and to purchase, lease or take in exchange lands or interest therein and any buildings that may be on the said sites and sell, exchange, mortgage or otherwise dispose of the whole or any portion of the lands and all or any of the buildings.

A large and representative Industrial Conference was held this week in Ottawa. There were many delegates from the various industries. The lumber and timber interests were represented by Angus MacLean, Bathurst, N. B., J. Fraser Gregory, St. John, N. B., and Fred I. Booth, Ottawa. For the pulp and paper division F. A. Sabbaton, Grand Mere, Que., and P. B. Wilson, Sault Ste. Marie, Ont., and for the shipbuilding, H. B. Smith, Collingwood and R. W. Wilson, Halifax, attended.

The Galt Housing Commission have decided to build six houses. Action has been delayed owing to high tenders, but the commission has now succeeded in getting contracts within the \$3,500 limit set by the Ontario Housing Act. Three of the houses to be built will be two-storey, brick veneer, while others will be a story and a half, stucco finish, and will sell at a lower figure. All houses, however, will have all conveniences and it is expected when these are complete the Commission will soon sell others of the same style. Building operations to date in Galt show an increase of over \$100,000 in value over last year.

Eastern Canada

The Duke and Duchess of Devonshire inspected the mills of the Laurentide Co., Ltd., while on a visit to Grand'Mere, P. Q.

The foundations for the new sulphate pulp mill which is being erected by Clarke Bros., Limited, at Bear River, N. S., have been completed.

H. Peladeau, Limited, 1211 Ontario St., E., Montreal, whose lumber yards were recently destroyed by fire announces that he will not rebuild on this particular site.

Omer Lamothe has begun the erection of a new saw mill at St. Louis de France, Champlain County, Que. The mill will be 53 ft. x 24 ft., 1½ storeys high.

The Foundries Building & Supplies Co. have been incorporated to acquire, develop and sell real estate, timber licenses, timber lands, standing timber and manufactured lumber. Capital \$100,000.

J. P. Abel, Fortin, Limitee, Montreal, have been incorporated to take over and carry on as a going concern the business now conducted in Montreal under the name of J. P. Abel, Fortin & Cie, box manufacturers and lumber merchants. Capital stock \$200,000.

The staff of the Canadian Export Paper Co., Montreal, spent Labor Day at Grand'Mere, P. Q., as the guests of the Laurentide Co., Ltd. The party

visited the nurseries, were entertained at a lumberjack's dinner at the log sorting camp, and inspected the pulp and paper mills.

Shipbuilding is continuing active at various towns. In Parrsboro, N. S., W. R. Huntley & Son have laid the keel for a four masted 600 ton schooner and the Valley S. S. Co. have awarded a contract for a large schooner which will be built at Meteghan River, N. S.

The Parker Creek Lumber Co., Montreal, P. Q., have been incorporated to own and operate saw mills, shingle mills, lath mills and pulp and paper mills and to carry on the business of lumber merchants and manufacturers.

Notre Dame Lumber Co., Limited, Notre Dame du lac, P. Q., have been incorporated to manufacture and deal in lumber, wood, and all wood products. Capital \$100,000. F. G. Quincey, Notre Dame du lac is one of the incorporators.

The Harbor Commissioners of Montreal have recently received tenders for timber for the construction of crib work. The quantity supplied will include crib work, construction timber, shipbuilding timber, B. C. timber and railway ties.

A launching took place recently from the shipyards of I. M. Comeau & Co., of Little Brooke, Digby, when the splendidly built four-masted schooner Charlotte Comeau was put afloat. The Charlotte Comeau is one of the largest schooners to be built in that section, measuring 172 feet over all, 156 ft. keel, 37.4 wide, 13.4 deep, 728 net and 799 gross tons.

A handsome four master vessel, Harry A. McLennan, was launched recently at Campbellton, N. B., at the McLennan ship yards. The name was given in honor of the eldest son of Mr. and Mrs. Alex McLennan who gave his life in the great war. The vessel is 186 ft. long, 35 ft. beam and net tonnage 719. It is nearly 60 years since a wooden vessel has been launched at Campbellton.

The Peaceland was recently launched at Annapolis Royal, N. S., by the Annapolis Shipping Co., being the smallest vessel built there in a number of years. The Peaceland, however, is a very pretty model and a handsome well built craft, her keel being 100 ft., beam 29 ft. and net tonnage 261. She has three masts and top masts complete. As soon as more timber can be accumulated another vessel of a larger type will be built at Annapolis Royal.

A new industry will shortly be in operation at Mullins Brook, York County, N. B., and will turn out hardwood last blocks. The promoter is H. Mobbs, of Kettering, England, one of the largest manufacturers of last blocks in the world. It is expected that 3,000,000 ft. or more of hardwood will be manufactured by the end of the year. The newcomers have entered into an arrangement with the Nashwaak Pulp & Paper Co. to use that quantity.

Western Canada

Pitt River Shingle Mills, of Port Coquitlam, B. C., are planning the erection of \$30,000 mill.

Lumber sold by the Canadian Western Lumber Company, Ltd., in June, was 11,217,000 board feet, valued at \$303,437. The increase over last year's figures for June was \$49,562.

H. D. Hyde, formerly manager of the Fraser River Shingle Co., has left Vancouver for Dallas, Texas, where he has been appointed manager for the south western branch office of Morse, Green, Limited.

The Pitt River Shingle Mill was burned to the ground recently. Dry kilns were saved. Alderman Wilson got the Port Coquitlam fire truck out and with a volunteer crew prevented the fire from spreading to the kilns.

The Georgetown Spruce & Cedar Co., Limited, Georgetown, B. C., have been incorporated to take over the business and assets of the Georgetown Spruce Co. and to continue a general lumber and manufacturing business.

Building permits issued in Winnipeg during July amounted to nearly \$750,000. This is twice the value of the permits for the corresponding month of last year. The amount represented by building operations in Winnipeg since the first of the year is \$1,500,000.

After having spent over three years on the battle front, some time as a private and the balance of the period as an officer, Ben. H. Babbitt is back in Canada again, and is now representing the "Service" Lumber Company of Vancouver, in Winnipeg.

Sir George Bury, president of the Whalen Pulp & Paper Mills, Limited, left recently for the north to inspect the company's large plants at Swanson Bay and Port Alice. He visited the Queen Charlotte Islands, where his company is taking out 50,000,000 feet of timber this season.

The scarcity of vacant houses in Victoria has caused many persons to repair old structures which have been unoccupied since the collapse of the industrial boom. As the result of building activities the mills have experienced an unusually big demand for lumber to be used locally.

An important addition to its plant, in the form of a spur track to connect its yards with the Esquimalt and Nanaimo Railway system, will be installed shortly by the Canadian Puget Sound Lumber and Timber Company, Ltd., which recently commenced operations in Victoria.

The steel steamer "Canadian Trooper" recently loaded 806,000 ft. of lumber at Fraser Mills, B. C., this being another shipment of the big order of 70,000,000 ft. for the united Kingdom, on which practically all coast saw mills have been working. It is now estimated that about 12,000,000 or 15,000,000 ft. of the order has left Vancouver.

Loomis, McFee, Henry & McDonald, Limited, Vancouver, B. C., have been granted a Dominion charter. Wide powers were granted, such as to carry on the business of general contractors, to manufacture and deal in timber, lumber, sash and doors, portable houses, boxes and all articles made of wood. Capital \$500,000. J. S. Pugh, barrister, Vancouver, is one of the incorporators.

Another mill will shortly be added to the list of the active lumber organizations in Greater Vancouver. This is the E. C. Walsh Lumber Company's new plant, which is to operate on the north shore of Burrard Inlet, just to the east of the Wallace shipyards. The mill, which is nearing completion, will cater chiefly to the export trade and has excellent facilities for shipping by water or by rail.

Canford is losing a sawmill and Merritt is gaining one. This is as a result of the determination of the management of the Nicola Pine Mills, Ltd., to remove from the first mentioned place to the latter, and work is proceeding rapidly to effect the change in the quickest possible time. The work of grading, track-laying, and construction has been going ahead as fast as it is possible for men to do it at what is known as the Central Yards, Merritt.

Coe Veneer Equipment

The Most Efficient Dryer You Can Install

Will dry green veneer of any thickness from 1/4 in. down, within a few minutes from being cut, and deliver it uniformly bone dry,—flat, without checking, marking, splitting, discoloration, or other drying effects. It is a machine that is essential to rapidity, economy and quality of output.

Why not have our catalogue of the complete line of Coe Veneer Equipment?

**THE COE MANUFACTURING
COMPANY**

Painesville, Ohio, U. S. A.

The oldest and largest manufacturers of veneer cutting and drying equipment in the world.

Keep in Close Touch with Building Conditions

Lumber, being one of the most important construction materials, is closely connected with the building trades. You can keep in touch with the progress of construction by reading the "Contract Record and Engineering Review." It is published weekly and gives you the latest developments in the building world.

Why not become a regular subscriber—only \$2.00 a year brings it to you for fifty-two issues? Order direct from the publishers.

Don't Forget Last Winter

Make Sure of Your Feed Supply

CANE MOLA

"The Ideal Feed for Live Stock"

Using
CANE MOLA

*Good for Cooking, Too!
Makes Dandy Ginger Cakes*

Sprinkle Cane Mola on old hay, straw, screenings and mix with grain in the feed box. Dry, untempting feeds are made palatable and digestible and are eaten up to the last atom when fed with Cane Mola.

Cane Mola is not a prepared stock food—just 100% Pure Sugar Cane Molasses. It contains just enough natural salts to keep your live stock in healthy condition.

Horses Thrive on Cane Mola
Horses fed with Cane Mola are free from Colic, will winter at hard work and finish in excellent condition in the spring. This has been demonstrated in a number of lumber camps.

Shipped in strong iron hooped barrels at a reasonable price. Write for samples, prices and booklet on economical feeding.

Good live agents wanted everywhere.

EXPERIENCE-The Master Teacher of McClary's

For over seventy-two years, experience in Stove making has been garnered in the cells of McClary's brains. Every lesson, both bitter and sweet, has found its use and practical application. We see the ultimate result in the present-day perfection of all McClary's products, and none more pronounced than the

"Camp Comfort" Box Stove

As its name so forcibly implies, this Stove is for Camp use. No matter what manner of Camp it may be, so long as a number of men require to be warm and comfortable, the "Camp Comfort" will meet every exacting want. It will stand the stress and strain of the logging Camp, and when not in use will occupy the minimum amount of storage space.

It has a one-piece Steel Body, a cast iron front and a stamped steel back end.. Large feed door with draft slide. Legs of heavy cast-iron set in powerful cleats holding body rigid. Equipped with either top shelves or side shelves as ordered.

An enquiry at the nearest McClary's dealer or a line to our nearest Branch will bring you full information. Act to-day while we can ship promptly.

Hose was hose — Till Goodyear Built it

THE GOODYEAR CORD TIRE of to-day would not have been possible had Goodyear been guided by the hide-bound traditions of the rubber industry.

Nor could Goodyear Industrial Hose ever have reached its high degree of perfection.

But Goodyear refused to be bound by precedent or trade prejudices. Hose fit to meet modern industry's varied and severe demands was our goal. Prevailing methods of construction would not do. Better methods had to be developed.

It was typical of Goodyear to study the hose requirements of industry exhaustively—to want to know exactly the conditions industrial hose must meet in use.

To discard existing processes of hose building, rubber compounds and cotton specifications and set new and more exacting standards—to de-

velop more modern processes and methods of construction.

So you are offered the more efficient Goodyear Industrial Hose—hose that embodies all the virtues demanded by the strenuous needs of 20th century industrial life.

For foundry, paper mill, mine, railway, steel plant and every other industry there is a Goodyear Hose that will meet your needs more exactly; that will give more lasting service.

Goodyear Industrial Hose will open up to you new possibilities of economy, increased production and hose satisfaction.

A man trained by Goodyear in hose problems will gladly call upon you without obligation.

Just phone, wire or write the nearest branch

Does Labor Saving Machinery Pay ?

Last Fall a certain lumber concern in Ontario purchased a small 10 H.P. Double Drum Belt Driven Hoist from us for handling logs. This machine cost them \$550, plus \$25, freight, total \$575. They operated this small Hoist by a belt from a gasoline Engine, the whole making a light, compact, portable outfit, easily moved from place to place.

They were able to work this outfit in the coldest weather, and found that it did the work of three or four teams.

As it required only one man to operate the Hoist, it is easy to figure the daily saving

effected by the use of this machine. In other words, compare the wages and board of one man and the cost of a little gasoline with the wages and board of four drivers and the feed and upkeep of eight horses.

You will readily see that it would not take long to pay for the cost of the machinery from the savings effected in the cheaper handling of the logs.

Our Booklet "Suggestions for the Lumberman," tells a number of up-to-date methods of using this labor-saving machinery for moving logs. You may have a copy for the asking if you have not one already. Just drop us a card.

GOODHUE BELTING

FACTORY TO YOUR MILL

TO the saw mill and woodworking industries we offer an unusually good belting value in our "Acme Waterproof." This belting is specially made from the best hides to run in wet places where only the best quality belt can "make good." If you require any belting you should enquire into the merits of "Goodhue Belts," then you will buy a "Goodhue." According to the conditions under which the belt has to run, we recommend "Extra," "Standard" or "Acme Waterproof"—each brand the best quality, but each made for a different service

BELTING STABILITY

There has been such uniformity of satisfaction following the selection of

DUNLOP

"Gibraltar RedSpecial"

—"THE ORIGINAL RED RUBBER BELT"—

that we feel our quarter-century policy of "Keep the Quality Up as Well as the Production" is being amply rewarded.

"Gibraltar RedSpecial" faces any kind of a test unflinchingly. The man who wishes to talk power, "duck," or elasticity can find ample sway for his talents in a comparison of "Gibraltar RedSpecial" with any other belting.

Minimum loss of power, Mastery of heavy loads and jerky strains, Highest quality of friction uniting the plies, Adequate weight, No Stretching—these are some of the virtues of Dunlop "Gibraltar RedSpecial" Belting, proven in thousands of cases of actual use on Main Drives in Pulp and Paper Mills, Saw and Lumber Mills, Mines, Steel Plants, etc.; in fact, in any and every kind of transmission work.

THE DUNLOP UNRESERVED GUARANTEE

If you have a difficult drive anywhere in your factory drop a line to our Head Office, or to our nearest branch, and we will send a man experienced in belt engineering to consider your requirements. If it is an instance where "Gibraltar RedSpecial" Belting may be suitably employed we will recommend its use; and we will stand behind our recommendation with the fullest guarantee ever issued by a firm producing rubber products.

LINK-BELT

Saw Mill Chain

FOR elevating and conveying purposes, for medium and high-speed power transmission, for work of a crude nature, and for work requiring the highest possible efficiency and greatest accuracy, we are prepared to furnish types of Link-Belt of such construction and possessing such qualities as make them the most desirable for the service expected of them.

By reason of the long-continued maintenance of such high standards of excellence, insured by rigid tests and careful inspection given to every foot of Link-Belt, by a skilled chain-making organization; and our large available stocks; we have developed our line of saw mill chains to a high

standard of quality. We solicit your business on the basis of quality and service.

Look for this trade >—< mark on each link. It identifies the genuine Link-Belt—every link of which is guaranteed.

Write for our Saw Mill Link-Belt Catalog No. 260.

Special Small Saws and Groovers

From Summer Pastures to Your Winter Camp

When the cows are out to pasture and their production of milk is greatest the Klim plants experience their busiest season. Every morning heavily loaded wagons may be seen coming to these plants with fresh milk.

From these great quantities of milk, fresh from the farm, Klim is made. After pasteurizing the milk, and separating it by modern machines to remove the fat, our "Spray" process removes the water by evaporation and the milk solids, or food portion, become a fine dry powder—Klim. This is accomplished without changing the flavor or lessening the food value. The fine dry powder is at once packed in the blue-and-white-striped tins which eventually reach your camp.

Whip Klim into water according to directions on the label and use just as you would fresh milk for cooking and baking and in tea, coffee and cocoa. Your men will enjoy its natural flavor and you will find it most economical for camp use.

At all wholesale grocers in 10-lb. tins.

TAPATCO
REGISTERED BRAND TRADE MARK

The Collar Pad that Keeps a Horse Fit

It prevents injurious friction by protecting the horse's neck, and therefore removes all possibility of sores, chafes and galls.

The best material and skilled workmanship, backed by 38 years of experience, are good reasons for the reliability of TAPATCO Collar Pads. The patent hook attachment is also a feature that makes their service longer, as it makes possible their use long after the cloth has been weakened by constant wear.

You Want a Glove Like This

It will give excellent wear, and keep your hands warm. Fits fine and allows perfect freedom of movement. This glove has given splendid service in the lumber camps.

All jobbers carry these goods.

The Carriage You Are Looking For

Our No. 1 Size

CARRIAGE—Has three head blocks, as shown in cut, usually set 9 and 6 feet apart, will be placed any distance apart to suit purchaser. Knees open 38 in. from saw, and is fitted with Knight or Peel dogs, as desired. Taper movement on each knee. 1 15-16 in. steel set bar with steel pinions and coil spring receder, and friction lever brake for stopping knees where required. Timbers are 5 x 6 in., or heavier if desired, well bolted and braced. Diameter of truck wheel, 12 in. Axles 1 3/4 in. diameter, and extend clear across carriage, are furnished with self-oiling bearings. Front block is fitted with timber rule, placed as desired; 54 feet of V and flat track furnished with each carriage.

SET WORKS—As shown in cut, is made up of ratchet wheel 12 in. diameter, 4 in. face, with set lever carrying 7 steel pawls of varying lengths; also, same number of check pawls set in quadrant. Both sets of pawls are disengaged from either side of carriage when required to recede knees. This is a positive set, without lost motion.

FEED WORKS—As shown in cut, consists of 16 x 12 in. drum, with spur gear keyed to shaft. Pinion or friction shaft in saw frame engages with this gear. Cable takes two or three turns around drum, and is passed around end sheaves and attached to carriage. We also furnish 26 in. drum with internal gear in place of 16 in. drum when desired.

BELL LOCOMOTIVES

Concentrated Tractive Power for the Lumberman

Operated On Liquid Fuel

Bell Locomotive weighing 12 tons hauls 285 ton logging train at plant of W. C. Edwards Co., Rockland, Ontario, Canada.

CHEAPEST FUEL—Will operate on Kerosene, fuel oil, distillate or crude oils.

NO HOT ASHES OR SPARKS can fly out so that fire hazard is eliminated.

50% GREATER TRACTIVE EFFORT than direct connected type locomotive of equal weight.

ONE MAN OPERATED—One valve fire control.

STANDARDIZED DESIGN—All parts interchangeable and kept in stock for immediate delivery.

WRITE FOR CATALOGUE AND PRICES TO-DAY.

A
U
S
E**

- (1) They will dog with perfect ease and safety in any class of timber.
- (2) Will dog just as easily, frozen maple or hardwoods of any description.
- (3) Will dog the last board, just as easily as they dogged the first one.
- (4) They do not tear the board or stock.
- (5) Many other reasons, too numerous to mention here.

Write us for full particulars and booklet on same.

We also manufacture the following High-Grade Saw-Mill Machinery:—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer. P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders, Valves. Five different classes and styles of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars. Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use. Descriptive Booklet and prices mailed free upon request.

ATKINS STERLING QUALITY SAWS

**From forest to your home ATKINS
SAWS give the best results**

The Cross-cut in the woods—the Circular Saw in the Mill—the Hand Saw of the carpenter—in fact the whole host of Atkins Saws have proved that good workmen appreciate them.

Big logging camps, big lumber mills, and big building operations everywhere use Atkins Sterling Quality Saws.

Home in Kingston, Roofed with Brantford Asphalt Slates

Beauty, Fire Resistance, Economy Combined in this Roofing

The roofing that is being sold more and more throughout Canada not only for barns and small buildings, but for the most expensive homes, churches, golf clubs and public buildings, is Brantford Asphalt Slates.

Brantford Asphalt Slates are made from a special grade of long fibred felt which is exceedingly absorbent. This is thoroughly saturated and coated with Asphalt and surfaced with crushed slate, which is imbedded so firmly into the Asphalt that it cannot even be kicked off with the heel. This makes a splendid surface of beautiful reddish brown and dark green—a surface that never fades.

This grade of roofing is sold in three different forms. Brantford Asphalt Slates, Brantford Asphalt Slab Slates and Brantford Crystal Roofing.

The Slabs are really 4 slates in one and save time in roofing a large building.

Crystal Roofing is the same material as the Slates, only in roll form, and is especially adapted for barns and out-buildings requiring a permanent protective covering.

Asphalt is one of the most water-proof materials known, and Brantford Asphalt Slates being non-absorbent do not become water soaked or rot, neither do they crack nor fall off. They possess one great advantage over any other roofing made in that they cement together under the heat of the sun and form a solid, pavement-like surface on the roof, under which no rain or snow can drive, and no individual slates become loose or fall off. Highly recommended by prominent and experienced builders.

Brantford Asphalt Slates

will be used extensively in the future, and will play a big part in the great Period of Reconstruction which is just beginning.

Lumber dealers will find this a most profitable line to handle. Customers will buy it when ordering lum-

ber, and it not only develops into a profitable sideline but also brings new customers and helps increase your lumber sales. At least put in a small stock of this roofing. You'll need no urging to send a large repeat order.

Let us send you full information, prices and samples.

Yates
No. 281
Band
Rip Saw

Powerful Feedworks
of the "281"

The "Rip" With a "Rep"

Since the "281" was first built, 15 years ago, it has earned an enviable reputation as a band rip saw of exceptional durability and efficiency. The powerful feedworks, shown in section above, is but one of this machine's many strong features. It will stand up to the heaviest ripping at feeds up to 300 feet per minute.

Send today for our illustrated circular on this machine, and convince yourself as to its reputable excellence.

P. B. Yates Machine Company Ltd.

HAMILTON, ONT. CANADA

U.S.A. Plant, Beloit, Wisconsin, U.S.A.

"The Invariable Choice of the Man Who Knows"

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

Dunbar Engine & Foundry Co.

WOODSTOCK, N.B.

ONTARIO

Canada's Banner Province

Ontario's timber production last year valued at \$26,774,937 or 40% of Canada's total output.

Pine production, 905,442,000 ft. B.M.

Pulpwood, 246,282 cords.

Railway Ties, 5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.

For maps and full information regarding Ontario, apply to

Graton & Knight

Standardized Series
Leather Belting
Tanned by us for belting use

TRIPLE INSURANCE

A belt is a beast of burden that can spill a large part of its load without your eye perceiving it.

Here is a belt travelling at a speed of over a mile a minute. At more than a revolution per second, think how even little leaks would foot up a big total if this were not the proper belt for the work to be done.

All G & K Standardized Series Leather Belts give triple insurance against leaks because each is standardized in its manufacture and standardized for its work.

Write for Book, "Standardized Leather Belting."

GATES REFRACTORIES, LIMITED

382 St. James Street

MONTREAL

Manufacturing All Kinds of Special Shapes in Refractories

Remember, we are making all our own blocks and making a specialty of special shapes.

We are using a high grade fire clay, which is the factor of supreme importance in all processes of manufacture. Our burners are experts. When you are in the market be sure and write us as we know you will find our proposition interesting.

Our stoker arches are designed to promote combustion and give longer life.

Our door arches and jambs are made to withstand the

strong-armed boy with the slice bar.

Our side wall blocks are made to eliminate the many joints that clinkers stick to, when ordinary fire brick is used. They give longer life and reduce air leaks to a minimum.

We designed these arches and blocks so that any handy man could replace same in half the time that it takes to repair a standard fire brick job.

Remember, Gates' blocks means cutting your cost of up-keep and fuel bills.

High Temperature Fire Clay for Emergency Repairs.

We specialize in all kinds of POWER PLANT BRICK WORK

Call on our engineers at any time for information you may require; their services are offered to you without obligation.

"Hamilton" Steam Tension Band Mill (Single or Double Cutting)

SPECIAL FEATURES OF THIS BAND MILL

- 1—Tension on saws maintained by steam—quickest and most sensitive form of tension yet devised.
- 2—Top wheel supported both above and below mandrel.
- 3—Extra large mandrel bearings top and bottom.
- 4—Top wheel has 12-inch range of adjustment.
- 5—Unbreakable upper saw guide raised and lowered by steam—first used on our machine.
- 6—Both top and bottom wheels instantly aligned by screw adjustment.
- 7—Operating mechanism is rapid and power driven.
- 8—Takes saws 12 inches to 14 inches wide.
- 9—Extra heavy, rigid, strong and accurately built throughout.
- 10—Built by expert workmen in a plant that has been manufacturing high grade saw-mill machinery for over sixty years.

Your Drying Problems

Your individual problems of veneer drying may be different or the conditions more exacting. Because it is seldom that two drying problems are the same our engineers make a special study of your particular conditions, considering the relation of the drying to preceding and following operations, quantity to be dried, number of men employed, heat available, cost of power, etc.

CANADIAN MATHEWS GRAVITY CARRIER COMPANY, LIMITED
PORT HOPE ONTARIO

LOG DECK MACHINERY

The illustration shows our Standard Double Deck Steam Kicker. This device is made in several sizes, with cylinders ranging from 8 in. to 12 in. in diameter. We also build Pacific Coast Kickers with cylinders from 14 in. to 18 diameter. The bottom heads of the cylinders are cast solid with the cylinders—no leaky joint. The valves are fastened to cylinders on "ground joints"—no packing required.

May we send catalog?

The 1919 Model Kendall Circular Gang

A New Machine That IS New

This illustration shows the latest development of the Kendall Circular Gang.

It takes cants from 4 in. to 12 in. thickness at the rate of from 2500 to 3000 a day, will turn them into lumber, perfect in finish and cut evenly from end to end.

Big capacity on small logs, and lumber cut better than is possible on Band Saw, Circular or Vertical Gang, distinguish this machine.

It meets the demand for a machine that will turn small logs into merchantable lumber economically. Those already in use have proven their worth.

While all good points of previous models are retained, such weaknesses that use has made apparent have been eliminated. The new features and better construction of this 1919 Kendall Gang mean an appreciable increase in capacity, in nice cutting ability, and in safety, convenience and sturdiness.

This latest development of the Kendall Gang patents is built in a shop that has specialized in high class machinery construction—that has built machinery for Canadian sawmills for more than seventy-five years. Our reputation is a guarantee that this New Model Kendall Gang is built as it should be.

When you investigate the Circular Gang question see that you get facts and figures of the "WATEROUS KENDALL GANG"—the New Machine that IS New.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 39

Toronto, October 1, 1919

No. 19

The Significance of Fire Prevention Day

The Privy Council has appointed October 9 as "Fire Prevention Day," on which date the attention of the public will be specially directed to the extent of preventable losses of life and property by fire, and the best means of controlling it. The idea is that once every year the public should be forcibly reminded of the losses incurred by fire, and also instruction given as to how these can be avoided.

All sections of the lumber industry are greatly interested in this subject. The losses by the destruction of lumber yards and sash and door and other woodworking factories are enormous, and a considerable proportion of these can no doubt be eliminated if proper care be taken. We need not point out the immense destruction of timber limits—due to carelessness on the part of settlers, campers, fishermen, etc. In the St. Maurice district the railways have been the most prolific sources of fires. The Canadian Forestry Association, the St. Maurice Forest Protective Association, and other similar associations have done very valuable educational work through lectures and various forms of literature. Formerly, there was a feeling of antagonism to these efforts to lessen preventable losses, but the educational work has succeeded in convincing many of the settlers that the fires are an economic loss not only to the timber limit holders, but to the people who are dependent upon woods operations for at least a portion of their living.

Timber limit holders who neglect means to protect their forests not only endanger their own property, but those of the owners adjoining. Once a fire is started, there is no telling to what extent it will spread, unless means are at hand to check the outbreak. The Quebec Government recognized this, and last session introduced a Bill to compel holders of licenses who cut timber on Crown lands to patrol their limits, with rangers appointed by the government. If a license holder fails to employ the rangers, the Minister of Lands and Forests

has power to employ them, and charge the cost to the license holder.

Canada has a very bad record in the matter of fires, not taking into account the forest fires. In 1918 over thirty million dollars were lost, competent authorities estimating that at least 75 per cent. of this was preventable. There is thus a large field for education on this subject, and the government is doing a real service to the country in trying to impress on the people the importance of preventing the loss of human life and the necessity of the conservation of material wealth. We are every day being reminded of the imperativeness of greater production—the preservation of existing wealth is equally urgent, especially when it is remembered that the destruction by fire is mainly due to preventable causes.

The Perplexing Problem of Existence

It is rather amusing to hear "the pot call the kettle black," yet this is what lessee and lessor are doing today. With a scarcity of houses in every town, and the mad rush to rent anything in the shape of a habitation, rentals have naturally climbed rapidly. It is the old law of supply and demand, and just now the demand happens to be much larger and more insistent than the supply. Landlords have been stigmatized by tenants as being profiteers, extortioners, tyrants and everything else that these terms imply. On the other hand, landlords are rejoicing that there is very little money in leasing a dwelling, even at the present high values obtaining, as plumbing has increased more than 100 per cent., while a decorator asks from 75c to 80c an hour, and carpenters the same. Then taxes have taken a jump, while lumber, glass, paint and other things that go to keep a place in habitable condition have ascended so quickly that one is not aware of the sharp advance until rudely up against it. Real estate agents declare that there has been little profiteering among the landlords, and that the leased house is no gold-mine nowadays.

This brings up the whole question of the trend of people in general. Immediately after the outbreak of the war, when a panic seemed to seize the business world, industries restricted operations, and many residents went to the front, there was a decided drop in rents in every large city. It was then that many possessors of homes thought they were making a mistake in carrying a house as it was much cheaper to live in a dwelling owned by someone else, pay a moderate rent and get rid of all the exactions entailed by a steadily ascending tax rate, local improvement levies and increased assessment.

Now the pendulum has swung the other way, and owing to the abnormal advances in rents, persons are rushing around in all directions to purchase houses, which, due to the heavy outlay of materials and labor, are commanding a greater figure than ever before. The whole question has been discussed in the press, and no satisfactory answer has been arrived at regarding the necessity of some restrictive legislation in the matter of rents. The solution of the problem to lease or to buy at the present time is perplexing, and as affording some light on the situation, one real estate agent said recently: "Let any man build a solid brick, eight roomed house today and attempt to rent it at \$30 per month and he would not make 2 per cent. net profit on his investment." In years gone by 10 per cent. has been accounted a moderate return for house owners on their investment in property, but it is doubtful, even with rentals almost double to what they were, whether with the net income, when repairs, cost of materials, wages, etc., are taken into consideration, there is any short route to wealth in erecting and maintaining the ordinary six and eight roomed dwellings for tenants.

Landmarks in the Lumber Industry

We are becoming a nation with a past, and many of the institutions of the present are being linked up with historic interest. We speak of the Dominion as a young country—one with a great future before it—and seem to forget that our present status has been brought about through the heroic efforts and sturdy independence, splendid endurance and sustained self-denial of those who have gone

before. Few of these pioneers are alive today to tell the tale of what they have accomplished, and leave only their records. Others are able, by means of the spoken word, to join in significant events which have been commemorated during the past few weeks.

Price Bros. & Company, of Quebec, have just celebrated the centennial of their existence, and the present head of this aggressive concern, Sir William Price, is a grandson of the doughty founder. At Rockland the other day the 50th anniversary of the building of the first sawmill in that progressive town was observed with enthusiasm and grateful appreciation of Hon. W. C. Edwards, of Ottawa, originator of the busy industries bearing his name. Mr. Edwards was present, and, after the long lapse of years since the inception of the mill, is in excellent health. He had the pleasure of being surrounded with a number of those who were co-laborers in early days in laying the foundation and erecting the timbers. The remarks made by the Senator on that occasion in reviewing his life history should prove an incentive to every worker of the present period.

Another lumberman who is still very much in the thick of the fray and has been a resident of the capital city of Ottawa for 62 years, where from a small shingle mill he has reared the vast enterprises that cover scores of acres at the Chaudiere, is the venerable J. R. Booth. Mr. Booth is never quite so happy as when supervising some construction work or going through the various departments of his great industries, seeing that everything is moving along with the utmost precision and maximum production of which modern machinery is capable.

Thus the lumber industry has attained an important and far-reaching development in Canada, and some of those associated with it over half a century ago, are still prominent figures in the business life of the day. All honor to them for the worth and work they have exemplified in careers that are outstanding, unique and inspiring in purpose and achievement.

Will Pulp Solve High Living Costs?

Sir George Bury is becoming equally as enthusiastic a pulp and paper man as he was a few months ago in railway affairs and administration. The former C. P. R. magnate is now president and executive head of the Whalen Pulp & Paper Mills, Vancouver, and foresees a great future for this industry. In fact, so optimistic is he that he believes pulp and its products will finally solve the high cost of living, and everybody hopes if this is the final solution of this perplexing problem that it may come speedily. The householder, the wage-earner, the buyer of wearing apparel and many other classes of citizens, will read with interest and satisfaction an interview which was recently had with Sir George. The only ones who will be alarmed by his prophetic utterance are the laundry proprietors and crockery manufacturers.

Here is the statement, and it shows that Sir George is not only a great booster for Canadian pulp, but also for the province of British Columbia:—"The pulp industry is in its infancy. It is in the same position as steel was twenty-five years ago. Paper made from pulp has been employed to make wheels on Pullman cars. In a few years everything we wear will be made of pulp. Five years from now the housekeeper will have all her kitchen utensils made of pulp. The laundry will largely disappear, because our underclothes, shirts, collars, tablecloths, napkins, etc., will be made from pulp.

British Columbia will produce the pulp for the world, because nowhere else in the world is there grown better wood than the Sitka spruce, found on the British Columbia Coast. Sitka spruce has the longest and strongest fibre of any wood, and was used exclusively in the manufacture of airplanes. It makes the strongest and whitest pulp, as strong as the pulp made by the Egyptians from linen in the form of papyrus. Nowhere in the world is there such a generous supply of pure water. One hundred thousand gallons is needed to make a ton of pulp. I believe that pulp will finally solve the high cost of living."

Editorial Short Lengths

The average wage of the United States railway employee now is \$40 a week, or \$2,000 a year. This is an increase of 100 per cent. Canadian railwaymen get about the same rate. The railways used to pay under rather than over the average commercial scale, but government operation has changed all that.

The late Hon. Peter Mitchell, a former Canadian politician, who used to style himself "the third party," had a favorite epigram to the effect that the best argument in the world is a bank account. Most sufferers from the high cost of living at the present day will agree that there is both point and wisdom in his observation.

Lumber and forest products form important items in our export trade. The figures for August show that they were in that month the third on the list, ranking after animal products, with agricultural products in the first place. The total value was \$20,982,228, against \$14,790,014 in the corresponding month in 1918. The figures for July were about \$2,000,000 better than for the same month in 1918.

The Montreal Board of Trade has decided to protest against the Bill providing that water carriers be placed under the control of the Railway Commissioner with regard to tolls and tariffs. It is contended that the jurisdiction which it would give the Board of Railway Commissioners over tolls and tariffs on freight traffic carried by water between ports in Canada, would tend to limit competition between the water carriers themselves, which in turn would tend to decrease the competition between water carriers and the railways, a condition which would almost inevitably result in increased freight rates.

In reviewing conditions in the paper trade at the annual meeting of the association of wholesale dealers in that line, held lately in Montreal, President John F. Ellis, of Toronto, made some pointed observations in regard to the present position and future of Canada, which, he asserted, was in many ways tied up with the paper business. Mr. Ellis stated that the public debt of the Dominion is \$1,800,000,000, an amount equal to the gross deposits of all the chartered banks in the land, as compared with \$350,000,000 before the war. The reduction of this debt is a question in which every business man, individually, and every trade, collectively, is vitally interested. To pay this debt we must export more and import less. Not only must we seek to supply our own needs, but we must sell more and more of our products to the other nations of the world. The question of export trade is one which more closely affects the mill than it does the merchant, but in that of imports we have a lively interest. It is to the great credit of this young country that to-day our Canadian mills are manufacturing paper which is the equal of any in the world. There is no truer method of showing our Canadian patriotism, there is nothing we can do to help the industry in which we are so concerned, and the country which we so dearly love than to sell to our customers paper made in Canada by Canadian workmen.

It is gratifying to note in passing that imports of paper into Canada have been showing a steady decline, while exports have shown just as satisfactory an increase. During our last fiscal year, for instance, we exported approximately \$100,000,000 worth of pulp, paper and pulp wood—truly a gigantic total, and a banner year for the industry. While the record for the past three months does not indicate that this figure will be reached this year, owing to the close of the war having created new conditions with our best customer, the United States, there is every reason to believe that Canada will continue in the front rank of the world's suppliers of pulp and paper. Dominion legislation prohibiting the export of pulp wood would go a long way toward still further enhancing this total in dollars. If our parliament could reach the conclusion that this country, which is blessed by nature with such a limitless store of raw material for paper, would export this material only in the form of the finished article a new chapter would be written in the history of the paper industry in Canada.

Britain Much Interested in Ontario Woods

Mr. Manbert Gives Vivid Impressions of General Conditions and Market Situation in Old Country—Recuperative Processes Not as Rapid as Expected

A. C. Manbert, Toronto, Ont.

After six months spent in Great Britain and on the Continent, Mr. A. C. Manbert, of Toronto, who has been doing effective propaganda work in England in the interest of Ontario forest products, has returned home and resumed his former duties as president of the Canadian General Lumber Co. Mr. Manbert was accorded a splendid reception in the Old Country and found all classes of people greatly interested in the Dominion while everywhere Canadians are enthusiastically received and the heroic part they played in the European conflict written large on the page of memory and gratitude.

Touching upon conditions in the Mother Country Mr. Manbert, in conversation with the "Canada Lumberman," said: "The situation has been much more in-

volved, and the process of turning over from the long concentration upon war business to peace times has been a much more difficult process than most men have imagined, and certainly more difficult than we all had hoped. The genesis of the matter is psychological, because you have to get out of the one mental attitude which developed great tensions and great concentrations, into an entirely different one; all of which is joined in an escape from a situation which was built upon conditions, so to speak, of Governmental direction and urge, and which now, in the liberation of the control of all men's minds and activities, finds in this readjustment great difficulty in accomplishing the new meshings of the cogs of the machinery.

"In concrete facts, it turns upon the attitudes of labor, the resulting costs of materials and the financial considerations which are embodied in exchange. Transportation also has played its tremendous, and for the time being its controlling part, because we were unable to take over to the people, as fast as they wanted it, the materials that they wanted, and now that transportation has somewhat improved, situations of port congestion and general unpreparedness of labor and facilities to carry the materials to their ultimate places of consumption are creating great disarrangements and difficulties and blockades.

Cordial Attitude and Friendly Interest.

"The attitude of the British public is, as I have previously stated in my letters, most cordially directed towards this continent as a source of supply, so that from the standpoint of friendly interest the trade instinct naturally runs this way. The two controlling reasons which made me feel that it was desirable for me to return at this time were, that the general resumptive processes over there being so much slower and more difficult than we had hoped and desired, there was, from that point of view, less reason for me to remain, because the thing must work itself out in the development of time; and, on the other hand, the very marked change in conditions at home has undoubtedly tempered the acute interest which we had when I left here, in that market; so that, for the time being at least, we had lost the keen desire which we had for the European business. Whatever may be our ultimate purposes and expectations, for the immediate moment we are so overwhelmed and concerned with the business which lies directly at hand here that I did not feel that we had either the material or the inclination to pursue the business with the ardor which was contemplated when I went over there."

The General Situation Summed Up.

Mr. Manbert's views in regard to the general situation in England are more completely outlined in a letter which he wrote before leaving the Old Country. This letter, which was directed to the Minister of Lands, Forests and Mines and to the Chairman and

Secretary of the Organization of Lumber Manufacturers who cooperated to send him on the mission, is, in part, as follows:

It is hard for us in Ontario to realize the degree to which some businesses have been suspended during the war, by reason both of absorption of their entire staff in war work, and also in some cases by the practical cessation of all opportunity for business. This necessitates the establishment of new relationships and has brought to me a number of people who are practically starting anew, and are anxious to learn about Ontario's sources of supply in timber and timber products.

Interviews of my soliciting have been intended to embrace every angle that is of particular interest, and have included Government and Shipping Officials, men of affairs who would be informed on British policies, agents and distributors in the timber trade, and merchants and manufacturers in whose business, timber figures either prominently or incidentally.

All of this has meant considerable travelling and I have covered England and Scotland quite thoroughly. In every case, have I received that courteous and enquiring consideration which has from the first marked the attitude of the people here, and which I feel that I can never quite adequately acknowledge.

I was, it is true, pleased to feel that, in some cases at least, my observations if not new, had an interest in coming from a fresh quarter, from the producer rather than the merchant. But always, and beyond this, I was made conscious of the magic potency of the name Canada. It was ever the "open sesame" that unlocked reserve and accredited my introduction. This sympathetic favour really amounts to a practical obsession "Canada has the preference" is the statement in variable forms which I continually hear.

Dissatisfaction Over White Pine Distribution.

When I wrote you last, I remarked that the local demand was generally good, and for White Pine, very keen. This condition still persists, and I don't think it can be said as yet that the edge has been taken off the consumers' appetite. Indeed, in respect to White Pine, the method which the Timber Controller is taking of rationing his incoming stock, with selling prices stipulated, to certain distributors who have heretofore figured largely in the distribution of White Pine, has led to a good deal of dissatisfaction and criticism. Complaint has been bitterly made that the favoured ones have received an undue share of this much desired wood, to the serious disadvantage of others. So keen is the demand, it is probably true that but for the arrangement by the Controller, prices would have advanced considerably in excess of those named by him, and as it is, there are numerous charges of profiteering.

I can imagine it difficult to discuss food values or food discriminations with a hungry man. He wants any food rather than some particular variety. Perhaps, in this figure, you will understand my feeling that at the moment in the matter of Pine lumber, people are interested in getting any kind of Pine rather than some particular kind. And so, while they discuss earnestly questions of the future supply, it is the difficulties which lie in the way of resumption of business that so absorbingly engross them. In saying this, you will quite misunderstand my intention, if I seem to suggest that the discussions have had a limited scope. On the contrary, they have embraced a wide range of enquiry concerning both our immediate operating conditions and potential capacity for the future. The belief is general that the scene is laid for a great demand, but the immediate acute shortage overshadows this in present interest.

In this matter of future business, I may here remark that when once time and untensioned restrictions give it free play to develop, I am satisfied it will have a broader range, both as to inquiry and personnel. The quickened interest of now engaged parties as well as the instinct of the less well established or unestablished, for new relationships guarantee this. Not all of these last named bear the hallmark of competence and promise, but their influence in stimulating salesmanship and practices is not to be overlooked.

Not Much Done Yet in Housing Line.

The housing programme I have followed with considerable interest. The complexities are many and I regret to report that progress is slow. While the Government has given some orders for bricks and doors in anticipation of their use, to satisfy the clamour

of unemployed facilities, practically no real construction has begun, and it looks doubtful if very much will be accomplished this year.

The local factories are here again crying loudly against the importation of any manufactured articles, to appease which the Government has had to announce that all joinery will be of home manufacture. It is, however, pretty generally conceded that local facilities are quite inadequate to any extended consumption, and I am certain that a large market will exist for doors and sash when once building assumes substantial proportions. This is a matter that our Ontario factories should take cognisance of, and by keeping in touch with the situation prepare themselves to step in when the opportune moment arrives.

In respect to the use of Pine for doors and joinery work, while its superiority as a wood is well recognized here, I regret that familiarity with the Baltic Whitewood and Redwood has led people to be satisfied with the poorer qualities of these woods for this use, so that Pine does not enjoy the favour and vogue which is the case with us at home. On account of this, some of the specifications which have already been drawn for joinery work quite ignored our Canadian woods, and only specified Redwood and Whitewood from Scandinavia. I have promptly made this an occasion for protest, and am happy to say that these specifications have been changed so that our woods rank equally in the prescriptions.

The Smaller Lines of Wood Goods

Turned Goods, Small Wares and Miscellaneous Wood Manufacture.—In the past Britain has imported a vast amount of turned goods of all kinds, such as dowels, handles, pins, and so forth; likewise, various manufactures such as step-ladders, benches, drawing boards, and a host of articles of this sort. There are a number of concerns throughout the Kingdom who devote themselves largely to this class of business, and I have received many enquiries from parties who are anxious to get in touch with Canadian sources of supplies. Formerly, a considerable part of this business went to the States, but here again the import restrictions interfere, and quite apart from sympathetic considerations, Canada enjoys an unusual preference at this particular moment. One party, since calling on me has left for Canada and will visit the people to whom I have referred him. Others have expressed the same interest, and I have no doubt will follow the matter up exhaustively if they receive any reasonable inducement. It will, therefore, give me much satisfaction to lay this matter before our people who may be interested.

In all the foregoing I have attempted as briefly as possible, to summarize the subjects which I have followed up. There are others, but these are the chief ones. Some of the subjects are, of course, only indirectly of interest to our lumbermen, but they are directly of interest to the Province. Anything which came under the head of "Forest Products" has therefore received my careful attention.

Difficulties in Business Rehabilitation.

The interviews which I have had have been most interesting in throwing light upon the tremendous problems and difficulties that lie in the way of resumption and rehabilitation of business. I wish it were possible for me to give you some of the details of these various interviews, because it would bring to you more vividly the local atmosphere, and quite apart from information and intellectual interest, would help you to understand and appreciate perhaps more than you do, the distinct advantage which we, in our freer and less restrained situation, enjoy in the recovery of our normal and natural business life.

Shipping.—You are quite aware that this problem has not improved, as was hoped, and that the rates, instead of decreasing, have increased since I last wrote. As if this situation were not bad enough, port congestion is now becoming serious, and this again is going to affect both freights and quantities of imports, because the physical difficulty of handling the goods in the ports cuts both ways.

What, with labor difficulties, adverse exchange, and food and coal shortage, it is evident that the people of this country have got to put up with many inconveniences and disappointments for some time yet. To me, it becomes increasingly apparent that the signing of peace is only an incident and not an epoch in ending the effects of war, and that resumptions and recoveries here will unfortunately be much slower than we have so ardently desired. This is not to say that progress is not being made, nor that ultimately a tremendous business is not to result, because when once these many wrinkles in production are ironed out and processes attain their normal facility, the satisfying of the many deferred desires and needs is bound to create an activity that will probably last for several years.

In this, without attempting to prophesy, unavoidable changes in methods and relationships will work themselves out gradually

with the readjustment, and with it all, to the extent that we are prepared to enter, we may share in this great business.

A Position of Favor and Promise

This brings me to the point which has given me much concern. If I have at all succeeded in making things appear to you as they do to me, you will agree that for the future we have a position of favors and promise in this market, but that at the immediate moment we have reached a sort of "impasse." The Timber Controller will not be successful in getting all his purchasers brought forward this season, and until controlled stocks are forwarded and distributed, new purchases and any real outlook of interest of private purchasers must be very limited. Any hopes that we had for new and unusual purchases by either private parties or the Government for the Housing programme have been resigned. In a word, recuperative processes, as I have already stated, are much slower than we commonly imagined they would be. The country is gropingly trying to "find itself." In a sense it is "marking time," and we must mark time with it.

All of this effectually, and for an indefinite period, limits my efforts in a way which I cannot complacently accept. Propaganda work of itself is only important when it leads to definitely productive results. My time is too valuable to spend on it alone. Besides, as an effort it cannot endure without something to keep it vitalized—concrete results to give it life.

Conditions are also very different at home from what they were when I left. Recent advices from Ontario, Eastern Canada and the States indicate that for this year, at least, the market on the American Continent will qualify, for the time, the very acute interest we had in the export field, when I came over.

Upon my return I shall be prepared to report in detail upon all of the subjects upon which I have touched. I hope that the investigations I have made and the information acquired can be used to advantage to increase the trade with this great country, and to further the friendly interest in Canada which I have everywhere here found so abounding.

Lumbermen Gather at Festive Board

Stirring Addresses Delivered by Hon. Mr. Ferguson, Mr. Manbert and Others on Export Trade Prospects

Representative lumbermen from various parts of Ontario assembled around the festive board at the King Edward hotel, Toronto, on Sept. 24th to listen to a most instructive, interesting and comprehensive address from A. C. Manbert, of Toronto, who recently returned from the Old Country where he spent several months as Ontario Timber Commissioner. Mr. Manbert who was engaged in propaganda work in the interest of forest products of the province, was cordially welcomed home by his confreres and was heard to splendid advantage in his remarks which, while covering to some extent matters that have already been outlined in able letters from his pen to the "Canada Lumberman" presented several new phases of the present situation with respect to industry, enterprise, reconstruction and national spirit and ideals as reflected in the British people.

After a full measure of justice had been done to the many attractive items on the bill-of-fare a toast to "The King" was honored.

W. E. Bigwood, chairman of the committee of the Ontario lumber manufacturers, who had the arrangements in hand, briefly but touchingly referred to the death of Hon. Frank Cochrane, former Minister of Lands and Forests for the province of Ontario. "He was one of the big men in Canadian public life," declared the speaker, "a man of sterling qualities of character, who was loyal to the public interests and to his friends. The late Mr. Cochrane was always interested in the welfare and progress of the lumbermen and I would ask that you honor his memory by a silent toast." The members complied with the request of the chairman.

Mr. Manbert was then called upon by the chairman who stated that, when it was decided to send Mr. Manbert overseas in the interests of the timber trade of the province, it was understood that he was to stay away for a year or return in less time, if he deemed it advisable. He had come back at the end of six months "and he is here," added Mr. Bigwood, "to tell us why he is back and what he found out over there."

Mr. Manbert was given a most cordial reception as he rose to reply and spoke most interestingly of the work which he had carried out, a general outline of which is given in the interview with him on the preceding pages. He amplified this in not a few instances and dealt with some new phases of the problems, both present and prospective, which Canada and the Mother country would in the course of post-war development be called upon to solve. A more complete

reference to these is held over until the next issue of the "Canada Lumberman."

At the close of Mr. Manbert's address, Walter M. Ross, Ottawa, proposed a hearty vote of thanks. He referred to the sacrifice that Mr. Manbert had made in giving up his extensive business connections to go abroad and carry on the splendid work which he had done. They all appreciated his industry and activity on behalf of the forest products of Ontario. He felt sure that, in selecting Mr. Manbert for this important work, the lumbermen had made no mistake, as a better representative could not possibly have been appointed. The resolution was carried amid applause.

Mr. Ferguson Announces Future Plans

Hon. G. Howard Ferguson, Minister of Lands, Forests and Mines, was next called upon by Mr. Bigwood who paid a warm tribute to the minister for his interest and activity in taking the initiative steps which lead to the sending of a representative of the lumbermen overseas. The speaker added that Mr. Ferguson had done everything possible to facilitate the work and to assist in making more widely known the merits of the forest products of the province.

In a short, stirring address Mr. Ferguson replied and expressed his pleasure listening to the interesting and vivid presentation by Mr. Manbert of conditions which had to be met in England at the present time. He was pleased with the selection made by the lumbermen when Mr. Manbert was appointed to go overseas and in him both the province and the lumbermen interested had found a most efficient and aggressive representative to carry on a propaganda campaign. Mr. Ferguson said he had received reports from many outside sources regarding what Mr. Manbert had done in the Old Country and it was a source of gratification to find that commendation of his work conducted over there came from all quarters. Mr. Manbert had put before the people of the Old Land the possibilities, qualities and manufacturing facilities of Ontario timber and he was sure that the province would benefit in the opportunities that would follow in the days to come. The Minister pointed out that he was revealing no secret when he announced that it was the intention of the Ontario Government to have qualified representatives in London, Eng., in practically every leading industry of the province and the move made in connection with the lumber industry was one of the first in the initiation of such practical work.

Ontario was the banner province of Canada and provided one-half of the lumber, as well as of all raw materials that was produced in the whole Dominion, and in the sending of men overseas to take part in the struggle for freedom and liberty her representation had also been equally as large. Mr. Manbert had referred to the unsatisfactory character of the office accommodation and equipment which the province had in London, but it was the intention of the provincial administration to provide in the near future more adequate and appropriate quarters that would be in keeping with the dignity, importance and business of the country. Every leading industry would be represented by a thoroughly qualified man who would have a full range of samples and be in a position to give the fullest information and advice. Mr. Ferguson said if he might use the term "expert" it would perhaps convey his meaning more clearly than any other. These men would represent every phase of the agricultural,

industrial and productive life of Ontario and he felt sure that Ontario would thus get a fair share of the world's opportunities.

The mission of Mr. Manbert had amply justified itself and the Ontario Government was abundantly satisfied with the work that he had done. As Lumber Commissioner for Ontario Mr. Manbert had not gone overseas to sell forest products but to carry on an intelligent propaganda and secure intimate, first hand knowledge of market requirements in Great Britain during the period of readjustment and to convey authoritative information regarding what Ontario could supply, and how the producers here could best cater to the wants of the Old Land by adopting methods that were feasible and calculated to meet existing conditions. He believed the work done would command itself to the province and hoped that it had not been completed, but that at a later date Mr. Manbert might be able to return overseas and finish the task so ably and well begun.

In closing Mr. Ferguson stated that, personally, he was much interested in the conservation and reproduction of Ontario woods

Closing Remarks on the Work Done

Short addresses were also delivered by W. W. Humphreys, of Ottawa; W. J. Bell, of Sudbury; E. A. Dunlop, M.L.A. of Pembroke; Hon. Geo. Gordon of North Bay and Geo. H. Holt of Chicago. The latter read an original and catchy poem entitled "Well Done Manbert," which aroused much merriment. Hon. Mr. Gordon in his remarks stated that, owing to the rather poor health in which he had been during the past summer, he had not followed as closely as he would have liked the work which had been done, but after hearing the splendid address delivered by the Ontario Timber Commissioner, he was confident that his task had been performed in a manner satisfactory to the whole industry and that those with whom Mr. Manbert came in contact had only the best to say of him and his work. Mr. Gordon also commended Hon. Mr. Ferguson for his energy and foresight in arousing lumbermen of Ontario to take advantage of the overseas call for constructional material and for his co-operation in the matter of sending a commissioner to represent them so efficiently as Mr. Manbert had done.

Among the representatives of lumber manufacturing firms present were W. E. Bigwood (Graves, Bigwood & Co.) Byng Inlet, who presided; A. C. Manbert (Canadian General Lumber Co.) Toronto; W. M. Ross, (J. R. Booth), Ottawa; Hon. Geo. Gordon, (Geo. Gordon & Co.), Cache Bay; A. J. Young, (Young Lumber Co.), North Bay; W. J. Bell, (Spanish River Lumber Co.), Sudbury; F. N. Waldie, (Victoria Harbor Lumber Co.), Toronto; E. A. Dunlop, M.P.P., (Pembroke Lumber Co.), Pembroke; D. A. Gillies (Gillies Bros.), Braeside; J. J. McFadden, (McFadden & Mulloy), Spragge; C. N. Carney, (Hope Lumber Co.), Thessalon; W. W. Humphreys, (W. C. Edwards & Co.), Ottawa; A. B. Gordon, (Tomiko Lumber Co.), Calender; D. C. Johnston, (Marshay Lumber Co.), Toronto; J. W. Slater (Hocken Lumber Co.), Toronto; A. E. Gordon, (Terry & Gordon), Toronto; J. McN. Austin, (Austin & Nicholson), Chappleau; H. G. McDermid, (Marshay Lumber Co.), Toronto; H. Shanacy, (Pratt & Shanacy), Midland; Henry I. George, (Graves, Bigwood & Co.), Buffalo; Geo. H. Holt (Holt Timber Co.), Chicago; Horace Boulton, (Sec'y Wholesale Lumber Dealers' Assoc. Inc.), Toronto; G. B. VanBlaricom (Canada Lumberman).

W. E. Bigwood, Toronto
Chairman of Ontario Lumber Manufacturers' Committee

Hon. G. Howard Ferguson
Minister of Lands, Forests and Mines for the Province of Ontario

Walter M. Ross, Ottawa
Secretary of Ontario Lumber Manufacturers' Committee

Mr. Manbert Says Farewell to British Friends

A. C. Manbert, of Toronto, Timber Commissioner for Ontario, in a letter to the trade press in England previous to his departure, says "farewell" and expresses his hearty appreciation of the many courtesies and kindness extended to him during his sojourn in the Old Country. In part he writes:

"While it has been delightful to receive these considerations personally, I have been pleased to understand that they arose out of a very genuine interest in the closer relationship with Canada which has been so quickened by the peculiar contact of the past five years.

"I would be very dull not to realise that the degree to which we may enter into the trade of this country really rests upon your grace. For while we must meet the demands of competition, in the last analysis the use of our goods is subject to your election. To possess your sympathetic interest gives then, to us, a great assurance. On the other hand, it is obvious that we must merit and inspire your enthusiasm, and it has been my keen purpose to study and attempt to understand your needs and convictions that I may interpret them to our people at home.

"I am sure all will agree as to the desirability of maintaining the interest of Canadian producers in the British market. To the extent that it exists, it will temper and qualify the attitudes of the producers in competing sources of supply. A considerable factor in accomplishing this is an alert understanding on your part of the conditions which affect

our methods and administration, that is, the conflicting consideration of other markets, the characteristics of our timber, and the operating conditions which control the lengths, widths, and styles of manufacture. In doing this, and giving consideration to what we want to sell as well as what we want to buy, you will be obtaining access to larger reservoir of supply, with all the advantages which that implies.

"In Ontario we manufacture many sizes and kinds which you have not been importing. They are used elsewhere to advantage. Why not here?

"Operating conditions with us are of necessity changing. To produce the large quota of deals is no longer possible. With the very greatly increased cost of conversion here, perhaps other sizes can be used to advantage and profit. This is especially for agents and importers to consider—a matter of alert salesmanship. I hope I will not be misunderstood when I suggest that a sincere attempt to give effect to the idea will help to escape the restraints and limitations of old conventions, and invest the situation with more of freshness and adventure and less of the prosaic.

"We in Canada ardently desire, as do you, a return of full and free private trading. At the moment, conditions are not favourable to this, but ultimately the time will arrive. We, therefore, earnestly look forward for it to bring you into our midst with enlarged inquiry—for your good and for ours."

Nearly Million Ties Cut in Port Arthur District

J. A. Oliver, of Port Arthur, Ont., Crown Timber Agent, reports that during the season just closed a total of 989,865 ties were cut. Of this number 680,712 were cut on Crown lands and 299,153 were cut on private property.

Of pulpwood the cut amounted to 100,506 cords, of which 14,644 cords were taken from Crown lands, and 85,902 cords from private property.

From private property 1,068 cedar poles were cut during the season, and 10,387 cedar posts were cut from the same class of property.

Piles cut on Crown lands amounted to 1,762, and on private property 6,187, a total of 7,959.

Logs numbering 36,605, mostly of pine and measuring 1,599,168 feet board measure, were also cut.

Many Accidents in Western Lumber Industry

Statistics compiled by the Workmen's Compensation Board in British Columbia for the first half of the present year show that the lumber industry ranks, from a total wage basis, is the most important in the province, and at the same time from an accident standpoint, is the most hazardous. No less than 1,407 compensable accidents were filed during this period in the various branches of the manufacture of lumber. In addition to that number, there are also a considerable number of claims where the workmen are being paid on a monthly basis. These are not enumerated in the 1,407. The total cost to the industry of those claims finalised for the first six months period of this year is \$185,601.47.

A glance at the statistics reveals some interesting facts in connection with the cost of accidents to this industry. Injured workmen receive under the act, fifty-five per cent. of their loss of wages through accident. For time lost alone \$95,901.01 was paid to the workmen during the first six months of 1919. The average duration of incapacity due to accident was eighteen days. Of the total 1,407 cases reported, 980 of the workmen were sufficiently recovered to return to work within a month of the accident. Two hundred and fifty-two more recovered before the end of the second month, while 162 took a longer period.

For permanent partial disability, including awards for loss of limb and permanent injury not resulting in death, the sum of \$47,687.36 was paid. Injuries to fingers and hands were the most common forms of accident coming under this heading. There were 304 accidents which resulted in loss or disuse of fingers, injuries to the hand, other than fingers numbered 103. The arm figured in 66 cases. The foot and ankle came in for 171 of the accidents, and the leg and

knee for 204 more. Another very common accident was the breaking and injuring of ribs, 77 accidents to ribs being reported.

There has been a total number of fatal accidents of 39, or 47 per cent. of the total number of all fatal accidents in all industries in the province for the first six months of the year. This is most unfortunate. Some of these accidents could have been avoided, and it is hoped by the board that the employers will continue most actively the accident prevention campaign already started, and which has undoubtedly achieved great results in the last year and a half.

Well Done, Manbert!

By George H. Holt, Chicago

Who turned his back on New World charms
And dared the Ocean's hidden harms
To bear our tender in his arms?

'Twas Manbert.

Who loaded up with Lumber lore
And price temptations by the score
To plant them on a Foreign Shore?

'Twas Manbert.

Who challenged Norsk and Svensk and Finn
To help "Our Canada" to win
The markets they had gathered in?

'Twas Manbert.

Who juggled "Dollars," "Grades" and "Feet".
Till even Scotchmen on the street
Would sing the chorus, and repeat?

'Twas Manbert.

Who followed back the Frenchmen's trails
To lead the way to Lumber Sales
Through Calais, Paris and Marseilles?

'Twas Manbert.

Who faltered not at Trade entrenched,
Who prejudice with goodwill quenched,
Who ignorance with knowledge drenched.

'Twas Manbert.

To build the World the Allies won,
To cure the habit of the Hun,
This is the work so well begun

By Manbert.

"To beard the lion in his den,
The Douglass in his hall,"
To court the 'Tiger' in his Fen,
Nor hesitate at all,
Might quail the heart of other men
But Manbert
Did them all

National Retailers in Forward Movement

Great Gathering in Detroit Demonstrates Practical Benefits of Intelligent Co-operation and Adopts Progressive Measures for Better Business

The third annual meeting of the National Retail Lumber Dealers' Association of the United States, which was held at Detroit, Mich., on September 11th and 12th, marked an important epoch in the life of the Association. It can be confidently predicted that, as a result of this meeting and of the three years of serious and effective work which the Association has carried on, the National Retailers' Association is now firmly set upon its feet and its path of usefulness is clearly seen ahead.

There was a large attendance at the meeting, representing dealers from all parts of the United States. The interest taken in the discussion of the numerous important matters dealt with was indicative of definite purpose and determination to make the influence of the Association felt.

Broadly speaking, the meeting was divided into three elements. There was first of all a fine list of addresses. Secondly, there was keen discussion of many important association problems and, in the third place, there was a series of entertainment features which will make all the visitors hope that future meetings will also be held at Detroit.

Manufacturers Not to Blame for High Prices.

The addresses, which were comparatively few in number, were all on timely subjects. They commenced with the address of the president, Mr. J. J. Comerford, of Detroit. Mr. Comerford dealt with some of the retailers' problems in connection with which they could get best results through co-operation between retailers, wholesalers and manufacturers. Speaking of the present prices of lumber, he did not place the blame for their height upon the manufacturer, but upon some of the provisions of the Federal Income Tax which discourage production by the manufacturers. The manufacturer was not to blame for asking present prices, when more lumber was demanded by the consumer than the mills were able to turn out. Minimum service and maximum pay were now being given and demanded by labor, so that the producers were not able to meet the demands of the market. He wanted to see the laborer get good wages, but could not believe that shorter hours would be for the public good as they would result in reduced output and smaller earnings on the part of the workers.

Proper cost accounting methods were emphasized by Mr. Comerford as essential to modern retail lumber selling. Only through the adoption of scientific cost accounting could the retail lumber trade be made attractive enough to secure the services of young men of brains and executive ability. He also urged that manufacturers and retailers should co-operate in seeking to solve the problems of the employer and the employees. In conclusion, he suggested that the Association should hold a lumber conference every six months.

General L. C. Boyle, of Kansas City, Mo., attorney for the Association, delivered one of his invariably inspiring addresses, the subject being "The Past and Future of Lumber Dealers Associating Nationally." The retail lumber business, he said, could only be built up through intelligent co-operation between the dealers, consisting of the "elbow touch," and a courage born of mutual understanding. "There was a time," he said, "when you thought your business was your own affair, but to-day it is everybody's affair, and rightly so, because of the welfare of the whole community is linked up with what you do. You must let the public know and by so doing it will help instead of harm you."

Co-operation Urged in All Branches

A. L. Osborn, of Oshkosh, Wis., delivered an address upon "Closer Co-ordination of All Branches of the Lumber Industry." The key note of his address was contained in the following paragraph:

"Some of the great leaders in our industry have lately come to see that movements for keeping the public informed, for creating favorable sentiment and for securing fair legislative treatment can be best secured by the three branches uniting in a common way to furnish information and material for our common fight. If every retail dealer in the United States will become a militant knight in

our fight to educate the public and to secure fair legislative treatment, our fight can easily be won. The exchange of information, the manufacturers taking the retailer and wholesaler into his confidence, and the joint assumption of responsibilities, mark a new and better era. Only a beginning has been had. No field for co-operation is so large or important as this. When we have no secrets from one another and when representatives of all branches can sit in and listen to all discussions and know of all plans to better our industry, we will have taken the one biggest and most important step forward.

S. A. Linnekin, Commodity Expert of Babson's Statistical Organization, of Wellesley Hills, Mass., gave a fine review and forecast of business conditions, in which he explained the present trade and industrial situation. "As for commodity prices," he said, "the chances are that they are not far from the peak to-day. As with business, it is impossible, until commodities have been fully reapportioned among the consuming countries of the world, to expect any serious slump, at least, with any degree of permanency. These commodities, however, are fast being replenished in the hands of consumers and inside of six or eight months it seems reasonable to expect the beginning of the decline for the long pull downward. In some cases there may be further advances; but, in general, the safest buying policy seems to be to buy small lots frequently. With little to gain in the way of speculative profit the greatest stress should be placed on deliveries, which during the fall and winter may be a serious factor. We may not be so fortunate as to have a second successive open winter."

Regarding lumber, the speaker said that lower prices would be governed largely by the time that was required to put on the market lumber that cost less than it does to-day. It was not reasonable to expect any runaway advances from present levels. On the other hand, it was equally unreasonable to expect any immediate slump. In all probability, the conditions were such that a high average price would prevail well into next year. The general aspect would be firm.

A. C. Klumph, of Cleveland, Ohio, delivered an address, entitled: "Why the Retail Lumber Business"; during which he advocated strongly the more general support of lumber associations.

New Schedule of Fees Effective.

The business end of the meeting included consideration of several important matters. A new schedule of fees was adopted ranging from \$10.00 for members doing a business of \$50,000 a year or less, up to \$250.00 for members with an annual business of \$900,000 or over.

A strong report against the abuse of the transit car privilege was presented by a special committee and adopted, but not without spirited discussion and some opposition. A number of important resolutions were presented by a special committee for the purpose and were adopted. One of these instructed the secretary to secure copies of all State Lien Laws and city building codes and ordinances affecting the lumber business, to serve as a foundation for association work in the direction of securing a uniform standard of laws covering these subjects. Another resolution provided for the creation of an inter-insurance exchange in connection with the work of the Association.

Canadians Present at the Sessions.

The election of officers resulted in J. J. Comerford, of Detroit, being re-elected president. John E. Lloyd, of Philadelphia, was elected first vice-president; H. G. Foote, of Minneapolis, Minn., second vice-president; John Claney, of Chicago, was re-elected treasurer, and C. A. Bowen, of Detroit, was re-elected secretary.

The entertainment features of the meeting included a boat-ride and dance on the first evening, and a jazz party, supper and dance on the second night. Special entertainment was provided for the ladies who attended the meeting.

Among the Canadians, who took part in the convention, were: J. B. Reid, Toronto, vice-president of the Ontario Retail Lumber Dealers' Association; J. C. Scofield, of the Windsor Lumber Company, Windsor, Ont.; Chester D. Belton, of the R. Laidlaw Lumber Company, Sarnia, Ont.; W. A. Hadley, of the S. Hadley Lumber Company, Chatham, Ont.; E. C. Russell, Walkerville, and H. Boulton, secretary of the Ontario Retail Lumber Dealers' Association, Toronto.

Home is the Surest Defence Against All Ills

For the Sake of Posterity, National Well Being and Progressive Civilization, Every Citizen Should Own His Abode—Its Power and Uplifting Influence

Much has been written and printed on the question of people owning their own homes—the advantage, benefit, wisdom, stability, economy, purpose, and strength of such a movement. One would think all these attributes or claims made on behalf of owning a home were sufficient in themselves to convince the ordinary individual, without being “fed up” on these truths or facts so many times. Nevertheless, it appears necessary to keep hammering away at things which all persons should know and appreciate. New converts of the home building plan are, of course, made by this method. The incessant presentation of a fact, the reiteration of a statement, the repetition of a mental picture or the recurrence of a thought will in time create an impression on most anyone and arouse conviction, courage or action.

The things to be remembered is that the ideas of every generation seem to change and young people are now brought up with conveniences, delights and attractions that were never possessed by their parents even at the close of life. To labor shorter hours, spend more money and have only one object in view; that of a rollicking good time, appears to be the animating motive in many careers, particularly in the urban centres. Of course, it is essential to counteract this baneful influence through the medium of publicity, in the hope that it may compel the thoughtless, frivolous and happy-go-lucky to pause and think.

Why Not Start Out Aright?

There is no valid reason why young men and young women should not begin life in homes, owned by them, rather than spend a decade or more paying rent to someone who has no interest in their welfare other than the receipt of the monthly cheque. It may require a little restraint, some measure of economy and self-control, as well as a vision and a purpose, but all these things are worth while and pay ample dividends later on. The “Retail Lumberman,” of Kansas City, recently offered some valuable prizes for the best article on the subject “Why people should own their own homes?” The contest was limited to retail dealers or the members of their families or employees. The first prize was awarded to John P. Barton, manager of the Simpson Lumber Company, Stroud, Okla. After due consideration the judges awarded him the premium for not only having set forth the best arguments, but adhering most closely to the purpose outlined in the contest.

The points advanced by Mr. Barton are so pertinent, the facts so well arranged and the matter so logical that the “Canada Lumberman” believes his remarks which follow will be read with much interest and appreciation.

Economic Aspect of the Problem

There are three great reasons, or rather three great divisions of the many thousands of reasons, why people should own their own homes. These divisions I shall call the reasons of economy, the reasons of utility, and the reasons of Ethics.

Let us first consider the economic reasons—not because they are necessarily the most important, but because it usually comes natural for us to think of the things which affect our pocket-books first. The extravagance of being a perpetual payer of rent month after month and year after year, although an old argument in favor of building your own home, is, and always will be a mighty good one. The advantage of a warranty deed over a pile of rent receipts is one which cannot help to appeal to any thoughtful person.

Added to this there is that double source of expense and annoyance, the moving van, as the average renter moves, either through “beggar’s choice” or downright compulsion, several times each year. A rented house almost never exactly suits the renter. As soon as he moves into it he begins to notice bad features and he looks forward to the day when he can move into a house which will suit him better. Unfortunately, after he makes a move to better himself, he finds other undesirable items about the new place which often make it even more unpleasant than the one he just moved from. If by a rare chance he is lucky enough to get a rented house which is about what he wants, the chances are that it will be sold by the time he gets settled down to enjoying life, and he is forced to make a hasty move on short notice into any vacant house there is available.

Besides the direct expense of these moves, there is always more

or less furniture damaged and furniture sacrificed and discarded and new bought to fit the changes in the amount of room and the arrangement of each different house. The rugs which you bought for the rooms of the house you have just moved from are either too large or too small for the rooms of the house you move into. There is no suitable place for the book-case which you bought to fit a certain nook or corner in the other house. The window blinds are all the wrong size so they must all be scrapped and new ones bought. Every thing that was just a fit in the other house is now a hopeless misfit. For this reason it is not usually possible or practical for renters to own such attractive or comfortable furniture as the home owner of no greater income is able to afford.

Every Housewife Knows This

In practically every community in the United States it is now possible for thrifty people of moderate incomes to build or buy their own homes and pay for them in easy payments like rent. It is almost impossible to overestimate how much the renter adds to his financial and business chances by starting in to pay for his own home on this plan. He will automatically adopt new habits of thrift, and unconsciously he will strengthen his financial stability and gain increased respect and esteem in the eyes of his employer and business associates. The very act of making these regular payments on his home gives him the hopeful, confident feeling of a wise investor and encourages him to systematic saving and the accumulation of a bank account. If he needs additional capital to take advantage of a business opportunity, he can borrow money when credit would be refused to the less reliable rent payer. His employer will feel more inclined to give him the preference in any opening for advancement and his salary will grow as new responsibilities are trusted to him. When he started to buy this home he took a good long stride on the highway of achievement toward the goal of financial and business success.

From the standpoint of utility the rented house is almost never so useful to you as the house you build for yourself. Your rented house may be someone else’s idea of a home, but too often it is not even this. If it was built for rental purposes in all likelihood utility, convenience and comfort had to sacrifice for economy and cheapness of construction. But perhaps the most numerous and least desirable type of rent house is the old home which the builder has outgrown and building himself a modern house rents out the old “shack.” Such a house has the unpleasantness of a cast-off suit of clothes about it. It is generally the most uncomfortable and least useful kind of house which a renter is compelled to live, or rather to exist, in. However, at this time, the whole country is so under-built that renters are often forced to accept any kind of makeshift houses.

Another unfortunate condition which develops is the perpetual petty warfare of renter vs. landlord, on the subject of repairs, upkeep and improvements. If the renter takes a proper pride in the house he lives in he is liable to push the landlord a little too strong for expensive repairs and improvements. When these are refused the renter loses his pride and develops a hatred for all landlords and seeks revenge by abusing and often maliciously defacing the property which he rents. This unhappy condition causes renters, as a rule, to become shiftless and indifferent about the care of their premises, and this lack of pride becomes so habitual as to cheapen the quality of their work and to blunt their ambition, and is a great obstacle to their success in whatever line of work they may follow.

Ethical and Social Advantages

In what contrast is the more pleasant state of the man of grit and foresight who builds his own home! In the first place he can choose his building site in a congenial neighborhood. And then he and his good wife, for the good wife must always be a co-partner in the building of a real home, they two together create a home from their dreams. Each room they plan for their own special convenience and comfort. They have always wished for a certain arrangement of the rooms, or perhaps for special built-in features constructed according to their own particular ideas. It has been impossible for them to get these things in perhaps a dozen houses which they have rented, but now they are building their own and building it just like they want it. When the house is completed it is more than a mere house, it is truly their Home, a wonderful realization of their own individual hopes and aspirations!

Reducing Heavy Cost in Logging Operations

How the Employment of Modern Equipment Eliminates Work and Worry, Speeds up Production and Increases Efficiency—The Standard Steam Hoist

By "Woodsman"

This summer the writer had the privilege of assisting at the raising of a forty-eight feet long flag pole at the summer cottage. The pole was fresh cut, full of sap, and very heavy, and the man power available was, to say the least, inadequate for the job. We got it up eventually by the exercise of much muscular effort, also by the "sweat of the brow" and various other portions of the anatomy. But that experience impressed on all of us very forcibly the old, old lesson that green lumber possesses great weight, and that it pays to use labor-saving appliances if they can be procured. We knew it before, of course, but that one experience changed theoretical knowledge into practical knowledge, and we can now appreciate as never before the value of labor-saving tools to the men who are handling logs and heavy timbers every day, namely, the Canadian lumbermen.

Labor-saving methods for lumbermen are much better known in British Columbia and in the Pacific Coast States than in Ontario,

10 H.P. double drum, belt driven hoist for handling logs, made by Marsh Engineering Works, Belleville, and in operation in the bush in Ontario

Quebec, or the Maritime Provinces. The reason for this is easily found in the larger and heavier type of timber that is logged all along the Pacific Coast. Logs that run anywhere from five feet to nine feet in diameter cannot be handled readily by man and horse power alone, or by man and ox power. These nine-foot logs have, it is true, been moved in the early days of Pacific Coast lumbering by long strings of oxen, urged on by the whip lash, but it was a tremendous task, slow, tedious, and costly in wages, even in those days of cheap labor. But necessity, that fertile mother of so many valuable inventions, forced the invention of better methods, and gradually through the years many types of special machines have been evolved to take care of these mammoth timbers at every stage of the journey from the stump to the saw. There are probably half a dozen firms in British Columbia and in the Western States who specialize in the designing and building of the large, powerful, complicated and costly skidding and loading machines that years of experience have proven to be necessary to the economical handling of the heavy western spruce, fir, cedar and red wood. There are probably as many methods of moving and transporting these logs as there are varieties of machines, each of these methods being claimed to be the very best for the particular locality and conditions where it was developed.

Cheapening the Cost of Production.

Here in the East, however, conditions are entirely different. The logs are usually not too large to be moved by horse-power on sleigh or wheels. Moreover, they do not have to be transported up or down steep mountain sides, so the problem of getting them from the stump to the saw is very much simpler than it is in the West, in consequence of which necessity has not forced upon the lumbermen the development and application of labor-saving methods.

Nevertheless there are here and there a few of the larger and more progressive lumbermen in Ontario, Quebec and the Maritime Provinces who have made a beginning in the use of labor-saving machinery, not because of heavy timbers or unusually difficult surface conditions, but as a matter of deliberate choice and careful planning in order to cheapen the cost of production and thereby increase profits.

One large producer in the Ontario hinterland has for some ten or twelve years been using the standard steam hoisting engine which is in such general use by the larger builders and general contractors all over Canada. And it is only natural that he should take to the use of this engine in the woods, for the same engine that has been found so useful in the placing of heavy timbers in construction work should be equally as useful in the handling of these same timbers in the bush. Moreover, these machines are strongly built to withstand rough usage, are simple in operation so they do not require an expert engineer to run them, and are compact enough and light enough to be moved about from place to place as necessity arises, so they would appear to be eminently suitable for use in the woods. In fact, so useful has this particular lumberman found these standard steam hoists (of twenty or twenty-five horse-power) that he has gradually been adding one machine after another to his equipment year after year until he now has at least seven of one make, and two more of other makes. Although these machines are incomparably cheaper than the ponderous and elaborate specially-designed machines necessary on the Pacific coast (the before-the-war price being in the neighborhood of eight hundred or ten hundred dollars according to size), yet all these machines that he has been accumulating from year to year represent a considerable investment of capital withdrawn from circulation and bringing in no interest. But this same lumberman is a shrewd, far-seeing financier, and knows well that these machines are earning him good dividends, even though he is able to use them for only two months in the year and they are idle for the remaining ten months of each year.

The Efficiency of the Hoists.

Regarding the nature and quality of the work done by these engines, the writer was informed recently by one "in the know" that these engines are all used principally for loading on cars, and that the quantity loaded is only limited by the quantity furnished to the hoist, and that under favorable conditions one machine will load

Skidding logs in an Ontario lumber camp by modern methods. Only one man is required to operate the hoist

from 1,500 to 2,000 logs per day, either pine or pulp wood. The users of these hoists say that there is no comparison between hand work and engine work, so far as loading logs on cars is concerned. Some attempt has also been made during recent months to use these machines for taking logs out of water, but there are a number of improvements still to be effected in their operating methods to make this system as fully successful as the car loading system has proven to be. Moreover, although some of these engines have been in service for a number of years, very little repairs have been needed

on any of them, showing that this type of machine is well adapted for use in the woods.

There are, of course, other lumbermen using this same type of machine, and this one lumberman is cited only as an instance of what is being done in Ontario, and of what could be done to a much larger extent in all of Eastern Canada only for the handicap of our inbred conservatism, which makes many of us satisfied with things as they are. But as labor costs continue to mount up the absolute necessity of adopting labor-saving machinery and methods will be forced upon the lumbermen until in time practically all except the very small producers will be using some form of labor-saving and profit-increasing machinery for piling, loading, skidding or hauling logs.

The photographs reproduced in this article were taken last winter in an Ontario lumber camp of medium capacity, and show how the gasoline engine is also being utilized by some progressive operators because of its lightness and the ease with which it can be moved about from place to place as required. The fire risk is also much less than with the steam-driven machines, as there is no smoke stack throwing out sparks to set fire to the immediate surroundings. The belt driven hoist which the gasoline engine is operating is exactly the same type as the steam-driven machines referred to above, but is a smaller size, being only ten-horse power rated capacity. It is also the standard two-drum contractors' and builders' hoist, and because it is a standard design and produced in quantities can be sold more cheaply than a machine of special design. This standard machine is built for either steam or electric or belt drive, and in a number of horse-power sizes, so that any lumberman can choose the right size for his work, and probably get delivery from stock.

Sawmills Use them for Loading Cars

The logs seen in the accompanying view, which were cut last winter in this particular camp, were about the average size of present-day Ontario logs, the largest measuring about thirty inches in diameter, and up to fourteen feet long. This little ten-horsepower machine was used for piling the logs in skidways, and also for loading the logs on cars. For piling on skidways it was found convenient to deck three or four skidways at each placing of the machine, thus saving time in moving the outfit. As used by this operator this little machine handled one thousand logs per day, piling them fourteen logs high, and worked right through the coldest weather, even when the mercury reached twenty below zero.

The officials in charge of the Canadian Forestry Battalions well knew the value of these hoists for logging purposes, and before they sailed from Canada purchased a number of these standard steam-driven machines from stock, of the twenty and twenty-five horse-power sizes, and took them with them overseas. These machines were used to such good advantage overseas, in both England and in France, that the British and French authorities were delighted with their performance, and the officers in charge of the Battalions, now returned to Canada, speak in the highest terms of the valuable assistance these Canadian-built machines rendered in expediting the production and delivery of the timbers so urgently needed in so many ways for the prosecution of the war. They speeded up operations over there as they had been doing here, and as they will continue to do in constantly increasing volume in Canada as Canadian lumbermen become better acquainted with their possibilities.

But it must not be thought that the lumberman is the only man in the lumber industry who is taking advantage of these labor-saving tools and making them earn money for him. The saw mills and the pulp mills are also finding uses for them, using their tremendous strength for lifting and placing logs, timbers and heavy sections, and also for moving loaded cars. For instance, one Quebec mill was confronted with the problem of placing loaded cars of lumber weighing up to eighteen or twenty tons. A small dinky locomotive would have done the work, but at considerable expense, and hand power was also too costly, but on investigation it was discovered that one of these little ten-horsepower standard hoisting engines, with only one drum, could easily do the work, and at much less cost, both for initial outlay and for operating expense. So one was bought and installed, taking steam from the power plant already in position, and did the work to the entire satisfaction of the mill operators. Other mills have installed the belt-driven machines, or the electric-driven, as suited their local conditions best, and for the same purpose, that is, for moving and placing loaded cars.

Economy and Service of Gasoline Tractor.

Another labor-saving tool used by a few of the wide-awake lumbermen of Ontario and East is the gasoline tractor with various forms of caterpillar tread. This will haul a regular train of wagons or sleighs loaded with logs, and under suitable local conditions is

perhaps the best tool yet devised for the purpose for long hauls to the mills or to the railroad.

For the shorter distances, where the logs are being cut not too far from the track or the mill, it is possible that some of the various cableway systems that have been developed on the Pacific Coast and in the cypress swamps of the Southern States could be used to good advantage in Eastern Canada in place of the horses that are now used so commonly. The logs could be moved at much greater speed, and at a considerable saving in wages and other operating costs. For the small timbers now being cut in Ontario and East the standard hoisting engine as used by builders and contractors and referred to above could easily be utilized, and would do the work equally as well as the more elaborate and more expensive specially designed machines of the Pacific Coasts.

Cableway Hauling of Logs

The writer knows of one Ontario lumberman who bought one of these expensively designed outfits from somewhere in the States. It was a large machine, occupying the whole floor of a flat car, and impossible to use except on its own car. It was probably all right for the heavy Western logs for which it had been designed, but according to common report was unsuited to our smaller logs and was soon dispensed with. If this machine had been desired (as is likely) to haul the logs from the stump to the track and then to load them on a car, the same work could have been done by one of the various cableway systems, using the standard hoists, at a much less expenditure of capital. It has been abundantly proven in practise that these standard machines are quite capable of operating almost any kind of cableway system of hauling logs, either for hauling them along the ground or suspended wholly or partly in the air, according to the distance and the nature of the ground to be traversed.

This cableway hauling of logs has not been practised as yet to any great extent in Ontario, Quebec, or the Eastern Provinces, but it is safe to say that the time is now far distant when it will largely supplant the more expensive horsepower hauling which is now in such common use.

More Aggressiveness in Pushing Coast Products

Logging operations on an extensive scale are being carried out on Toba Inlet, B.C., by the Canada Timber and Lands Company, of Toronto. Mr. E. Stewart, of Toronto, managing director and secretary-treasurer of the company, recently paid a business visit to the Coast, and, in an interview respecting conditions in the East, said that there was a splendid market for British Columbia forest products. Of course, there was always the question of freight rates to be considered, but, despite that, he was of the opinion that more and more B. C. lumber and timber would be used in eastern Canada as it became better known. In this connection, he said, a policy of more aggressiveness was needed to push the coast product, which was of such a quality that it could hold its own anywhere on the North American Continent. Mr. Stewart was highly optimistic of the future for B. C. lumber and said the demand for it in the east was becoming greater every day.

The fact that his company, which has its headquarters in the east, is pushing its logging operations ahead so rapidly is indicative of the demand that is being made for coast lumber. While there was some yellow pine coming from the United States, it was well known, said Mr. Stewart, that the supply of that commodity is being rapidly lessened and for that reason, he urged the trade out on the coast to bestir itself with a view to obtaining a firmer hold on the eastern Canadian market. That was the point that the B. C. lumber industry must ever keep before it, Mr. Stewart remarked, namely the securing of a better foothold in eastern Canada, and there was no reason, he added, why B. C. should not be the principal source of supply to that part of the Dominion.

Opens New Warehouse in Detroit

The Carborundum Company, of Niagara Falls, N.Y., announces the opening of branch offices and warehouse in Detroit, Mich. The new quarters will be located in the Burkhardt Building, at Second and Larned Streets, and under the management of Mr. Anthony Dobson, who is in charge of the Detroit sales district. The new offices and the warehouse are opened with a view to giving quicker and better service to the users of Carborundum products in the Detroit district, and to that end a complete stock of Carborundum and Aloxite grinding wheels, Carborundum and Aloxite paper and cloth and other Carborundum products will be carried. The opening of the Detroit branch is just another indication of the progressive policy of the Carborundum Company.

How Long Will the Timber of Canada Last?

If Proper Measures of Protection and Reproduction are Undertaken There is Little Danger of Famine — Improved Methods of Utilization Urged

With the conclusion of the war and the enormous possibilities of trade with devastated Europe in forest products, Canada is confronted by an amazing ignorance of the extent of her forest resources, says R. G. Lewis, in a timely and comprehensive article, which appears in a recent addition of the "By-water Magazine." Not so many years ago, adds the author, who is on the staff of the Forestry Branch, Department of the Interior, Ottawa, such expressions as "boundless forests," "unlimited forests," "unlimited timber wealth," and "inexhaustible supply of lumber," were commonly in use in describing these resources.

From this extreme we have passed to a temporary state of panic, when certain pessimistic individuals prophesied that our present supply of timber would not last more than 10, 20 or 30 years, depending on the depth to which the spirits of the respective prophets had fallen. While there is no doubt of the urgent necessity for better protection from forest fires, better administration of forests lands, improved methods of utilization, and, in some instances, actual reforestation, there is no immediate danger from a wood famine, and, if such measures are taken, no danger of such a famine in the near future.

Complete Stock Taking is Advocated

The first step necessary to provide for a future supply of forest products is a complete stock taking of our forest resources. It does not appear logical to make complicated plans for the administration of forests, the extent and nature of which are not accurately known, nor to build up an extensive export trade in a commodity in ignorance of the supply available, nor to encourage returned soldiers and other settlers to take up land, the suitability of which for agriculture is a doubtful question, yet all these things are being done with incomplete and inaccurate information.

Forest surveys, conducted by technically trained foresters, are designed to determine with reasonable accuracy the extent and nature of the existing forests, the quantities of the different forest products they contain at present, and what they can be relied upon to produce in future years, the area of land suitable for agriculture at present forested, and the area which is suitable only for forestry purposes.

Such surveys have been made and are being made at the present time in certain parts of Canada. Dr. B. E. Fernow, late Dean of the Faculty of Forestry at Toronto University, in 1909 and 1910, conducted a reconnaissance survey of the forests of Nova Scotia, the first provincial forest survey attempted in Canada. This survey was made by foresters with the idea of determining not only the present stand but the future possibilities of the province as a timber producer. It did not attempt to supply detail for commercial purposes. To quote from the report, "This fact will be appreciated by practical men when it is stated that a reconnaissance and not a detail survey is involved, and that the total expenditure, including the compilation of data, map and report, did not exceed \$6,000. The field work alone had, therefore, to be accomplished for the remarkably low cost of twenty-five cents per square mile of country, while any attempt at estimating the standing timber closely would have involved an expenditure of from \$10 to \$20 per square mile."

Valuable Facts Revealed by Survey

This survey established some interesting and valuable facts. Two-thirds of the area of the province consists of non-agricultural land covered with forest growth and not fit for any other use than timber growing. The actual green forest area consists of five million acres, to which is added recently-burned forest and better class barrens which can, eventually, be reforested. Ten per cent. is hopelessly barren. Less than 100,000 acres of virgin or semi-virgin timber remain. The quantity of coniferous timber was estimated at about ten billion feet.

The results of this survey were published by permission of the Department of Crown Lands of Nova Scotia by the Commission of Conservation.

A survey of Crown Lands in New Brunswick was begun in 1916 by a staff of foresters from the University of New Brunswick. Mr. G. H. Prince, the Provincial Forester, states that over a million and a half acres of Crown Lands have been covered by survey up to date, classifying the land of timber and the future possibilities of the land for producing timber. The work of surveying the seven and a half

million acres of forest land belonging to the Crown has not proceeded far enough to warrant a definite estimate of the total stand of timber, but the information gathered up to the present would indicate something in the neighborhood of 13 billion feet of saw-timber. The privately owned timber land, about five million acres in extent, has been estimated to contain about the same quantity as the Crown Lands, making a total of, approximately, 25 billion feet of standing timber in New Brunswick.

An extensive study of the forest resources of British Columbia has been completed by Messrs. H. N. Whitford and R. D. Craig of the Commission of Conservation, and the complete report with maps is now available for distribution. This investigation is based on a large proportion of actual cruises (about 65 per cent.), the data being furnished by the British Columbia Forest Branch, the Dominion Forestry Branch, the timber owners, cruisers, surveyors, and others. In many cases more than one report for a single area was obtained and the estimates could thus be checked and, if necessary, revised. In addition to the estimates of standing timber, the report discusses geographical, physiographic, climatic, and soil relations, ownership of land, forest administration and policy, methods of logging and manufacture, descriptions of the tree species native to the province, and the insect injuries to the forest.

Divided Into Two Main Regions

In making up the total estimate of standing timber, the province has been divided into two main regions, the Coastal Belt and the Interior, separated by the axes of the Cascade and Coast Mountains.

The Interior has been divided into six regions and subdivided into forty drainage basins. The Coastal Belt has been similarly divided into five regions and twenty-six drainage basins. A separate estimate of the timber by species, a classification of the land and a description of the geology, topography and transportation facilities for each of these sixty-six drainage basins is included in the report.

The estimate of standing timber in the Province of British Columbia is 350,835,000,000 board feet of saw material, and 15,465,000,000 board feet of pulpwood, piling, poles, and other small material. This total is made up of 136,534,700,000 board feet for the Interior and 214,299,460,000 board feet for the Coast region. This estimate includes with the total for the saw timber, 170 million feet of such species as spruce, hemlock, balsam, and cottonwood, which are suitable for pulp manufacture, and with the total for the smaller material, another nine million feet of pulpwood, which, together, would make a total of 255 million cords of pulpwood available in the province.

The forest land in the Prairie Provinces is under the administration of the Federal Government, together with that in the Railway Belt and the Peace River Block of British Columbia. This administration is divided among different branches of the Interior Department, and, while accurate information is available for certain areas, no survey covering all the forest land has yet been made.

An investigation of forest conditions in the Province of Saskatchewan was conducted by Mr. J. C. Bloomer of the Conservation Commission, but the final report is not yet available.

A preliminary summary of the information gathered is as follows:

	Board Feet
Spruce saw timber	3,000,000,000
Poplar saw timber	4,000,000,000
Pine (jack pine) timber	800,000,000
Total saw timber	7,800,000,000
	Cords
Pulpwood (spruce, balsam, fir, and poplar)	55,000,000
Cordwood (jack pine)	78,000,000
Birch, tamarack and willow	17,000,000
Total	150,000,000
Total equivalent in board feet	83,000,000,000
	Acres
Approximate total forest area	98,200,000
Total wooded land area	73,000,000
Total area under present commercial spruce forest	750,000

The Stand in the Prairie Provinces

For the three Prairie Provinces of Manitoba, Saskatchewan and Alberta, the estimate is as follows:

	Board Feet
Spruce and tamarack	8,000,000,000
Poplar	12,000,000,000
Pine	3,000,000,000
	23,000,000,000

The statistical year book of Quebec for 1915 contains an estimate of the forest resources of the province. Neither a survey similar to that made in Nova Scotia nor an investigation of forest resources similar to that made in British Columbia has yet been made for the province, but the work of collecting data concerning the forest area is being carried on every year. The text of the year book does not state on what information the following estimate is made, but as it is the first official statement published it must be accepted as such until confirmed by later information.

	Board Feet
Red and white pine	50,000,000,000
Spruce and balsam fir	125,000,000,000
Hardwood (birch, maple, etc.)	35,000,000,000
Cedar	20,000,000,000
Total saw timber	230,000,000,000
Pulpwood	100,000,000,000
Grand total	330,000,000,000

The Timber Possessions of Ontario

Up to the present time no official estimate of the forest resources of Ontario has been published. The lack of information has been more or less camouflage by conflicting and overlapping reports made by different authorities for different classes of resources in different regions, making any attempt at a general summing up impossible.

The present commercial forest is said to cover eighty million acres and to contain nine billion feet of pine on licensed lands, thirteen and a half billion on Crown lands, and 350 million cords of pulpwood of which 250 millions are tributary to railways and waterways. The potential forest area in the Laurentian region is estimated at fifty million acres. South of the Height of Land the pine belt is estimated as above at fifteen or twenty billion board feet and the pulpwood at 200 million cords. The forest area of the northern type is placed at fifty million acres and the southern hardwood type at three million, making a total of 103 million acres of potential forest area. The entire forest resources have been estimated at 100 billion feet, including spruce and balsam pulpwood.

This more or less confusing state of affairs is about to be remedied by an investigation similar to that recently completed in British Columbia. Mr. R. D. Craig of the Commission of Conservation has been given charge of the work of estimating the forest resources of Ontario. The work has been started and will probably be completed in two or three years' time. The size of the province, the comparative inaccessibility of much of its area and the diversities of climates and topography giving rise to diversities of forest types, make this a difficult undertaking, but one which will undoubtedly warrant the expenditure of time and labor involved.

On the completion of this study and the completion of the survey work being undertaken in Quebec and New Brunswick, it will be possible to make a reasonably accurate estimate of the total resources of the Dominion. With the information at present on hand, it is only possible to state that these resources represent a total area of about 250 million acres, containing from 500 to 800 billion feet board measure of merchantable saw timber and 800 million to one billion cords of pulpwood.

Lumber Priced by the Hundred

Material has advanced by leaps and bounds, and the price by the thousand seems almost prohibitive. Yet if we could educate our customers to buy by the piece, and not by the thousand, we would do away with much of the criticized "high prices."

We all know that the increase in price of material is getting unreasonable, and the market is such that we must get the advance in price in order to show any profit for ourselves—so we must seek some other method of doing business. The whole world is undergoing a change, and we feel that our business methods must likewise make a change or we will be holding the sock, and someone will come in and reap the reward. So we must educate the trade to buy by the foot and piece method, because of the many advantages in our favor.

We will admit that it will be inconvenient at first, but as soon as this method is adopted and used universally it will be a big improvement and will be a better method of handling our competitors, and will save much of the price cutting, as price cutting does not mean meeting competition, it simply means getting scared. You know better than your customer if your material is priced right, and we should also know why substituted articles are lower priced. If we make the difference clear in our own minds, we can make it clear to our customers.

VANCOUVER, B. C.

Note the thickness 3 layers.

One of the attractive newspaper advertisement series of the Shingle Agency of B. C.

If our competitor wishes to underprice an article, let him sell that particular article, but talk quality and service, and the majority of times you will make the sale. We must not cut our own throats for the sake of keeping company with our competitor.

Sears, Roebuck & Co., Montgomery Ward & Co., Chicago House Wrecking Co., and Gordon Van Tine are using the piece method and have been for years. We noticed in the latest catalogue of the Western Hardwood Lumber Co. all material is priced by the foot instead of by the thousand.

Ten dollars a thousand on lath is very high, but since we have been selling them at one cent each, we have had little criticism. 1-2 x 4-16 at \$6.00 per thousand, we always figure eleven feet 66 cents and on selling 100 would amount to \$66.00. Retailing 100 out at \$60.00 per thousand, we would receive \$64.02, or a loss of \$1.98 on 100 pieces, and 66 cents does not seem nearly so high as \$66.00 per thousand.

The majority of people that come to the yard are familiar with lumber sold by the thousand, but not by the piece, so there is a great help.

How many times in the last year have you heard this assertion? "What, lumber \$60.00 per thousand." When I built my house two years ago, lumber was only \$30.00. Now if we had quoted him by the piece, he might have thought it high, but probably would not have known if it was \$30.00 or \$60.00 per thousand.

I do not believe one person in ten coming to our places of business would stop to figure out the price per thousand if quoted by the piece, and the majority of people could not figure it out, and too, we forget the small things but never the large ones, so, by the piece we have the advantage, as they are not so apt to remember that a 2 x 4-12 cost 48 cents, as they would were it priced at \$60.00 per thousand.

There is not a day we have not heard "Prices are too high." How are we to overcome this? I think the best solution will be to change our method of doing business, and quote by piece and foot.

I believe from personal observation that there is a certain amount of business that can be developed and handled by the right man and right methods. He must be a man of imagination and able to meet unfavorable conditions and unable to lay down on the job and say it can't be done. Are we that kind of men?—W. R. Coats before the recent Alberta Industrial Congress at Calgary.

Personal Paragraphs of Interest

R. S. Potter, of the R. S. Potter Lumber Co., Matheson, Ont., has been nominated by the Conservative party as its standard bearer in the Cochrane riding in the forthcoming provincial election.

Guy C. Long, of the Long Lumber Co., Hamilton, and wife are enjoying an extended holiday trip throughout the western provinces. They will visit several points on the Pacific Coast before their return.

Ed. Harper Wade, of Quebec, recently returned to his office after an attack of para-typhoid which is a most tedious illness. His many friends in the industry are pleased that he is now able to resume business.

E. C. Knight, managing director, Vancouver Lumber Co., Vancouver, who attended the recent National Industrial Conference in Ottawa, was in Toronto recently for a short time on his return to the West.

Brig.-Gen. J. B. White, of the Riordon Pulp & Paper Co., is on the general committee for the military ball to be given in Montreal by the G. O. C. and officers of District No. 4 in honour of the Prince of Wales. October 28 is the provisional date fixed.

Wm. Henderson, of Toronto, superintendent of the Shantymen's Christian Association, left recently on an extended trip to British Columbia, where he will spend a couple of months in the lumber camps, particularly in the inland district of the Province.

Alfred E. Clark, of Toronto, chairman of the Wholesale Lumber Dealers' Association, Quebec, has closed up his summer home at Grimsby Park where he spent the summer with his wife and family and is now at his Toronto residence, 17 St. Andrews Gardens.

L. G. Farr, general manager of the North Anson Manufacturing Co., North Anson, Me., and A. E. Hamilton, sales manager, have been on a buying trip to Montreal, Toronto and Ottawa, returning home by way of New Brunswick. They have made some large purchases of lumber.

Clixte Chenier passed away recently at the age of 70 years after an illness of several months, which developed into anaemia. Mr. Chenier, who was a resident of Buckingham, Que., was highly esteemed as a citizen and is survived by two daughters and one son. He has been engaged in lumbering all his life.

Among those who attended the annual conference of the National Retail Lumber Dealers' Association in Detroit recently were W. A. Hadley, of Chatham, president of the South-western Ontario Retail Lumber Dealers' Association; J. C. Scofield, of Windsor; E. C. Russell, of Walkerville and C. H. Belton, of Sarnia.

Joseph Oliver, of the Oliver Lumber Co., Limited, Toronto, who is Deputy Grand Sire of the Sovereign Grand Lodge, Independent Order of Oddfellows, attended the recent annual gathering in Baltimore, Md. It is expected that next year Mr. Oliver will be elevated to the highest position in the gift of the Order, that of Grand Sire.

Frank A. Kent, of the Seaman, Kent Co., Toronto, intends leaving toward the latter end of the month on a business trip to England. Mr. Kent reports that the plants of the company are very busy at the present time and are shipping large quantities of maple hardwood flooring to the Old Country. Mr. Kent expects to be absent on business for several weeks.

John J. Miller, who has been chief inspector for the National Hardwood Lumber Association in Toronto for the past seven or eight years, is now in charge of the hardwood department of the C. G. Anderson Lumber Co., Toronto. Mr. Miller was formerly deputy inspector of the Association at Buffalo and is well known to all the hardwood lumber manufacturers, wholesalers and dealers in Ontario.

A. E. Richards, who was for three years overseas and is a former resident of Burlington, Ont., has taken charge of the Sitka spruce end of the British Columbia business of Terry & Gordon, Toronto, and has his headquarters at Prince Rupert. Mr. Richards has been busy for some time in the shipment of Sitka spruce and a scow load of about 400,000 ft. principally of 2 in. stock has been going forward every week.

G. Brocklebank, representing C. V. Haerem, timber agent, Manchester, England, spent a few days in Toronto recently, calling upon the members of the trade. Mr. Haerem specializes in soft woods, and is particularly interested in British Columbia forest products. Mr. Brocklebank intends taking a trip to the Coast before his return home. This is his first visit to Canada and he speaks in appreciative terms of the reception accorded him.

Rev. Oswald J. Smith, 708 Dufferin Street, Toronto, who recently returned from spending several months in religious work among the logging camps in British Columbia, has been appointed secretary of the Shantymen's Christian Association and will make his headquarters in Toronto. R. D. Richardson, 103 St. Clair Ave., Toronto has been secretary treasurer of the Shantymen's Christian As-

sociation for some time, and retains the office of treasurer. The work has become so important and responsible that it was deemed advisable to divide the office of secretary-treasurer. Rev. Mr. Smith was formerly associate pastor of the Dale Presbyterian Church, Toronto.

J. J. Elliott, of the Elliott Woodworking Co., Toronto, recently returned from a successful business trip to Great Britain. While there he formed a company known as the Dominion Machinery Co. of Halifax, England, to manufacture and handle the Elliott combination woodworker for Great Britain and the Continent. He reports a strong demand for this machine and brought back orders for more than one hundred and fifty machines.

H. L. Hebard, who has been in the employ of the National Hardwood Lumber Association for many years in the New England district and latterly in Toronto, assisting J. J. Miller, inspector, who recently resigned, has been appointed as successor to Mr. Miller and has entered upon his new duties. The selection of Mr. Hebard is one that will prove acceptable to the members of the association and is another instance of a promotion well deserved.

Mrs. William Rutherford, wife of the founder of the firm of William Rutherford & Sons, Company, Ltd., Montreal, wholesale & retail lumber merchants, sash & door manufacturers, died on September 23, in Montreal, aged 83. The late William Rutherford predeceased her by sixteen years. She is survived by two daughters and five sons, three of the sons being connected with the firm, Mr. William Rutherford, president; Mr. Andrew Rutherford, vice-president; and Mr. Stewart F. Rutherford, secretary-treasurer. The last named is also managing director of the Dominion Box & Package Co., Ltd.

Lieut. Larkin Back in Lumber Game

Lieut. H. W. Larkin, who returned several weeks ago from overseas, has embarked in the wholesale lumber business on his own account and opened an office in Canada Permanent Building, 18 Toronto St., Toronto, under the name of the Larkin Lumber Company. He was born in Brandon, Man., and is a son of C. A. Larkin, a former widely known lumberman of Toronto who retired at the commencement of the war. Lieut. Larkin was with his father and, after the business was incorporated in 1909, he was made secretary-treasurer of the company. He has had a wide experience in the industry, particularly in the selling and distribution ends. He took an active part in the management of the affairs of the Larkin Lumber Co. and when European hostilities broke out enlisted for overseas service. He left Canada in 1916 with the 48th Battery and in the spring of 1917 crossed to France where he was attached to the 13th Battery and 4th Brigade headquarters, being Adjutant of the latter from December, 1917. Lieut. Larkin participated in all the "shows" from Vimy Ridge until the signing of the armistice and, although in the thick of the fray at all times, managed to escape unscathed. He was awarded the M. C. for his splendid work. In the lumber line the Larkin Lumber Company specialize in softwoods and also B. C. forests products and shingles.

Lieut. H. W. Larkin, M.C., Toronto

The Passing of Hon. Frank Cochrane

Many friends in the lumbering trade will regret to learn of the death of Hon. Frank Cochrane, who was a member of the Federal Cabinet. He had been in poor health for some time but the end came rather suddenly. For many years he was Minister of Lands, Forests and Mines in Ontario and his administration was characterized by firmness, foresight and aggressiveness.

A man of sound judgment, thorough business training, high ideals and devotion to duty he rose from being a lumberjack to occupying a foremost position in the public life of the Dominion. On the formation of the Borden ministry in 1911, Mr. Cochrane who had resigned his portfolio in Ontario, was given direction of Railways and Canals and during his regime demonstrated that he was efficient, energetic and broad-minded. In 1917 he resigned owing to continued ill health, but remained a member of the cabinet without portfolio.

Previous to entering upon political life he was a successful hardware merchant in Sudbury and had extensive business interests in Northern Ontario which country he knew and understood intimately.

Religious Instruction in All Logging Camps

What the Shantymen's Christian Association Has Done in Raising the Moral Status of Men and Banishing Menacing "Isms" from Ranks of Lumberjacks

Mr. Wm. Henderson, of Toronto, superintendent of the Shantymen's Christian Association, recently returned from an extended trip in the interest of the work throughout the Western States and Pacific Coast provinces. The labors of the Shantymen's Christian Association, organized by Mr. Henderson some eleven years ago, have extended in influence, usefulness and activity. In April of the present year work was started in the camps of British Columbia and there are now seven missionaries laboring in that province. During the winter of 1917-18 it was estimated that about 30,000 shantymen were ministered to in the camps of Ontario and those of Quebec as far east as the Laurentian Mountains and as far west as northern Saskatchewan and in Minnesota, Wisconsin and Michigan.

The Shantymen's Christian Association of the United States was organized about a year and a half ago to work in co-operation with the Canadian Association. Everywhere the Good Word is carried by the missionaries and the Gospels, in the various languages spoken by men in the camps, are given free distribution. No collection is taken up at any of the meetings and no general canvass of the big lumbermen employers has been made for funds for the important work. It is interesting to note that the greatest economy has been exercised in the administration of the affairs of the Association and there are no office expenses. The secretary-treasurer for Ontario, R. D. Richardson, 103 St. Clair Ave., Toronto, gives all his services free of charge and last year there were 18 missionaries engaged in the work. This year there have been a great deal more owing to the extension of activities to the camps in British Columbia. Mr. Henderson has pointed out that imparting the fundamental doctrines of the Christian religion has banished Bolshevism and the nefarious work of the I.W.W. and the living exponents of this non-denominational, non-sectarian work have done much to kill the propagation of various "isms" and "cetts" that of late have made serious inroads in labor's ranks in certain western districts, and particularly in mining and construction camps.

Extension of Work in the West

Discussing his recent trip to British Columbia, Mr. Henderson stated that until within the past few months no religious services had even been held in some of the camps of the Pacific Coast provinces. Everywhere the missionaries of the Shantymen's Christian Association have been received by the employees and logging superintendents with much favor and interest. The bearers of Glad Tidings go about their labors simply and quietly and have none of the clerical, starched-up or professional appearance of the fashionable city sky-pilot. The missionaries were taken from one camp to another in British Columbia free of charge by the steam tugs of the various logging companies, or if the destination was at some point which could not be reached by this means, then the journey was generally made in a gasoline launch.

To show the spirit exhibited, here is an exact copy of one of many letters received written by a large lumber concern and sent to their logging superintendant:

"Mr. W. Henderson, superintendent of the Shantymen's Christian Association, and his associates are going north to

visit the various camps in connection with the work of the Association, and we will be glad if you will show them any courtesy you can at our camps, as their mission is purely to preach the gospel at the camps, and we believe they are doing big work throughout Canada and the U. S. at such places as we have in the north. They intend going north tonight so that they will reach Rock Bay in the near future, and as above stated, kindly use them as well as you can while at our camps."

W. T. Overstall, 510 Hastings St., Vancouver, is secretary of the Association in Vancouver and in a recent interview with Mr. Henderson the Vancouver World said in part:

"The idea of the Association, which has been operating in the east for a long time, is to send men into the logging camps who do not represent any particular church. The Association is endorsed by practically all of the churches.

Some Dangerous Doctrines Set Forth

That life is not all sunshine and that there is opposition in certain quarters to this non-sectarian, non-denominational Christian work, is evidenced by a bitter attack which was made upon it lately by the "Camp Worker," which describes itself as "the official organ of the British Columbia Loggers' and Camp Workers' Union." This eight page publication is printed in Vancouver and is evidently strongly Bolshevik in vision and surveillance. It announces, for instance, its constitution, as follows:

"Modern society is divided into two classes: Capitalist and Wagerworking, with interest entirely opposed to each other.

"The present order gives to the capitalistic class an ever increasing supply of wealth and to the wageworker an ever increasing measure of degradation and misery.

"Therefore, a struggle goes on between these two classes.

"As sellers of labor, the workers are compelled to organize industrially, without regard to race, creed or color, not only in order to obtain better conditions, and to resist the ruthless exploitation by capital, but also to educate its members to their class position in society, so that they shall be able to take over the industries and to use them in the interests of the whole community instead of as at present for the benefit of a few."

An editorial entitled "A gospel of the free and easy" is intended to be ironical in tone and to cast ridicule and derision, not only upon the work of the Shantymen's Christian Association, but also on the religious instruction or efforts made by them and upon all organized moral movements to make the world a better and brighter place in which to live and move.

As a sample of the balderdash ladled out in the columns of the "Camp Worker" the following is a fair specimen:

"It seems this society sends men into the camps (we

In the accompanying view, representative of British Columbia logging life and activity, the scenes depicted (from left to right) are—a logging camp; a logging train; when the logs come down the

chute; a log chute, and a donkey engine; and a boom of some of the finest logs in the province, giving some conception of the average large dimensions of B. C. trees.

In the above scenes, representative of British Columbia timber and logging life (reading from left to right) the views are a great rock cut for a logging railway; the island highway, showing some of the monstrous trees of the coast; a night on the shore, depicting

one of the missionaries of the Shantymen's Christian Association sleeping out in the open air; next comes the forest trail, showing a missionary on his route, and last, but not least, is a typical logging railway.

presume to talk about Jesus), and give out books but does not make any collection.

"However, we have no particular desire to frown upon this work. If loggers in coast camps feel that they need their souls saved now and again, and Mr. Henderson and his association continues to provide them with the necessary weapons, free of charge, no doubt they will take advantage of the free and easy offer. But what struck us as pretty amusing was the statement, according to the Vancouver World, made by this Henderson person, to the effect that "books are distributed but no money is taken for them." (All the same Anyox leaflets). This is followed by this peach. "This policy has served to win the confidence of the men who for years had the idea drilled into them by I.W.W. and other radicals that preachers and Christian workers generally were nothing but a bunch of grafters who cared nothing for the workers but only wanted their money.

"Tut! Tut! We have preachers lining up with the boss during labor disputes, assisting in the work of misrepresentation and general villification of men fighting for a mere advance in wages that may cover to some extent the advancing cost of living, while others express the fervent Christian hope that all Bolshies and other agitators should be placed on a ship of stone, flying sails of lead, with the wrath of God for a trade breeze and all the ship's passengers provided with non-stop tickets for Hell. Further, we know that the vulgar language and monkey pranks of Billy Sunday are not done for money and graft. No! No! He runs around like his lord and master in a female night shirt, with no place to lay his head, and when he wants the price of a drink of grape juice he sends his faithful partner, "Ma," down to the beach to see if God has put a dime in a red herring's mouth, or something of that kind. He follows his Master Billy does, even to the point of crucifixion. But it is the worker's crucifixion. These things can be multiplied indefinitely, and if the loggers in the coast camps tell some of these itinerating gents a few home truths they can only thank themselves and the (profession?) they have chosen."

One of the strong points about the association is that it is enabled to carry on its work without any appeals to the men among whom the work is done for any financial assistance. Books are distributed but no money is taken for them. This policy has served to win the confidence of the men who for years had the idea drilled into them by I.W.W. and other radicals that preachers and Christian workers generally were nothing but a bunch of grafters who cared nothing for the workers but only wanted their money.

"We were everywhere received with the greatest kindness and consideration, both by the foremen and the men. We moved backwards and forwards on the logging trains in the camps and where water had to be crossed were supplied with boats free of charge.

"The men were generally very friendly," continued Mr. Henderson, "but many of them have their minds thoroughly poisoned by the Bolshevik teaching of the foreign element. Quite a number of English speaking men frankly admitted that they were Bolsheviks and held that the conditions under which they lived were little better than slum conditions, and this in spite of the fact that the meals to which they sat down could scarcely be bought in a city restaurant for less than a dollar. A Finlander said the working class were slaves, though it was later disclosed that he was earning \$250 per month. The spirit of discontent is being industrially preached among these men, and cannot fail to do a great deal of harm unless something is done to counteract its influence."

Mr. Henderson states that this is the kind of criticism and discouragement which workers have run up against in certain sections of British Columbia, which appear to be hot-beds of anarchy, socialism and Bolshevism. However, the results on the whole have been most encouraging and opposition and censure of the character outlined in the "Camp Worker" only serve to inspire the missionaries to greater achievements and stimulate them with fresh zeal in the splendid work they are undertaking which has been growing from year to year in its results, benefits and efficiency.

"The best thing that ever happened," is the title of an article in the recent edition of the "American Lumberman" which was written by Mr. Henderson. As it sheds considerable light upon the progress of the work in the west, it is worthy of perusal:

The speaker was a member of the Northern Wisconsin Loggers' Association talking to the writer after their last Conference at Ashland, Wis.

By request Mr. John Miller, our assistant superintendent in Wisconsin and the writer, had laid before the Conference the methods of work and aims of the Shantymen's Christian Association in the United States and Canada.

The fact that the work was non-sectarian but carried on by good men of various churches, was emphasized and the advantage this was in the camps was pointed out. The reasons why all missionaries were pledged not to ask for collections in the camps was also explained and it was shown how this dispelled the principal charge made by I.W.W. and kindred trouble makers that all the interest any preacher had in them was to get money out of them was answered.

The history of the results of the work in the Canadian camps was outlined showing how quickly the men dropped their foolish fashion of blowing their stakes, and how the great majority had signed the prohibition petition a few years after this work was started among them. The absence of any I.W.W. troubles in the Ontario camps reached by our missionaries was also a striking testimony to what a little interest shown in the men would accomplish.

After the loggers had discussed the matter, a decision was arrived at expressing their confidence in Mr. Miller's work, and asking that he seek to secure enough assistance to provide, if possible, a monthly service in each of the camps represented by this Association. As a tangible evidence of their good will a small assessment was made on each member to raise a fund to be sent to Mr. H. Martin, the treasurer, 408 South Haynes Ave., Chicago, to help defray the expenses. They also promised that every member would assist the missionaries travelling to and fro to the camps.

This is what the speaker quoted as being "the best thing that ever happened."

The close of the first year of the United States' work shows that over 200 services had been held during the year and about 12,000 reached.

Britain Against Importing Wooden Houses

The Daily News, of London, Eng., says the Standardization Committee of Inquiry into Health does not agree with the recent proposal of Agent-General Wade, of British Columbia, to solve the housing problems by the importation of wooden houses. The newspaper says that a London firm during the past twelve months approached the housing committees and commissioners with suggestions for building houses on the American colonial system. In no case had they been able to persuade the authorities to adopt the proposals despite the advantage in time and money saving. Wooden structures are considered unsuitable to the English climate, and the standardization committee is adverse to buildings of a temporary character.

New Eastern Representative Appointed

Joseph H. Poulin, Montreal

Joseph H. Poulin, Montreal, who has been appointed representative of Terry & Gordon, of Toronto, for Quebec, the Maritime provinces and the New England states, spent a few days in Toronto last week on business. Mr. Poulin has spent some fifteen years in the lumber business and is widely known in the East. Born in Albany, N. Y., he was educated there at the public school, business college and military academy and later took an advanced course under the regents of the University of the State of New York, graduating in 1903. He then spent two years in St. Laurent college, St. Laurent, Que., and was for three years active in railway work being connected with the freight tariff department of the New York Central Railway in Albany and Montreal. He was one

of the organizers and first secretary-treasurer of the Eagle Lumber Co., Limited, Montreal, under the presidency of the late Leonidas Villeneuve, where he remained for several years being also the manager of the Montreal office. Mr. Poulin many times over has covered Quebec, the Maritime provinces and the Eastern States. Until quite recently he was Canadian manager for the Robert W. Hunt Co., of Chicago. As a member of the Terry & Gordon organization he is confidently looking forward to doing a record business for the firm.

Experimental Areas in Forestry Work

G. H. Prince, chief forester of New Brunswick, writes the "Canada Lumberman" as follows: In regard to the experimental plot of about 500 acres, which we are going to initiate this year by making experimental thinnings in several different methods, in co-operation with the Bathurst Lumber Company, good progress is being made. Mr. Angus McLean is very greatly interested in this proposition, and Dr. Howe, of Toronto, recently spent a week in Fredericton laying out the experimental areas. By mutual agreement the area will be reserved from further operation after this winter's cuts have been made for a period of twenty-five years and measurements will be made every few years to determine the results of the different methods of cutting. On some of it the slash will be burned, while on other parts it will be left, as is customary, on the usual logging operation.

Returned Soldiers in Forestry Line

C. E. Maimann, graduate of the University of New Brunswick, who recently returned from overseas and was engaged on the Crown Land Survey for New Brunswick, lately resigned, and has gone to Prince Albert to act as an assistant supervisor with the Dominion Forest Branch. H. C. Holman, B. Sc. F., also a returned soldier, who has been engaged during the past season with the New Brunswick Forest Survey, has gone to take a position with the Dominion Forest Branch in Alberta. Both these men received substantial increases in salary and their many friends wish them continued success in their work in the west. R. D. Jago, formerly of the New Brunswick Forest Service, has returned from overseas, and has resumed work.

Want Quebec Timber Cutting Regulations Altered

At the summer meeting of the Woodlands Section of the Canadian Pulp and Paper Association the following resolution was passed: That in the opinion of this meeting certain changes in the regulations of the lands and forests governing the cutting of timber on Crown lands are essential to the preservation and perpetuation of the forests, and it is respectfully requested that the executive committee of the Canadian Pulp & Paper Association appoint a committee to co-operate with the existing committee of the province of Quebec Limit Holders' Association in waiting upon the Government with a view to urging the necessity of an early revision of these regulations in order to meet present day conditions.

This resolution was submitted to the executive committee of the Pulp and Paper Association, and met with their approval, Mr. J. A. Bothwell, the president, nominating the following committee: Messrs. Ellwood Wilson, Laurentide Company, Ltd., Grand'Mere, Que.; R. P. Kernan, Donnacona Paper Company, Quebec.; W. Gerard Power, River Ouelle Pulp & Lumber Company, St. Pacome, Que.; P. W. Buchanan, Brompton Pulp & Paper Company, East Angus,

Que.; Brig-Gen. J. B. White, Riordon Pulp & Paper Co., Ltd., Montreal; Roy Campbell, Riordon Pulp & Paper Company, Ltd., Montreal; W. E. Clarke, Gulf Pulp & Paper Co., Clark City, Que.; J. M. Dalton, St. Maurice Paper Company, Cap Madeleine, Que.; B. Gauthier, Bathurst Lumber Company, Ltd., Bonaventure, Que.; T. F. Kenny, Jas. McLaren Company, Buckingham, Que.; M. H. Montgomery, Montgomery & Sons, Ltd., New Richmond, Que.; Arthur J. Price, Price Bros. and Company, Quebec; William Russell, Jas. Richardson Co., Ltd., Matane, Que.; R. S. P. Smythe, St. Anne Lumber Co., Ltd., St. Anne des Monts, Gaspé Co., Que.; R. O. Sweezy, Royal Securities Corporation, Montreal; Anderson, Canada Paper Company, Windsor Mills, Que.; A. L. Dawe, Canadian Pulp & Paper Association, Montreal

Mr. Ellwood Wilson has been appointed chairman of the Committee and has addressed a letter to the various members outlining the principal objects of the proposed conference. The matter has also been taken up with Mr. P. G. Owen, secretary of the Quebec Limit Holders' Association, who has had informal conferences with the Deputy Minister of Lands and Forests, Quebec.

Prior to the deputation waiting upon the Hon. H. Mercier, the new Minister of Lands and Forests, at which it is hoped Sir Lomer Gouin will be present, a meeting of the joint committees is planned to be held, at which the entire subject will be discussed, so that the committee will be able to place before the Government well defined proposals.

How Fire Diminishes Timber in Rockies

In writing up his trip to the West a representative of a leading Toronto paper speaks of the awful ravages of forest fires in British Columbia as follows: A trip through the Rocky Mountains at this time serves to remind the traveller of the appalling waste of a great natural heritage that occurs, with tragic precision, year after year. For the most part the public reads of the devastation being wrought in a certain area, utters a few explosive comments upon our innate prodigality, and forgets about it—while the fire creeps on over the green-groved hill-side, leaving no trace but smoking ruin. I saw one big fire from the train window. It was several thousand feet up the mountain-side, but from the train the flames could be seen licking the very tops of tall trees that succumbed, with startling rapidity, to their fiery roaring onslaught. I have been told by one whose authority is, or should be, beyond question, that thus far this summer fires have destroyed fully five per cent. of the whole Rocky Mountain Forest Reserve. If that be the case (and I believe departmental officials will verify these figures), it is an easy matter for the reader to figure out the probable life of our priceless timbered areas on the Western coast.

Other things than trees are "going up in smoke" this rather ill-nurtured autumn. In its ability to spend money, and to provide for the spending of the money of others, the West has nothing to learn from the "oft-effeted" East. Not in a generation has there been such a passenger traffic as is moving this summer over these Western rails. Helping to restore the balance of an undoubtedly depleted crop, the money of thousands of United States tourists is being thankfully received by Canadian railroads, hotels, summer resorts and cities. I believe that I might say, without the slightest exaggeration, that from 50 to 70 per cent. of the people I meet on the main line trains are from "across the line." By that I do not refer to the ubiquitous American "drummer," who, like the poor, always is with us, and in goodly number. I am thinking solely of tourists—whole families of them, father, mother and four or five children, all "just having a real good time"—as they tell one—spending money, seeing Canada, "getting acquainted."

Gauging Aright Canada's Tree Growth

R. O. Sweezy, of Montreal, writes the "Canada Lumberman" as follows: "In noting your comments on page 86 of the September 1st issue of the 'Canada Lumberman' in regard to the growth of forest trees, I am inclined to think from my experience in the forests of Quebec and other Provinces that your figures do not represent the average growth of spruce and balsam. I quite appreciate the importance of impressing upon the public the fact that trees grow very slowly, but do not let us fool ourselves by under-estimating or under-valuing the assets which we possess. I find the fault of under-estimating is often as much to be deplored as that of over-estimating."

The Crompton Car Co., Limited, with headquarters in Toronto and a capital stock of \$25,000, has been incorporated to manufacture, sell and deal in automobiles, vehicles and automobile parts and accessories. Among the incorporators are M. P. Vandervort and Murray H. Gillam.

Operates His Sawmill by Electricity

Mark Rogers of Parry Sound Says He Finds This Method Preferable to Steam in His Plant

Mark Rogers, of Parry Sound, Ont., is one of the best known lumbermen in that district, and in November last he purchased from Neibergall, Cook & Co., the saw and planing mills in Parry Sound. While these mills are not of large capacity, they are running satisfactorily this season. The sawmill had not been operating for several years but it was December last before Mr. Rogers was able to locate a stock of logs. This season he will have over a million feet of lumber cut as well as 5,000 railway ties. He stocks all kinds of logs. He finds that the planing mill business has been a great help in connection with his activities and during July trade was particularly good. Mr. Rogers makes his own flooring, siding, casings and all kinds of mouldings.

His saw mill is one of the very few electrically operated in Ontario. It is equipped with an inserted tooth Disston circular saw, double edger, trimmers and slash saw. The electric power is supplied by 100 h. p. slip ring C. G. E. motor, which stands up easily under the load. Mr. Rogers states that he finds electricity much more satisfactory than steam power. Parry Sound is building a new dam and power-house this year which will give the industry more current if it is needed.

In the planing mill Mr. Rogers has a three-sided planer and matcher made by Clark, Demill & Co. and a sticker made by the same people. He has also a rip saw and intends to install a resaw in the near future. These machines are driven by a 35 h. p. squirrel cage C. G. E. motor which gives splendid satisfaction. In the summer time Mr. Rogers employs about 25 men, which force is considerably smaller during the winter. He does not operate any camps but buys his logs or has choppers take them out. Two Canadian Northern spurs extend to his mill which facilitate quick delivery. Mr. Rogers handles shingles, flooring, siding, casings, base, sheeting, etc.—practically everything in the lumber and forest products line.

Mr. Rogers has had a rather interesting career, being born at Highgate, Kent Co., in 1881. When very young his parents removed to a farm at Minden, in Haliburton Co. Here among the rugged hills and beautiful lakes he was reared, working hard on the farm in the summer time and attending school in winter. After securing his education he spent six years in the lumbering business—in the bush, on the river and in the sawmill.

At 24 years of age he started back to school again, getting his non-professional first-class teacher's certificate in 1909. The following year he attended the Faculty of Education in Toronto, securing his certificate which entitled him to teach in either public or high schools. He accepted a position on the staff of the Lindsay Collegiate Institute where he remained until 1911 when he resigned and went to Minden where, with his brother, E. A. Rogers, he leased the Minden mills from S. F. Stinson. They conducted a planing and chopping mill for five years and cut about one million feet of lumber annually, doing business under the firm name of Rogers Bros. Their stock consisted of hemlock, basswood, birch, elm, ash and spruce.

In 1916 the subject of this reference bought out E. A. Rogers' holdings but continued a year under the firm name and in 1917 he removed to Huntsville to look after his interests there. Some six years ago, with W. G. Holinshead, as partner, Mr. Rogers purchased about 2,500 acres of timber in Sinclair and Brunel Tps. They built a little mill at Grassmere, six miles from Huntsville, and last year sold out their interest at this point and shortly after Mr. Rogers purchased the saw and planing mills of Neibergall, Cook & Co. in Parry Sound, as already stated and has been doing a thriving and prosperous business.

National Association Extends Work in Canada

The National Hardwood Lumber Association, whose headquarters are in Chicago, is enjoying a gratifying gain in membership. Mr. F. F. Fish, secretary-treasurer of the organization, recently paid a visit to Toronto, Montreal, and Quebec, and as a result fourteen membership applications were secured making the present representation from Canada stand at 39.

The association is extending its scope in the Dominion. It will be remembered that they placed an inspector in the Toronto district in 1911 and the work has grown so that they have two more engaged at present, and their time is entirely occupied in inspecting lumber under the bonded section of the National Hardwood Lumber Association.

It has been decided to place an inspector and open an office in Montreal. Several applications for the position have been received

from inspectors of long experience in the Province of Quebec. The chief inspector of the association visited Montreal during the past month to consider the applications and select the best man fitted for the position, who, in addition to having a thorough knowledge of national railways, must be able to speak French as well as English.

John J. Miller, chief inspector of Toronto, has recently joined the staff of the C. G. Anderson Lumber Co., Toronto, and his successor will be named in a few days. The grading rules of the association have been adopted by practically every other association as being the most perfect for all practical purposes. Uniformity now prevails in the matter of grading rules and inspection. The only difference between the two associations—the National and the American Hardwood Manufacturers' Association—is that in grading rules and inspection the American Association confines the work of its inspection department to the settlement of disputes, while the National organization uses its department in the making of original inspections. That uniformity has been attained in the matter of grading rules which apply to the whole continent is a source of satisfaction in hardwood lumber circles.

The present membership of the association, so far as Canada is concerned, is as follows:

Toronto—C. G. Anderson Lumber Co. Atlantic Lumber Co. Robert Bury & Co. Edward Clark & Sons. Gall Lumber Co. Graves, Bigwood & Co. Hart & McDonagh. Johnston Lumber Co. Wm. Laking Lumber Co. McBean & Verrall. Oliver Lumber Co. Seaman, Kent Co. Pedwell Hardwood Lumber Co. Wilson Lumber Co. Frank H. Harris Lumber Co.

Montreal—Bennett Lumber Co. Geo. C. Goodfellow. E. M. Nicholson & Co. C. A. Spencer. Wm. Rutherford & Sons Co. Henri Peladeau. Eagle Lumber Co. Chas. H. Russell Co. Riordon Pulp & Paper Co. T. Piefontaine & Co. Geo. Kersley.

Quebec—Auger & Sons, Limited. W. & J. Sharples. Roch Julien.

Hamilton—Long Lumber Co.

Collingwood—A. G. McKean.

Huntsville—Muskoka Wood Mfg. Co. M. Martin.

Midland—Midland Woodworkers.

Owen Sound—John Harrison & Sons Co. Keenan Bros.

Warton—Geddes-Tyson Lumber Co.

Great Pulpwood Activities of Laurentide

Work in the logging department of the Laurentide Co., Grand Mere, P.Q., has been commenced. The company will this year operate twenty camps. There will be about a thousand men in these company camps. The rate of pay is \$60 to \$70 per month, with board, and a 10 per cent. bonus to every man who remains on the job for three months.

The department has had a great many applications from contractors, and will have no difficulty in securing the necessary cut. In all, about four thousand men and a thousand horses will be engaged in getting out wood for the Laurentide mill during the winter.

An innovation this year was the creation of a new district by the division of the old La Tuque District. This new district, the Ribbon River district, with headquarters at La Tuque, will be in charge of E. M. McLaren. The Mattawin district will be under B. C. McLaren, and St. Maurice under B. L. Butler. La Tuque district will be under B. L. Baxter, who was formerly a member of the logging office at Grand Mere.

Returned Soldiers Take Forestry Posts

S. M. Ritchie of Temple, N.B., a returned soldier and a scaler of some experience, has accepted the position of forest ranger for Albert Co. with headquarters at Hillsborough.

E. H. Lewis, a returned soldier, of Hillsborough, Albert Co., has secured a post as scaler's helper.

H. C. Lynn, of Campbellton, another returned soldier, has taken a position as forest ranger in Restigouche County. He will make his headquarters at Kedgwick and have charge of District No. 4.

Harvey Malcolm, of Flat Lands, Restigouche Co., also a returned soldier, has been appointed forest ranger in District No. 7, Restigouche County. His district will cover the watershed of the South East Upsalquitch River.

Britain Should Revert to Wooden Houses

In a recent editorial the Daily Mail, of London, Eng., says that as Britain has not got 335 million pounds to spend on the housing scheme, Britishers will have to go back to the simpler things. Thousands, it states, live in wooden houses in America, and they were common houses in England in old times. By using the material in hand in wooden huts the people will get good housing and pay their way while the taxpayer will be relieved.

River Drivers Must Complete Work

Cannot Quit in Midst of Operation and Collect Full Wages,
According to Recent Decision in Quebec

It has been decided by the courts in Quebec city that river drivers who contract to do certain work for the season cannot "jump their jobs" and collect full pay from their employers.

An important suit was tried before Chief Justice Sir F. X. Lemieux, in the Circuit Court, Quebec city, on Sept. 22, when seven river drivers entered action against the St. Anne Power Co. of Beupre, Que., to recover alleged arrears of wages. Judgment was delivered in favor of the defendant company.

The particulars of the case are that the men (who were the plaintiffs in the action) were engaged to drive logs last spring for the St. Anne Power Co. and were to be paid \$3.00 per day and the company paid them off at \$2.50 per day.

The St. Anne Power Co. admitted that these men were employed at \$3.00 per day, but stated that they did not finish the drive. They remained only 25 days and left without cause; consequently, by their course, the company did not complete the drive on the stream that these men were working on and the company was put to considerable expense and caused damage.

In delivering judgment in favor of the St. Anne Power Co. Chief Justice Lemieux spoke, in part, as follows:

His sympathy was with the laborer, but in future he would have to put that aside, for we had arrived at a time that all would have to be firmer with the laborer. The lumber industry was one of the principal industries in the province and the lumberman had as much right to protection as the employee. In this case these men left at a critical time for no reason whatever. Lumber companies were paying high wages and feeding the men well, and the men, in turn, had to give value for the amount they were paid; also that the young men in the country were worse than the young men in the city, in that they imagined that they were going to do as they pleased and work for a short time only, no matter what inconvenience they might cause a company. When they go on a drive they are supposed to remain until it is finished as it is only at a certain time in the spring that the logs can be conveniently floated. These men did not earn \$1.00 a day for the company, therefore the Chief Justice stated he would dismiss the action with costs against the plaintiffs.

Valets and Private Secretaries for Lumberjacks?

Fear that the lumberjacks of Thompson Sound district might next ask the company to provide them with valets and private secretaries perhaps helped W. H. Higgins, one of British Columbia's oldest logging operators, to decide to close down the camps of Higgins & Company.

Mr. Higgins is 89 years of age and has bossed gangs of men in the woods in various parts of the North American Continent since 1847. He is, in spite of his years, physically fit and mentally alert.

"But I am a bit old fashioned may be," said the sturdy old Canadian, when he told friends recently in Vancouver of the circumstances leading to closing down the camp at Thompson Sound and putting the keys thereof in his pocket. "I for one cannot stand for the fanaticism which is sweeping the country and disturbing industry.

"I did not mind when the men gathered at the bunkhouse and organized a debating society. That was very well, and they had their meetings under a proper chairman and with parliamentary rules governing the proceedings. But organizers came to me and demanded that we install both shower and plunge baths, a change of sheets every day, brass bedsteads, box springs and hair mattresses for each man—well, that was going a bit too far.

"Soon we would have had to add other luxuries if we met such unusual demands," continued the veteran logger. He denied that the men had also applied to have tea and toast served to them in bed before undertaking the day's exercise in the sylvan glades of the North.

"But they desire to ape millionaires," said Mr. Higgins, with some heat, "and for my part I am through until this fanaticism

passes. There is only one thing that I can do and that is to pay off all hands, and if they can live until we can reach a more sensible basis, I am sure I can."

Among the men at Mr. Higgins' camp were workers who had been engaged under him for many years. The cook had served with him for eleven years, he said, and one old New Brunswicker had worked with him for forty-five years. Some other men had been with him for from four to ten years. But the men who had carried on the agitation, which resulted in the closing of the camp, were newcomers.

"Well do I remember," said Capt. Higgins, "when we worked in the camps of New Brunswick for \$9 a month. We used to spend the nights in a great big bunkhouse with a roaring fire in the middle of the room. One of the boys would fiddle and others would sing or dance or tell stories. We were happy in those days and worked hard all winter, and in the spring we would drive the rivers. We had salt pork and potatoes and Porto Rico molasses but not such a thing as sugar. In those days there was none of this high-sounding talk about proletariat dictatorship and such nonsense. And those camps produced the best men in Canada."

Mr. Higgins is apparently unable to solve present-day labor problems. But in his thirty-five years in the British Columbia forests he has solved many other problems. In the old days the man who "ran" the camp was the man who drove the oxen. The teamster, usually a profane and wicked co-worker, had the power of life and death over the day's work. Oldtimers will tell how the driver of oxen might sulk in his tent if a drizzle of rain appeared in the morning or might provide a partial holiday for all hands in the camp if one of his sturdy beasts suffered a scalded shoulder during the day.

It was this veteran who is credited with having first introduced the idea of steam power in logging operations, a departure which robbed the driver of oxen of his job for all time.

"Yes," said the logger, when he had paid his compliments further to the organizers who are spreading their propaganda among the lumber camps of the province, "I believe that I first introduced steam in logging. I did it to beat the oxen teamster, who was boss of the works always, until we got rid of him. We first tried steam on the side hills and the concentrated power worked splendidly. The late John Hendry was one of the first to recognize its merits."

"But let me say this," said he. "The lumber industry today can not see far into the future and is as uncertain as to what is before as during the war days. Labor unrest is the chief factor contributing to this condition. Unreasonable and unnecessary demands on the part of labor will mean that many a man in the business will be compelled to do as I have done—close down the camp and pay off the men and wait until there is a fair chance for all concerned. And I know that this will mean employment and all that goes therewith, but only suffering of some sort will bring about natural and normal relations in the industry between employer and employee."

Mr. Higgins worked for many years with the late James Ross, of Quebec, and the late James MacLaren, of Ottawa, in logging enterprises of various kinds. It was during the war that he created a record in outstanding accomplishments when in a serious emergency he rallied 800 men to a spruce camp in the Queen Charlotte Islands and organized them to carry out operations under the direction of the Imperial Munitions Board.

Cedars of Lebanon Made at Creation

The famous cedars of Lebanon, tradition says, were planted by God at the creation of the world and that they will endure until the last day. That there was a great grove of cedars of Lebanon in the days of King Solomon there can be no doubt, as it was from them that he obtained the wood for building the temple.

At the present day the grove contains 389 trees, of which only 15 are of large size. It is the centre of a great basin in the mountains 6,000 feet above the sea.

Mr. Booth Busy As Ever At 93

In the centre of the accompanying illustration is seen Mr. J. R. Booth, of Ottawa, Canada's oldest lumberman, who is now in his 93rd year and works harder and longer each succeeding month than he did the previous one.

Surrounding Mr. Booth are members of the Grenadier Guards Band, of London, England, who recently gave a concert in Ottawa and filled a two weeks' engagement at the Canadian National Exhibition, Toronto.

A rather interesting story is linked up with the taking of this picture. J. S. Knapman, of Toronto, purchasing agent of the McDonald Lumber Co., Toronto, happened to be in Ottawa during the engagement of the famous band. He was sitting in the rotunda of

J. R. Booth making a tour of his sawmill and other industries at Ottawa, in company with several members of the Grenadier Guards Band

the hotel when he overheard some of "the boys" remark that they would like to visit the industries at the Chaudiere.

"Would you care to see one of the largest operations in lumber, pulp and paper that there is in the British Empire?" inquired Mr. Knapman.

The musicians replied it would be a great pleasure and privilege for them. Accordingly Mr. Knapman called upon Mr. C. Jackson Booth and obtained the necessary permit for the men to be shown the teeming industrial activities of Mr. Booth at the Chaudiere Falls. As they were going through the plant they found Canada's veteran lumberman near a circular saw in the mill supervising the cutting up of an unusually large pine log. As Mr. Knapman entered the mill, Mr. J. R. Booth shook hands with him, saying: "Come over to the light, I want to see who you are," it being rather dark in the place where the "lumber king" was standing. As soon as they took a few steps, Mr. Booth mentioning the name of his visitor, remarked: "Yes, it is just twelve years since you used to come around here. You bought a good many thousand poles from me for the Bell Telephone Company, and I have not seen you since you went out of that business."

That a man of Mr. Booth's busy life and many important interests should recall the incident after a lapse of so many years shows what a remarkable keen and retentive memory he possesses.

Mr. Booth took particular delight in conducting the visiting bandsmen over the plant. The official photographer of the renowned musical organization being in the party, it was suggested that he secure a snapshot of Canada's most widely known lumberman, and that the picture is a good one all will readily acknowledge. Mr. Booth is never so happy as when supervising the many operations in connection with his mammoth enterprises in the Capital. It was said of him by a friend the other day that "the older he grows the more active he is."

Lumber Activities at Trout Creek

W. S. Kelly, manager of the Ballantyne Lumber Co. of Trout Creek, Ont., was in Toronto recently. The company have been busy shipping out white pine and spruce lumber during the past season and out of a stock of 2½ millions have only one-quarter million yet to dispose of. They still have logs that will make about 300,000 ft. of lumber and these will be sawn in the spring.

Mr. Kelly reports that the Dominion Wood and Lumber Co. of Trout Creek will shortly put in operation their chemical plant which has been closed down for some time. This plant turns out acetate of lime, charcoal, alcohol, etc., from maple and birch. The sawmill of the Dominion Wood and Lumber Co. was operated for some months this spring and the company are now repairing and putting in good shape their ten miles of railway which extends from Trout Creek east

through the limits of the company who several months ago acquired the holdings of Trussler Bros. in Laurier Tp.

The Ballantyne Lumber Co. whose limits are in Ballantyne township in Northern Ontario have been shipping lumber during the past season to the Old Country, United States, Toronto and other Ontario points.

New Industry for Fort Frances

It is expected that a new industry in the shape of an insulite mill with a daily capacity of 50,000 feet will be launched in Fort Frances. The enterprise is likely to go ahead as soon as certain arrangements can be made concerning timber limits and waterpower. E. W. Backus is at the head of the new organization and the company is asking large limits from the Government and other concessions, the limits to include the territory drained by the Rainy Lake and its tributaries. The power has to be arranged for with the Minister of Public Works, who has intimated that no work will be done on Long Sault Rapids this year, the place from which the power is to be developed.

Pest Needs to be Stamped Out

John D. Tothill, who is in charge of the natural control investigation to make a number of trips into the woods this autumn and the red from an investigation of the spruce budworm, which has been doing such damage to the balsam fir and also some of the spruce trees in New Brunswick, states that this bud worm question has become one of the most serious of the day. Mr. Tothill adds that one of the main things needed at the present time is publicity in regard to the depredations of the voracious pest. He is planning to make a number of trips into the woods this autumn and the results of his investigation will be followed with interest.

Lumberman Nominated for the Legislature

R. S. Potter, head of the R. S. Potter Lumber Co., Limited, Matheson, Ont., who has been nominated by the Conservative party as their standard bearer for the constituency of Cochrane at the forthcoming Provincial election, is a widely known resident of the North where he has lived for many years. Mr. Cochrane first went to New Ontario in 1898 as a time-keeper in a lumper camp for J. R. Booth, of Ottawa, who was then operating at Haileybury. He spent two years at that work and then embarked into the prospecting and mining game, at which he passed most of his time until about four years ago when he re-entered the lumber arena. Mr. Potter, who is, as already stated, president of the R. S. Potter Lumber Co., has always taken a leading part in the development and expansion of New Ontario and has a wide circle of friends. The mill of his company is situated three miles north of Matheson, on the Watabeg River, mileage 208 on the T. & N. O. Ry. The lumber of the company consists mostly of jack pine and spruce. A large quantity of jack pine railway ties is turned out at the mill which has been very busy during the past season.

R. S. Potter, Matheson, Ont.

Little Foundation for Wide Report

Gillies Bros., who recently disposed of their plant in Morristown, N. Y., state that they cannot say what ultimate use will be made of the property. As to the probability of a large paper mill being erected there by Wm. Randolph Hearst, of New York, they are of the opinion that this is only a newspaper report. Gillies Bros. have not been using the property at Morristown for some years but have their own salesmen in northern New York district and distribute direct from their mill at Braeside, Ont.

Canadian Firm's Bow to British Trade

The September 6 issue of the Timber Trades Journal, of London, Eng., contains a full page advertisement of Terry & Gordon, Toronto, with cuts of the members of the firm. The announcement is inserted by their agents in Great Britain, Spencer, Lock & Co., 27 Clements Lane, London.

Mr Dunlop Once More Nominated

Edward A. Dunlop, M.L.A.
Pembroke, Ont.

After the completion of four successive terms in the Ontario legislature E. A. Dunlop has again been nominated by the Conservative Association as its standard bearer in North Renfrew. There were a large number of women delegates at the convention who participated freely in the discussion and the business and Mr. Dunlop was accorded the nomination by a large majority over the only other nominee, which is a tribute to his personal popularity and the measure of esteem which he enjoys particularly among the fair sex of the riding. As is generally known, he has never met with defeat at the polls and he is always a welcome visitor to every lumbermen's gathering.

Mr. Dunlop is president of the Pembroke Lumber Company; a director of the Massey Lumber Company and vice-president of the Thos. Pink Company, Pembroke, manufacturers of lumbermen's tools. He is also brought in close contact with the lumbering business by reason of being president of Dunlop & Co. who specialize in hardware and cookery requirements for logging operations. Mr. Dunlop is associated with a number of other important organizations and is a former director of the Canadian Lumbermen's Association. Previous to entering upon his career in the Legislature he served in an aldermanic capacity in Pembroke for a number of years. One of the youngest members in the Ontario Legislature he will this month celebrate his 43rd birthday. His father, the late Arunah Dunlop, who passed away in 1892, represented North Renfrew in the Ontario Legislature at the time of his death and his son has proved a worthy successor.

Death of New Brunswick Lumberman

Daniel E. Richards, president of the Richards Mfg. Co., Campbellton, died recently. He was one of the best known lumbermen in New Brunswick and in business circles was highly esteemed. He was 53 years of age, and some seven years ago when the Richards Mfg. Co. was organized he was elected president and carried on his duties until last spring when he was taken ill. He consulted many specialists in the hope of regaining his health and for a while appeared to be improving. Early last month his condition became serious and he gradually grew worse. The deceased was a son of the late Mr. and Mrs. David Richards, of Campbellton, and is survived by his wife, two sons and two daughters.

Progressive Lumber Co. Secures Charter

J. P. Abel, Fortin & Co., Limited, were recently incorporated and granted a charter to manufacture and deal in lumber and timber of all kinds and also to operate saw mills, box factories and to produce any articles made of wood. The new company have been empowered to acquire the property and assets of the business conducted in Montreal by J. P. Abel, Fortin & Co., box manufacturers and lumber dealers.

The incorporators are A. E. Fortin, Ernest Abel, Alphonse A. Paul, Ph. Trottier and J. H. Berard. The new company are capitalized at \$200,000 and make a specialty of hardwood flooring. They also manufacture wooden boxes and excelsior and their place of business is at 379 Desjardins Ave., (Maisonnette), Montreal, Que.

Hall Bros. in Larger Quarters

Hall Bros., Limited, wholesale lumber dealers, who recently removed their offices from 174 Mutual Street to 300 Crown Office Bldg., corner Queen and Victoria Streets, Toronto, where they have more convenient and commodious quarters, report business as being particularly active at the present time. The members of the firm are S. E. Hall, J. M. Hall and T. G. Hall, and they carry on extensive operations in all kinds of hardwoods. They own and operate a sawmill at Marlbank, Ont., where they cut mixed hardwoods and hemlock. They also furnish stock to several mills in the interest of their customers and operate a number of camps in Hastings County each winter. S. E. Hall is president and general manager of the company; J. M. is first vice-president and T. G. second vice-president.

Hall Bros. come of a family that has long been connected with lumber and timber, their father, the late Samuel Hall, being engaged

in this line all his life. He carried on a square timber business throughout the white oak regions of the south and later operated a mill at Marimon, in Grey County, and then removed to Keady. His sons have had a practical insight from the logging to the distribution end. S. E. Hall, president of the company, after leaving home some fourteen years ago, was engaged for a considerable period with the Bradley Lumber Company, Hamilton. In 1908 he came to Toronto and launched out for himself, where he was afterwards joined by his brothers. During the war they did a large trade in supplying ship timbers and specialized in round and hewn stock, taking out large quantities of rock elm. The firm will ship this month to the Old Country five hundred sticks of rock elm taken out some fifty miles northwest of Toronto.

The Bolinder Crude Oil Engine

The "Canada Lumberman" has received from Swedish Steel & Importing Co., Ltd., of Montreal, who are Canadian representatives of the Bolinder Co. of Stockholm, Sweden, an attractive and elaborate catalogue, illustrating the Bolinder heavy crude oil marine engine and vessels equipped with the same. Varied and extensive use is being made of the crude oil engine. The Bolinder engine propels not only smaller craft, but also full-powered, ocean-going cargo carriers of four to five thousand tons capacity. It is predicted that this simple and economical internal combustion engine will prove a serious competitor to steam for propulsive powers.

Of special interest are a number of west coast vessels constructed particularly for the lumber carrying trade. Some of these are full-powered motorships, equipped with 640 B.H.P. engines, while others are auxiliary sailing vessels of 2,200 to 3,500 tons D.W., equipped with 320 to 640 B.H.P. engines. Other classes of vessels of interest to the lumberman are the oil-engined tow boats and the self-propelling barges. Of the latter class, especially, Great Britain seems to have a large number.

The aerial propelled barge is another kind of craft, which has been found unexcelled for passage in very shallow or weedy waters, where a marine propeller is impracticable. It is claimed that this novel type of boat has proved highly satisfactory.

Many will probably be surprised to learn that quite a number of vessels in the British Navy are oil-engined. The British Admiralty ordered during the war not less than about 300 Bolinder engines. A number of Bolinder-engined motor-monitors were launched in 1915, and they have since done excellent work in many waters.

Mr. Miller Joins Toronto Lumber Firm

Mr. Miller Joins Toronto Lumber Firm

John J. Miller, of Toronto, who has been appointed manager of the hardwood department of the C. G. Anderson Lumber Co., and has entered upon his new duties, is favorably known to the lumbering trade throughout Ontario. Mr. Miller has handled all ends of the business except the sawing, chopping and peeling of bark. He started his career with Wilson, Godfrey & Co., 63 Wall St., New York. Their yard was in Brooklyn, and after some time in the service they sent him on the road, buying and inspecting. He was with them ten years and covered the eastern section from Maine to Pennsylvania. Mr. Miller was next with H. H. Salmon & Co., 88 Wall St., New York, for some nine years, spending

the major portion of the time in the south, looking after the territory from West Virginia to Louisiana. He thus got to know all the leading lumber dealers in the east and south, and was next associated with W. T. Hubbard, Toledo, Ohio. After being two years there he made application for a position as inspector on the staff of the National Hardwood Lumber Association, and passed the examination, part of which was on Mr. Hubbard's yards. Mr. Miller worked in the Detroit territory for about a year and then assisted in different markets. From the Buffalo market he came to Toronto, in 1910, where he has since carried out his duties as a faithful and earnest member of the inspecting staff of the National Hardwood Lumber Association.

Down the Arbor Walk to the Works

The accompanying picture shows a fine avenue of hardy Norway Maples on both sides of the long approach to the fifty-acre factory of Henry Disston & Sons, Inc., Philadelphia. The trees were planted some twenty-three years ago.

One of the long-time employes of the firm, when viewing this photograph, remarked: "Well, do I remember the old walk, and four times a day for many years I trod the path along with thousands of fellow-workers. It was of cinders, and in the summer this long, wide, deep bed of cinders seemed to absorb the sun's hot rays and

Rows of Norway Maples planted twenty-three years ago

throw them out with redoubled vigor as you walked along. The improvement is a lasting and beautiful memorial to the thoughtfulness of Samuel Disston, whom all the boys called 'Uncle,' for reaching the shade of the wide-spreading branches of the maple trees one enjoys the cool, delightful stroll along the smooth cement pavement to the entrance of the works."

It is peculiarly interesting and seemingly contrary that Disston, whose saws for years have been used in denuding many thousands upon thousands of acres of timber, should be planting, growing and preserving beautiful shade trees. Manufacturing plants in out-laying districts and municipalities may well take note of this as an example which will bear emulating.

Has Export Trade Been Overloaded?

The expected has happened. It was inevitable, judging from past experience.

The armistice had hardly been signed last fall when it at once became evident that a phenomenally large number of people were preparing to enter the lumber export business, a rather hazardous game at any time for those without experience and not even a hazard but substantially a sure-thing loss under the cataclysmal conditions for those without experience, says the "New York Lumber Trade Journal."

But did they know that or did it deter them if they did know? They did not, or it did not.

Being located in what is now probably the largest export and import market in the world, this paper, as soon as the armistice was signed, began to get all sorts of inquiries from would-be lumber exporters, many of whom obviously did not know the first rudiments or principles of the business, nor could they possibly command the means to that end. It was just a burning desire that obsessed them, as was perhaps but natural in the premises, to share in the phenomenal profits that by hearsay were presently to be realized in the export lumber business. The whole idea would have been comical had it not held so much that was obviously dangerous to all sound lumber business as well as to many, if not most of the newcomers, themselves. We regretfully so told some of them when we were able to get that far along with them in the discussion. But did they listen? They mostly did not. But probably and even obviously in some cases they attributed it to prejudice on our part.

A very few of the newcomers had a substantial foundation of the right character of lumber stocks, or at least a modicum of export lumber experience, or both, on which to trade. But the great mass of them were equipped apparently for this intricate export business only by more or less hazy knowledge or hearsay that big money was to

be made therein and a burning desire as indicated to share in the golden opportunity with or without experience or perhaps even needed capacity to acquire it, and without even immediate availability of stocks. Later, when a tentative tour of some of the shrewdest wholesalers of the industry developed the undoubted fact that the much-heralded opportunities, on investigation, were for one cause or another mostly thin or hot air, even then these other would-be exporters were unterrified, but have rushed into what shrewder, more experienced heads were not willing to undertake.

Now comes the inevitable aftermath. There are numerous news items and personal comments from those in the know concerning the unsatisfactory lumber conditions abroad already. Where possible buyers abroad are not, as far as plants are concerned, physically as well as financially exhausted, or well nigh so, but even now ready to trade, word presently comes that they are "visiting to trade on concessions" for stock accumulated on consignment, as applied mostly to hardwoods. Oak has been very largely shipped even as compared with before the war. Oak and other hardwoods out of Baltimore, for example, we understand, constitute about two-thirds of the entire shipments, as borne out by the fact that the whole lumber list on the other side is a short one, and many other items are not at all represented in these consignments. High charges for storage bring such consignments out at a loss unless prompt and early absorptions on arrival have been provided for in advance. So nothing could be more foolish and futile than free consignments as such on a chance of getting orders on arrival. It would be well for the industry at large on both sides of the water, and especially for such consignors themselves, if they would consult such of the appointed means to the same end as, for example, the new overseas forwarding agency at Memphis, etc., before hasty action. It would not only redound to the interest of the industry at large, but would be money in their own pockets in the long run, even though the business were not alone quite so direct. In other words the consignment evil was perhaps never more an evil than now, from every point of view.

This subject matter perforce has been substantially a leading editorial at least about once a year for the last several decades in perhaps every standard lumber paper, and not by choice but by thrusting itself into view. Only, as indicated, this time the conditions seem worse than ever. So it may be added once again that the dangers of lumber exporting without right lines of experience as well as adequate available stocks, were never greater and soon or late, usually soon, are more than apt to spell disaster.

An Attractive Publication on "Belting"

The Main Belting Company of Canada, 10 St. Peter Street, Montreal, have just issued a most complete, attractive and comprehensive publication setting forth the quality and merits of Leviathan and Anaconda belting. The illustrations, art work and letter press are decidedly pleasing, and the volume of 144 pages contains a mine of information with regard to power transmission, solution of modern belt problems, table of horse-power transmitted by various thicknesses of belts, belting in pulp and paper mills, rolling mill work, motor drives, machine shops, Canadian furniture factories, and other industries. Admirable illustrations are given of the Leviathan, which is a general purpose belting possessing extraordinary strength, toughness and flexibility and Anaconda belting, which is basically the same as Leviathan and possesses all the qualities which enable the latter to give highly satisfactory service, whether the problem be one of transmission, elevating or conveying.

A number of striking pictures are presented showing the strength, durability, economy, efficiency, etc., of the products of the Main Belting Co. of Canada. Users of belts in any form will find in the new publication, entitled "Belting," a valuable and convenient work of reference. An index is given which readily indicates where the data on any power problems may be found. Special pages are devoted to the capacity of belt, elevators, centrifugal belt elevators, continuous belt elevators, etc., while timely particulars are furnished with respect to belt dressings, belt fasteners, clinching hooks, steel belt lacing, belt punches, cutting pliers, etc.

The new publication is so arranged that any additional printed matter issued by the Main Belting Company can be added by unloosening two or three paper fasteners which bind the book firmly and, like a loose-leaf ledger, afford every facility for extension.

A total of 19,776,814 feet of lumber was shipped from British Columbia ports in August. Nearly seven and a half million feet was shipped on French vessels during the month. All these ships are being handled by the C. Gardner Johnson Agency, Vancouver. As soon as they are accepted by the Bureau Veritas and the French high commission the agency sends them to different mills to load. Nine of these wooden steamships, with a total tonnage of 18,900 d.w. tons, went to sea during the month, and it is expected that considerably more will be despatched in September.

A Good Word for the Wholesaler

We hold no brief for the wholesaler. He's human, and he wants to get rich. We have a hunch that he has not been nor is he at present always above getting something for nothing when the opportunity presents itself. But the retailer who is without sin, let him cast the first stone! The wholesaler has his troubles and his weak spots; he isn't any saint, not if we know what a saint is. But he is offering us a vital

kind of service, and in more than one instance he has looked out for our interests. Of course, he did this mainly because his own interests depended upon the conserving of ours, but none the less he has done us good service; and the future of the business, the interests of wholesaler and retailer and customer, depend upon our having a good human understanding of each other so that we can fit our work into the whole fabric of lumber handling in such a way as to cut out the most waste and the most lost motion and the most useless expense. We're not going to get anywhere in realizing the full possibilities of business by looking exclusively to our own little corner. The man who does that is likely to have the experience of the amateur carpenter who was building a hen house. He got so interested in lining it up that the first thing he knew he had himself nailed in with no doors nor windows from which he could emerge. — American Lumberman.

On Last Quarter of Their Shipbuilding Contract

With the launching of the Wilfrid Laurier on August 23, the Foundation Company of B. C., Limited, completed three-quarters of its contract for twenty 3,000-ton wooden steamships to be built at Victoria for the French Government. As a result, three ways at the time of writing are empty, and are not likely to be filled again unless the company manages to secure further contracts.

The La Salle, the fourteenth ship of the contract to take the water, was launched from the Point Ellis Yard of the Foundation Company on August 14.

Trials of several of the Foundation ships made recently have upheld the reputation of the local yards. The Ontario, which was tried out on August 1, averaged 12.38 knots, while the Ottawa registered 12.56 knots. The Ottawa was the second ship of the contract powered with engines built by the Victoria firm of Hutchison Brothers. The Winnipeg, the other ship so powered, averaged 13.52 knots. The Canada was tried out on August 28, and averaged 12.13 knots, exceeding its contract speed by 1.13 knots. Fuel tests made during the trial run showed that the Canada burned 16 tons during twenty-four hours.

Lumber Company Will Have Switch Line Installed

To facilitate the loading of its lumber shipments to eastern Canada and the United States, the Moore-Whittington Lumber Co. is making arrangements with the Canadian National Railway whereby it will have a switch line of its own on the new terminals

which are being established on the old Indian Reserve.

At present lumber from the Moore-Whittington mill has been carted in wagons to the Esquimalt and Nanaimo line, which is a considerable distance away, or to the old terminal of the C.N.R. When the new C. N. R. terminal is established, however, it will be necessary to cart the lumber only across the Point Ellis bridge and on to the Reserve, a short haul. Here the company will have a siding of its own where it can load into freight cars. The lumber will be shipped, of course, to Patricia Bay, whence it will be ferried to the mainland and on to the C. N. R. transcontinental system. Officials of the mill have conferred with officials of the railway company and they feel that the C. N. R. is out to get the lumberman's business.

Worst Forest Fires for the Last Nine Years

After a 750 mile trip through the Interior on horse back, M. A. Grainger, Chief Provincial Forester and head of the Forest Branch, returned to his desk at the Parliament Buildings late in August. Mr. Grainger started from Vancouver and proceeded eastward, spending five weeks in travelling the Hope to Princeton Trail, through the Douglas Lake country and various other points in the Interior. Later he headed north and rode into the North Thompson country. His mission was not so much in connection with forestry work as in looking over grazing areas and sizing up crop conditions. While it had undoubtedly been a very bad year in many localities, Mr. Grainger found that the crops were, generally speaking, not as bad as he had anticipated. Forest fires in the Kootenay country, he stated, had been probably worse than in any year since 1910.

Plans whereby British Columbia forest products will be exhibited in different points in the United Kingdom are being promoted by the provincial authorities. The exhibition will include samples of timber, lumber, farm produce, fruits, minerals, etc. The Department of Agriculture, which is collecting the exhibit, is informed by Agent General F. C. Wade, K.C., that arrangements for the display of the exhibit can be made through the Victoria League of Great Britain, an organization which conducts lectures and exhibitions to show people in the Old Country the inducements for settlement offered by different parts of the Empire. The exhibit will be just as complete as it is possible to make it, and it will be replenished regularly with new articles as they are required.

Review of Current Trade Conditions

Ontario

Business in the lumber line continues brisk although some wholesalers report a shortening up in requisitions during the past week. All the lumber companies are preparing to undertake logging operations on a scale that has outclassed anything in that direction since the outbreak of the war. Some firms have doubted the number of their camps and the limit of their logging operations is only restricted by the forces of men available. The demand for lumber of all kinds is good particularly in the west and north and it is interesting to note the predictions that are made in various quarters. One wholesaler remarked recently that lumber would not only be scarce within the next six months but that there would be a regular famine in a number of lines, while the sales manager of another concern stated that they had the largest order book filled out that had ever been known in the history of the firm.

In the retail yards there is a considerable movement of stock and not a few lines are depleted. Many dealers have allowed their grades to run low and are getting anxious about obtaining fresh supplies. Shipments in some cases are reported rather uncertain owing to car delays at certain points. The mills report that wholesalers are looking up stocks of white pine to replace those which they have recently disposed of but that they find it difficult to lay hands on any large blocks.

Hemlock is very scarce and there is an excellent demand for this lumber in house construction. In hardwood there is a decided shortage of the thicker ends of birch and elm. The makers of hardwood flooring are using all the thinner stuff that they can possibly get their hands on in order to satisfy the demand of construction companies, house builders and contractors for all kinds of structures. Furniture factories are rushed at present and there has been many buyers from automobile concerns across the border visiting Ontario in search of birch. The prospects for business this fall are particularly bright and the country is being scoured for many lines of hardwood.

In British Columbia stocks trade is rather quiet and no one is in a position to predict what shape matters will take. There has been a slight easing up in the price of shingles but this always occurs in the fall of the year owing to the diminished demand. Laths are practically off the market. It is predicted that the base price of B. C. timbers will take an advance of from \$4 to \$5 owing to the large export trade which has been done from the Pacific Coast province. There has been a pretty active call for timbers for some time and it is felt that there may be a scarcity of them in the near future.

In Toronto it is expected that the number of brick dwellings erected in 1919 will exceed the total number of erections for 1916-17-18. To September 15th there have been 1,843 constructions and they total \$700,000.

"There has been an increase of 125 per cent. in the erection of brick dwellings this year," stated an official.

There is comparatively little southern pine coming in at the present time except 2 x 4, which is used for studding. There is, however, a fair importation of chestnut, gum and cypress. A large quantity of the former is being used for interior trim in houses and comes in in No. 1 common & better in 1 and 1½ inch. There is a fair quantity of cypress being imported in shop and better and this material is used for tank work and some sash and door construction. Gum is commanding a decidedly high price, the prevailing figure for 1st and 2nds being around \$110, exclusive of duty and exchange. Chestnut in 1st and 2nds in 1½ inch is bringing \$105 and in 1 inch \$100, with values constantly stiffening. In most all southern woods, the supply is far short of the demand and, while there has been a scarcity of labor, there was until recently no strikes, but during the past few days some mills in the south have had trouble in this direction which all adds to the gravity of the situation.

Great Britain

Conditions abroad are comprehensively reviewed in an interview which appears in another column with A. C. Manbert, of Toronto, lumber commissioner, from Ontario, who recently returned from overseas. English trade journals bear out exactly what he says in regard to tonnage outlook and port congestion.

There is still great difficulty experienced in getting tonnage for timber cargoes. Business with Canada and America is more or less at a standstill for this reason. There is only a poor chance of getting

shippers to make quotations on a c.i.f. basis, and, on the other hand, buyers are by no means ready to make purchases on free-on-board lines. There is a deadlock, therefore, and the position unfortunately is not likely to improve until more tonnage becomes available. A lot of steamers are still being used in connection with the war, and it will be some time before they are set free for commercial purposes. Some shipbuilding is going on, it is true, though a good lot of speeding up is also required in this direction.

Business is fairly good and the market is firm so far as American hardwoods are concerned. There is still considerable delays in obtaining parcels of timber arriving in the Port. The congestion at the docks has now reached enormous proportions, and many week's delay often occurs before timber can be got out of the incoming vessel. There are now some indications that these delays will be modified in the near future, through the introduction of motor lorries to clear away the essential imports, such as foodstuffs and perishable goods, which under ordinary circumstances, have preference over timber and cotton, etc. In the meantime, the demand for all kinds of hardwoods is growing stronger week by week. The supplies coming forward are on a considerable scale, especially plain oak; there appears to be an abundance offering on the market. With regard to quartered oak, this is extremely scarce, and some difficulty is experienced in obtaining anything approaching moderate quantities at the moment. Red gum and sap gum are to be obtained in fair quantities, so that the market generally is in a healthy state.

In regard to the unberthed ships at Liverpool the Timber Trades Journal says:

What has really happened is that since the armistice our shipping has increased far more rapidly than has the inland distributing power of the country, and we have now come to the point where twelve or fifteen large ships are waiting berths at London, and fifty at Liverpool. That is absolute waste of ship-carrying power, as merely bringing a cargo into a port is useless unless it can be distributed. The solution lies in making the most of the existing facilities and in supplementing them. We are putting forward proposals with regard to the possibility of increasing facilities for road transport. The establishment of a mobile fleet of lorries capable of carrying goods for distribution over short distances was undertaken some time ago, and numbers of lorries have been working quite successfully, while we have had put at our disposal a certain number of battalions of the transport workers for the purpose of supplementing proved deficiencies. The idea is not to compete with civilian labor, and we have the cordial support of labor and of the employers. These men have put in six million days' work, and they have shifted 27,000,000 tons weight of stuff to prevent blocks arising in the docks.

The Government Buyer has promised, or threatened, that very large shipments from Canada will be made this autumn. There is now rather more sign of his activities. All the pine that has been shipped could have been sold over and over again, and there is not the least fear of any scarcity of this particular wood. But with regard to spruce the case is rather different. Spruce competes with Swedish and Finnish productions, and although most of the Scandinavian shipments have come to the East Coast, it has often been possible hitherto to send the wood across the country at a profit, owing to the bare state of the importers' yards on the South and West Coast. With the advent of more spruce cargoes this trade will either cease or gradually diminish. At the present time, the prices for good average specifications of spruce are about £34 or £34 10s. c.i.f. to the West Coast, a much cheaper figure than that at which the East Coast importers can supply Swedish whitewood. It need scarcely be pointed out that the volume of spruce shipments during the next couple of months will have a very strong effect on the prices of Scandinavian wood, and the fear of a rush of cargoes is undoubtedly making all business rather slow and difficult. Probably the Government Buyer wishes to reduce the price of timber—it will be to his credit with the authorities if he can do so—but if his intention is to flood the country with spruce he will merely congest our ports, find himself unable to sell the wood promptly, and bring about a state of confusion. In a falling market, merchants are always very shy of purchasing; and if in the present circumstances values begin to fall no one can predict the result. The Government methods of dealing with the hardwood trade at the beginning of the year will not soon be forgotten. The market was a falling one, and the Government's experiments in getting rid of their stock involved some heavy and quite unlooked-for losses on the part of merchants who relied on the situa-

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

tion being dealt with in a business-like manner. As long as the Government holds large stocks of timber, and has the power to alter its policy, and make experiments there can be no stable market. However, as we have before pointed out, there is little likelihood of the Shipping Controller permitting the valuable time of ships to be wasted in delays at the ports when there is no urgent need for further supplies of timber from abroad.

United States

There is not much change in general conditions so far as the main features of the market are concerned. Generally speaking, a good tone prevails in trade circles, but whether this will continue in view of the strike of the steel workers and the shutting down of many large plants it is not as yet definitely known. Building permits awarded during August fell off considerably below those of July, but still the returns for the month were away ahead of what they have been in any corresponding period during the past five years. The first eight months of the present year have been outstanding in the matter of structural undertakings, the crest of the curve being passed in July. It is believed that actual construction work has not yet reached its minimum and the building season will be prolonged to the end of the year, provided good weather prevails. It is stated that during the past two months there has been less of building in the repair and alteration line and more in the shape of new and large structures.

The southern pine market shows great stability and while matters have been a little quieter during the past few days, there is practically no lull in the market, and it is thought that manufacturers may in time catch up with their orders. There has been a slight increase in production in some districts brought about by a better supply of labor; on the other hand, some districts report a decided shortage in help. Stocks of flooring, finish and ceiling are still being heavily drawn on and production remains under the demand, indicating that there is much building activity in the country. There is, however, an apparent exception in the case of the Georgia-Florida mills, which report a slight falling off in the call for dressed stock, regarded by them as unusual at this time in view of the fact that for a year previously no let up in this demand has been in evidence. The planing mill market has been extremely busy for some weeks and has been realizing good prices—which, it might be mentioned, are no weaker now because of the present, and likely only temporary, lull in the demand. The tendency toward price stabilization is steadily extending throughout the South, as the manufacturers are be-

ginning to realize more and more that something must be done to assure future prosperity for the industry rather than present profits. Logging operations are beginning to progress more actively, now that most parts of the South have enjoyed some days of fair weather, and the manufacturers are planning to make the most of every opportunity to insure an adequate supply of logs next season.

There are numerous foreign inquiries for hardwood, but almost the entire production is being bought up by home buyers. Prices are firm with the outlook, on the whole, very favorable. It has been noted by economists that people nowadays buy goods of a good deal higher quality than ever before; and this is illustrated in the lumber market. It is the best grades that are wanted, and they consequently are becoming harder and harder to find. It has been remarked that never before has the demand been so one sided as now, running so heavily toward the high grades. That does not mean that the common grades are being neglected; there is a market for them too, although it must be admitted that many purchasers of them are forced because the better stuff is not available. Flooring and finish are the scarcest items on the whole hardwood list, according to most reports; and prices are well maintained on everything. In this connection it is well to note the growing belief that the crest of the price movement has now been reached, although no recession this season is expected. Many retailers have given this matter of price much thought and have decided against stocking up against the future on the ground that prices can go no higher and are more likely to go down with the next season. They argue this way: Last winter there was an abnormally small cut of logs. The sharp price advances of this year were not on account of heavy consumption or buying, but because the supply was small. The next logging season will soon open, and the log cut will be materially increased over that of last year, which will alter the situation.

The situation in cypress is very active and there has been a decided upward tendency in prices. Producers have been doing everything in their power to stabilize the market and prevent any radical alteration in values. Production remains close to normal, but it is very difficult to replenish the low and badly broken stocks in view of the great demand. The country trade in the middle West especially is growing impatient for supplies for fall and early winter construction, particularly for fencing, and is willing to pay premiums on bookings if quick shipments could be obtained. Millwork manufacturers are preparing for an active business next season, confident of a great building volume next spring, and their demands are already beginning to be felt.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

St. John Reports Little Quieter Conditions

Conditions in the market at St. John are not quite so good as two weeks ago. The American buyers are not disposed to purchase at the present asking prices of the manufacturers and certainly the manufacturers cannot take any less money for their product and make any profit at all, so they are compelled to hold their sawn material.

What the outcome may be no one can tell; certainly the prices which are being offered here to-day are not profitable and if the stocks are sold on existing figures no one can go out and manufacture them and produce them again at the same prices. The costs of doing business this year have certainly been enormous, far beyond the expectations of the operators and, unless there is a great margin between the log price and the manufacturer's lumber price no producer of lumber can get out without a loss. No mills are producing up to normal and costs of handling far exceed expectations. Stocks are now at their highest and will begin to recede as the mills begin shutting down for the season, which some mills at St. John will be forced to do very soon as they will have cut out their supply of logs.

No shipments by water are taking place at the present time from St. John; also the car shortage is even more stringent than ever before and the C. P. R. will not even allow loading of foreign box cars, giving only flat cars for lumber. These are very expensive to load as it is costing \$12.00 to \$15.00 per car to stake them and oftentimes this is the profit on a car of lumber. The buyers of the lumber refuse to pay for the stakes, even though they take them at their destination. This is a hardship which the manufacturer is up against; he must pay the freight and also provide part of the equipment to carry the freight. Certainly something must be done to remedy the transportation question and it cannot come too quickly. The rail-

roads must build more cars as quickly as possible and the lumber shipper should be placed on an equal footing with all other trades, but under present conditions they are called upon to bear untold hardships.

Local business remains good, the country districts are doing considerable fall repair work. All the factories are busy. The St. John river has risen during the past week and it is hoped that the drive being up within forty miles of the booms will reach the booming limits and can be rafted out this fall. The drive contains from five to ten million feet of logs for the different mills at St. John.

Operators are now preparing for the woods and will make a normal cut on the St. John waters, but will not cut more than needed for next year's operations.

Good Demand and Higher Prices in Ottawa

Another advance in manufacturers prices, a good demand, coupled with an all around tendency toward absolute firmness, were the features of the Ottawa lumber market as shown, in the last week of September. Practically every grade in pine from old culls to good sidings advanced in price. Pine inch and a quarter, good siding, reached the top notch price of \$102 per M. and old culls advanced to twenty-eight dollars.

The advance in nearly every instance was in the pine grades. No. 1 White pine lath went to \$7.50 per M. and No. 2 of the same grade went to \$7. All sidings, strips, and practically every grade of pine "shorts" advanced. The jump in the market in the last week of September came as a surprise to some of the trade, for though advances had been prophesied a month or so ago, it was not expected the aviation would take place so soon.

The correspondent of the "Canada Lumberman" has information that even considering the latest increases that the market is going to

HALIFAX and SYDNEY, N. S. ST. JOHN, N. B.

advance still more before the end of the year. The ratio is that the demand against existing stocks, warrants it. It is a case of the visible supply as compared with requisitions. The augmented prices are the real feature of the market.

Outside of prices there was a continuous flow of inquiries and a nice business in export orders. The most of the export stock shipped went to the United States and was from mill run up to better. As compared with the late August and early September business the tendency in this regard was toward an increased demand for the better grades. South American and South African business remained about normal. A few white pine shipments went forth to each country.

The movement in buildings grades did not show much change. A confident feeling existed that these grades next spring will fetch more money than they do now. There is not yet a shortage. Dealers believe the demand now is not what it is going to be.

Retail yards were pretty well filled up. Wholesalers were fairly busy shipping to the U. S. On the other hand there may be what to the trade is known as a "shuffle" take place between the wholesalers during the winter months. This, of course, is problematical. It is subjected largely to the demand and nobody, however, in the wholesale lines showed any signs of worry.

A damper to the ardor of enthusiasm, which was showed some months ago about the opening up of the European export trade was spread late in September. The "Canada Lumberman" is reliably informed that the stocks purchased on Government account by Sir James Ball during his visit to Canada this summer, are not getting across as fast as some of the trade expected. Consequently a new order of things presents itself. The belief was current in many lumbering circles throughout the Dominion that the purchases made by the British Timber Controller in Canada would get over to Europe about the end of August. This is now upset. Stocks were shipped on Government account during September. According to a private forecast made there is not much chance of getting the remaining government stocks out of the country and overseas much before winter if not later. It is a hard thing to say but it seems to be the best informed advice on the situation at Ottawa. Any lumberman can see that, with Government stocks getting preference with ocean tonnage that, in a trade sense, it follows the fellow or firm which is not exporting to England on other than Government account, has to further sit back and await developments. Besides he holds his lumber and his money is tied up.

The labor situation for the woods remained reasonably good. Wet weather in the north country hindered the establishment of camps and the starting of actual cutting operations. In the transportation situation foreign cars showed symptoms of growing scarce. The movement of the grain crop in the United States is the probable cause. Lath and shingles were in strong demand and both remained scarce.

Conditions with woodworking factories and allied operations did not show much change.

Conditions in Montreal Are Not So Brisk

Building conditions in Montreal have caused a slackening in local requirements. Many men are out on strike, particularly carpenters and plumbers, holding up many jobs and causing an easing off in others. The masters and men are dead-locked on the question of hours and labor, and in view of the near close of the season employers are not inclined to give way, especially as the demands, if conceded, will involve a loss on existing contracts. A considerable amount of work is in hand, and there is likely to be a satisfactory addition to the jobs to be figured on providing the men are reasonable in their requirements. Should the unions succeed in forcing the abnormal rates, then construction will be restricted.

The Industrial Housing Scheme for Montreal has been dropped for the present year, owing to the difference of opinion between the Commission and Dr. Nadeau, the Provincial director, as to imposing a tax of 2½ per cent. on the loan. In other parts of the province progress is reported with schemes; for instance, St. Lambert will borrow \$750,000 and Sherbrooke proposes to form a housing company. Building generally in the province is going ahead at a good rate, and lumber is in fair request.

Orders for the United States continue to come in freely, but unfortunately foreign cars are scarce.

Pacific Coast stocks are moving rather slowly, consequent on the abnormal prices.

There is considerable activity in the sash and door section, notwithstanding the recent advances in prices. The outlook is stated to be excellent.

Export business to the United Kingdom has slowed down, nearly all the Government stock having been shipped. A fair amount of lumber is being sent on commercial account; liner freights, although cheaper than before, are still too high to permit of large quantities

being shipped. Some spruce is going forward on tramps. A large quantity of timber for shipbuilding is being shipped from Quebec, which port has still an appreciable quantity of spruce to be sent to the United Kingdom.

An Aggressive Wholesale Lumberman

Roch Julien, wholesale lumber merchant, 7 St. Peter Street, Quebec, has been connected with the lumber trade during his business life. He has had a wide practical experience, being engaged in his earlier years in the building of mills and as a sawyer. In 1906 he succeeded H. Dupre & Co., with mills and limits at Lac aux Sables, P. Q., and in 1917 opened in the city of Quebec, as a wholesale lum-

Roch Julien, Quebec, P.Q.

ber merchant. He also does an export business with the U. S. and Europe, specialising in birch. Mr. Julien is president of Julien & Julien, lumber manufacturers, Festubert, and of La Reine Lumber Co., Ltd., La Reine. The mills are at Lac Chat, Festubert and La Reine. Mr. Julien has made a great success, and is regarded in Quebec as likely to figure more prominently in the lumber trade.

The Increasing Call For Flooring

The almost universal replacement of carpets by rugs in the homes of this country makes a beautiful and durable floor an important part of a house and the production of high-grade flooring is one of the notable developments of modern lumber manufacturing, according to the Architectural and Building Code Service of the National Lumber Manufacturers Association.

Flooring of high quality is made from maple, birch, beech, oak, yellow pine, Douglas fir, and other woods; it is manufactured to exact standard sizes, of selected thoroughly seasoned stock and is as carefully handled as is interior finish.

Every detail has been considered to make a perfect floor, even to the recommendation of steel cut nails, driven at an angle of 45 degrees, with no nails placed within six inches of the ends of the flooring pieces.

The grain of woods is carefully studied. Maple, beech and birch are close grain woods which give equally good appearance and service for floors, whether slashed or quarter-sawn, and red and white oak floorings are popular.

Strictly speaking, yellow pine and Douglas fir are softwoods, but edge grain flooring made of them gives such good service that it is widely used.

Arrivals of wood goods to the Coast ports and London have been very numerous during the month of August, says an English Exchange, but it is curious to observe that the percentage of planed stocks arriving is comparatively small. Canadian spruce and Finnish red and whitewood have come forward in plenty, also Sweden has been to the fore with her sawn wood, but not overmuch planed.

Rock elm is the strongest and most valuable of the elms cut in Canada, as stated in a report on the Forest Products of Canada, issued by the Forestry Branch, Department of Interior. Red elm is at the opposite extreme, while white elm, the most abundant of the three species, has qualities between the other two. Most of the elm cut is used in the slack cooperage industry. It is also used in the manufacture of agricultural implements, boats and vehicles, and for building purposes.

TEA

This is a line that is more important in the camp than many lumbermen realize.

The men must have good tea, not good in one way only, but in every way. It must have strength and also flavor. In our Camp Blend, which is put up specially for the purpose, we feel sure that we have a tea which

is good all round quality. It has snap and at the same time is very palatable, in fact some of its users go so far as to say there is a kick in it. At any rate, whatever it is, it's giving splendid satisfaction, and we would like to add you to our list of satisfied users of Camp Blend Tea.

Steady Demand for Pitwood in Wales

Importers are Desirous of Doing Business with Canada
—Prospects of the Market Reviewed

Norman D. Johnston, Canadian Government Trade Commissioner of the United Kingdom, in a recent report to the Department of Trade and Commerce, Ottawa, says that in South Wales there is a good demand for pit wood or pit props and if Canada can compete with other countries there importers are very desirous of doing business.

Surveying the whole situation present and prospective, Mr. Johnston says:

The principal sources of supply for pitwood previous to the war, when the total importation into the United Kingdom amounted to almost three and a half million loads, were Russia, France, Sweden, Portugal, Norway and Spain. During the war supplies from Russia declined from 1,538,714 loads in 1913 to 55,304 loads in 1917, from Sweden 359,988 loads in 1913 to 76,253 loads in 1917, from Portugal 315,538 to 74,814, from Norway 114,777 to 81,273 loads, and from Spain 103,123 to 961 loads during the same period. France maintained the best position in this trade, and from 1914 to 1917 was the largest supplier to this market, her exports of pitwood to Great Britain being 984,331 loads in 1913 and 706,263 loads in 1917.

In 1913 practically no pitwood was imported from Canada or Newfoundland. On the advent of war when supplies were curtailed from the accustomed sources importers began to get some of their requirements across the Atlantic, and this trade showed signs of greatly increasing; the imports from Canada in 1915 and 1916 being 12,383 loads and 21,545 loads respectively, and from Newfoundland 86,404 loads and 81,148 loads during these two years respectively, but principally on account of the shortage of freight space the imports from Canada in 1917 declined to 1,280 loads and from Newfoundland to nil.

In South Wales very large quantities of pitwood or pitprops are used, and if Canada can compete with other countries importers are very desirous of doing business. It remains to be seen when conditions become normal whether Canadians will be able to sell their pitwood in South Wales as cheaply as those countries whose proximity gives them an advantage in shipping. A good deal of attention has also been given to home supplies of pitwood from their own forests, but transportation has been difficult.

Sizes and Kinds in Demand

In order to give an idea of the sizes in demand, one firm in South Wales is desirous of having a cargo 75 per cent 6½ feet lengths, 2½ inches to 5½ inches top, and 25 per cent 9 feet lengths, 3 inches to 7 inches top.

Another concern mentions lengths from 6½ feet to 9 feet, which are the sizes they usually import from France and Spain.

A third firm requires pitprops in 6½ feet lengths, with diameters of 4 inches minimum at tops and up to 7 inches maximum, and in 9 feet lengths with diameters of 5 inches minimum at tops up to 10 inches maximum.

A fourth house states that the cargoes they desire should consist of about 50 per cent 6½ feet lengths, 3½ inches to 7 inches diameter at the small end, and 50 per cent 9 feet lengths 4½ inches to 10 inches at the small end.

It will therefore be seen that all of these specifications vary only slightly and can very well be taken as indicative of the sizes required in South Wales.

The inquiries which have been received at this office from Canadian firms wishing to sell pitwood have been mostly of spruce and fir. Although spruce is used, firwood is preferable as collieries do not seem to care for spruce, it being stated that as spruce is brittle by nature it gives no warning when subjected to a sudden squeeze.

The trade in pitwood is at present partially under Government control, and the Coal Controller has placed a maximum price for pitprops to the collieries. The maximum price at which firwood is allowed to be sold on this market is 65s. per ton ex ship Cardiff. If Canadians could deliver c.i.f. Bristol Channel ports at about 55s. to 60s. per ton on delivered weights a good trade could probably be done. The Government is taking a great many of the ships that are available for this trade to bring sawn woods to this country, and with the high freight rates now ruling it is more difficult to do a trade. The present ruling price for French pitwood is 65c. per ton net f.o.b. Bristol channel.

One firm has a buyer who would probably be willing to send out their own vessel for a cargo of about 2,000 cords fresh cut spruce props of the specifications first mentioned in the above paragraph on the sizes in demand if they could obtain a quotation of about \$10 per cord loaded and stowed free of cost in the steamer. The importer's

remuneration in the event of business would be 2½ per cent payable by the shippers.

A great many Canadian firms quote a price per cord f.o.b. Canadian port. This is very unsatisfactory, as all business is done at a price per ton and quotations are received from other countries at a price per English ton of 20 cwt. (1 cwt.=112 pounds) c.i.f. Bristol Channel port, and Canadians who wish to do a business should quote in this manner as it is practically impossible to ascertain the freight rates on this side. It is necessary that the importer should know the landed costs in order to compare Canadian prices with those from other countries.

In making quotations it should also be stated whether the wood is stripped of the bark or not and whether the weight would be free from bark.

Major Hartt Again in the Race

Major J. I. Hartt, M.L.A.,
Orillia, Ont.

Major J. I. Hartt, M.L.A., of Orillia, who will once more be the standard bearer of the Conservative party in East Simcoe at the next provincial election, is a widely known lumberman, and for some years has been prominent in the Orange Order and the Canadian Forestry Corps. Born in 1867 in Ireland he came to Canada in 1884. Previous to entering the larger arena of public service, in 1911, he represented Orillia in the municipal council for some years. Major Hartt has long been identified with the lumber industry, and was with the Gilmour Co. in Trenton in their palmy days, remaining with that firm thirteen years. Later he took a position with the Fesserton Timber Co., after which he formed the firm of Hartt & Steele, and for a number of years

has carried on business for himself. At the annual meeting of the Orange Order, held two years ago, Major Hartt was elected Grandmaster of the Grand Orange Lodge, Ontario West; he has also been Supreme Grand Master of the Loyal True Blue Association. The Major spent a considerable period overseas in Forestry work and one of the achievements of the Canadian boys under him was the erection of a saw mill of 35,000 ft. daily cutting capacity, in the south of France. The work in connection with building the mill, erecting the machinery and getting it in operation was all accomplished within nine days—a remarkable record.

Lumbermen Do Not Want Limited Hours

At the National Industrial Conference recently held in Ottawa, J. Fraser Gregory, of Murray & Gregory, Limited, lumber manufacturers, of St. John, N.B., made an interesting and forcible address in which he declared that industry would collapse if the demands made upon it were too heavy. Consideration should be given the fact that the government took all excess profits, and apart from capital and labor the consuming public should be taken into account. Mr. Gregory spoke particularly on seasonable occupations—agriculture, building, a large part of lumbering, and other industries, were peculiar to summer, conditions making it impossible to do the work in the winter. "We should not be hampered by limiting hours," proceeded Mr. Gregory, "if the logs are not hauled to the rivers when the snow is on the ground, they have to lie there for another year. The export trade of Canada is largely made up of lumber. If we cannot produce as cheaply as other countries, we will lose the market." Mr. Gregory said that machinery had been so highly perfected that there was little manual labor in manufacturing lumber.

Association of Construction Industries

A federal charter has been granted to the Association of Canadian Building and Construction Industries, with headquarters in Ottawa. Wide powers are conferred upon the company, among them being to promote better relations between its members and owners, architects and engineers, and to establish and maintain methods of practice by the members and the industry, to disseminate useful information, extend construction and improve conditions, etc. The incorporators of the company are Jas. P. Anglin and W. E. Ramsay of Montreal, Fred Armstrong and Arthur H. Dancy, of Toronto, George A. Crane, Alex. I. Garvock, and W. A. Mattes, of Ottawa.

EDGINGS

Ontario

The sawmill of Herman Goutz, Maynooth, Hastings Co., Ont., which was burned some time ago, has been rebuilt, and is once more in operation.

The recently formed Woodworkers and Carpenters' Union are asking from the various companies in Woodstock, Ont., unionized shops, a 44-hour week, and a minimum wage of 55 cents an hour.

Hart & McDonagh, wholesale lumber dealers, of Toronto, have removed their office to 311 Temple Bldg., corner Bay and Temperance Sts., Toronto, where they have commodious and attractive quarters.

John Harrison & Sons Co., Owen Sound, Ont., are now operating four camps on Fitzwilliam Island, and intend to take out about 150,000 cedar ties this season, as well as a quantity of oak, pine and spruce logs. They have just brought down a sample of oak logs and find the timber of excellent quality.

The King Edward Construction Co. with a capital stock of \$2,350,000 and headquarters in Toronto, has been granted a charter to construct and erect hotels, apartments, dwelling houses, shops, factories, boarding houses, etc. Among the incorporators of the company are Russell P. Locke, Frederick H. McCallum and others.

Ruttan & Ellis' planing mill and factory in Belleville was badly damaged by fire recently. The blaze, when first seen, was at the doors of the boiler room, and spread rapidly until the upper part of the mill was in flames. After several hours' work the firemen extinguished the blaze. The loss was about four thousand dollars.

F. F. Fry, Limited, with head office in Toronto, and a capital stock of \$40,000, is a new organization empowered to carry on the business of general contractors for the construction and equipment of public and private works, etc. Among the incorporators are J. G. Carroll, F. F. Fry and Geo. W. Sharp, contractors of Toronto.

The civic woodyard has opened in Ottawa. Deliveries are made one week after orders are received. The price is \$13 a cord for cut hardwood and \$12 for uncut hardwood. This consists of birch, beech and maple in excellent condition. Last year the price was \$14.75 a cord. Mill wood is sold for \$7.75. The city has 3,500 cords on hand.

The mill of Halton Sawmill Co., managed by J. E. Carson of Hamilton, and located near Georgetown, was burned recently. The mill had been sawing lumber for the past two years for H. G. Cockburn & Son of Guelph, in Nassagaweya and Esqueving townships, and had recently been removed to a 75 acre piece of timber near Georgetown.

J. J. McFadden, of McFadden & Mulloy, Spragge, Ont., who spent a few days in Toronto, recently on business, states that his company have now in operation seven camps, whereas last year at this particular time they had only four. Men are more plentiful than they have been for some time and good progress is being made in logging operations.

The United Home Builders, Limited, with a capital stock of \$50,000, and headquarters in Windsor, has been incorporated, to carry on the business of contractors and builders to deal in builders and contractors' supplies, and to purchase real estate, etc. The incorporators are John G. Coleridge, Alexander Simmons, B. R. McKenzie, M.C., A. A. Smith and others.

A large real estate deal has just been completed, whereby the Canadian Aeroplane, Ltd., plant, on Dufferin street, Toronto, has been sold by the Imperial Munitions Board to the Columbia Graphophone Co. for \$600,000. The building is a two-storey structure, containing 250,000 square feet of floor space, and is the second largest plant in Toronto under one roof.

The Belt Grip Pulley Co. of Canada, Limited, with a capital stock of \$200,000, and head office in Toronto, is a newly-chartered concern to manufacture, buy, sell and deal in all kinds of pulleys, castors, trucks, and carriage wheels, and to operate factories and warehouses in connection with the same. Among the incorporators are Hugh J. Harkins, John J. Coffey, and Thos. R. McNair.

Peter S. McLaren passed away recently at his home in Tiverton, Ont. He had attained the advanced age of 99 years and was a pioneer in Bruce county. The late Mr. McLaren was born in Prescott County, locating in Bruce in 1852 and becoming one of the leading men of the district. took a prominent part in all its activities. He was a contractor and lumberman, and leaves two sons and one daughter.

The W. A. Kribs Co., Limited, has been incorporated with a capital stock of \$250,000 and head office in Hespeler, Ont. The incorporators are Gordon Kribs, R. L. Kribs, L. A. Kribs and others. The company is empowered to manufacture, buy sell and deal in all kinds of merchandise, to lease, sell and convey timber limits, to construct dwelling houses, to operate saw mills and carry on a wholesale and retail lumbering business.

The by-law to grant a free site to the Brockville Paper Mfg. Co. was submitted to the ratepayers of Brockville, recently, and carried by a large majority. 878 ratepayers voted for and only one against the measure. The site selected is the W. H. Woods property on Park St. north. On the location will be built a large building, two storeys high with basement. The dimensions will be 425 x 65 ft., and the industry will employ 150 hands.

The Canada Creosoting Co., Limited, with a capital stock of \$100,000 and chief place of business in Toronto, has been granted a federal charter to manufacture, sell and deal in all kinds of timber, lumber, wood and wood products; wood preservatives, oils and chemical materials and compounds, and also all appliances and machinery connected with or incidental to, the operation of the company. Among the provisional incorporators are Wm. A. J. Case, solicitor, and Jas. B. Taylor, and Geo. E. Atwood, accountants, and Clifford G. Lynch, secretary, all of Toronto.

A federal charter has just been granted to the Alf. McDonald Lumber Co., Limited, of Peterborough, with a capital stock of \$200,000. The company is empowered to take over the business and assets of the estate of the late Alf. McDonald, and to carry on a general lumber business in all its

branches, including logging, driving, sawing, manufacturing, etc. The incorporators of the company are Mrs. Margaret McDonald, John R. McDonald, Alf. D. McDonald, Clarence McDonald and Dennis Gleeson, all of Peterboro.

Eastern Canada

J. & W. Duncan, 1801 Ontario St. E., Montreal, have started the work of rebuilding their woodworking factory and office which was destroyed by fire some time ago.

The Riordon Pulp & Paper Co. are erecting a number of workmen's houses at Hawkesbury, Ontario. A contract for just over 30 has been let; other houses will be built next year.

By order of the Court, the assets of Mr. Paul Demers, Sash & Door manufacturer, Montreal, are to be sold by auction. These comprise the sash and door factory and a large amount of real estate in Montreal.

John Sullivan and Frank McCormick have formed a partnership, under the name of Sullivan and McCormick, and will operate for Murray & Gregory Ltd. of St. John, N. B., in the State of Maine along the Tulandic stream. They have been acting as foreman for that firm for the last two years, supervising lumber cutting along that stream.

Hugh G. Watson of St. John, N.B., a well-known lumberman, died recently in Moncton, N.B., from injuries sustained at the speedway. He was knocked down by one of the horses, which ran away. Mr. Watson was forty-four years of age and is survived by three brothers.

E. M. McLaren of the Logging Division of the Laurentide Co., Ltd., Grand Mere, P. Q., made a flight with Lieut. Graham, over some limits to the north of Lake St. John, which he wished to explore. The flight from Grand Mere to Lake St. John took two hours, but owing to a very bad head wind the return trip took four and one-half hours.

The Laurentide Co. Ltd., Grand Mere, P. Q., will install three additional grinder units, each consisting of one 2,800 horse-power motor direct connected to two magazine grinders. The new grinders will increase the capacity of the groundwood department to a total of about 400 tons, air-dry weight, of groundwood pulp per day.

Speaking at a meeting of the Quebec Manufacturers and Merchants' Association, held in Quebec, the Hon. Dr. Pelletier urged the development of trade between the Province of Quebec and Europe. As a result of his eight years' experience in England, he believed there were splendid openings for this trade, and he mentioned in particular that there was a great demand for lumber, toys and various descriptions of articles in wood. It was essential, however, that an office be opened in London with a special representative.

Considerable interest has been aroused by the formation of a company which will use aeroplanes and dirigibles to explore and exploit the hitherto practically untouched forest, mineral and fur resources of that vast stretch of territory known as Ungava. The company has just been incorporated and is composed of the following Ottawa men: Capt. E. L. Janney, late of the Royal Air Force, president; Charles Hopewell, ex-mayor of Ottawa, vice-president; Capt. J. Hedley Cameron, late of the Royal Air Force, secretary; H. C. Sherwood, treasurer, and Major William Black, late of the Canadian Army Medical Corps. The company has an authorized capital of \$75,000. The territory which is to be explored by the new company comprises about 700,000 square miles. This winter activities will be centered on a stretch of interior Ungava, lying to the north of the village of Seven Islands, 320 miles below the city of Quebec on the north shore of the St. Lawrence river. Trading posts will be established at various points of the interior of Ungava.

Western Canada

The Pitt River Shingle Mill of Port Coquitlam, B. C., was recently burned to the ground. The loss is about \$30,000.

J. C. McNabb & Son, Limited, with headquarters in Vancouver, and a capital stock of \$100,000, has been incorporated to manufacture, sell and deal in all kinds of builders' supplies, including lumber.

That more than one man should be employed in yarding logs is the recommendation of a coroner's jury which investigated the death of C. G. Storrick, a logging foreman at Haslam Lake, who was accidentally killed.

More than 12,000,000 feet of the British order of 70,500,000 feet of British Columbia lumber is now enroute to England. The representative of the British Government hopes to have 40,000,000 feet on the way over by the end of the year.

The O. I. M. Lumber Co. Limited, with headquarters in Nelson, B.C., and a capital stock of \$50,000, has been incorporated. Another concern, which has been granted letters patent is the Charles W. Johnson Lumber Co., Limited, of Vancouver, with a capital of \$30,000.

The Cochrane-Annable Company has opened up yards in Trail, having leased the limits of the G. M. Annable Company on Violin mountain, near Rossland. Mr. Cochrane is a recent arrival from Minnesota, while Mr. Annable has been in the Kootenay for some years.

To secure the co-operation of the forestry officials in B. C. province, Dr. J. W. Swaine, chief of the division of forest insects, entomological branch of the federal service, was in the West recently from Ottawa. Yellow pine has suffered in the interior, but it is hoped by proper logging operations to keep the pest out of the green timber.

One thousand men are being sought by the Finger Lumber Company to work in their lumbering camps surrounding The Pas, Man. The camps will open on the Carrot and further up the Saskatchewan river towards Cumberland. It is proposed to cut between 50 and 60 million feet of logs. To produce this into sawn lumber, the mill at The Pas is having its machinery doubled.

Sir George Bury, head of the Whalen Pulp and Paper Company, is an enthusiast on the future of the pulp industry, and in a recent interview, said that British Columbia will produce the pulp for the world, because nowhere else in the world is there grown better wood than the Sitka spruce, found on the British Columbia Coast. Sitka spruce has the longest and strongest fibre of any wood, and was used extensively in the manufacture of airplanes. It makes the strongest and whitest pulp, as strong as the pulp made by the Egyptians from linen in the form of papyrus. Nowhere in the world is there such a generous supply of pure water. One hundred thousand gallons is needed to make a ton of pulp.

CYCLONE VEGETABLE PEELER

Is a most essential part of every lumber camp or mill equipment as it saves labour and material and pays for itself in a very short time.

WILL PEEL AND WASH A BAG OF POTATOES IN FROM 3 TO 15 MINUTES, ACCORDING TO SIZE OF MACHINE.

Now in use in mines, lumber camps, large hotels and restaurants throughout Canada.

Made in three sizes for hand or power. Write for circular "L" for prices and particulars.

JOHN BURNS & CO. MONTREAL
Established 1865

A WADE does 10 mens work Saws 25 cords a day!

A money-maker and hard work saver for land clearers and wood-cutting contractors. One man can move it from cut to cut. Simple and reliable. Hundreds in use all over the U. S. When not in use for wood cutting, the 4 H. P. motor will run mills, feed mills, feed cutters, pumps, etc.

"My Wade saw is cutting wood for less than 3 cents a cord."—F. J. Williams, Burns, Ore.

"I have sawed through five-foot solid oak logs at the rate of one foot a minute."—N. P. Myers, Laton, Calif.

America must burn more wood for fuel. One Wade will do 10 men's work at one-tenth the cost. Write for free Book, "How Dan Ross cuts 40 cords a day," full details and special price.

Quick deliveries from over 100 points throughout the United States.

CRACKED!**Question No. 4***Why did
this bearing crack?***ANSWER**

Here is a babbitt-lined bronze bearing. The bronze is cracked. The babbitt did not have sufficient tensile strength to withstand the force that cracked the bronze.

The man who ordered this babbitt did not give consideration to the service expected from it. Or perhaps he thought he was saving money by using a low grade babbitt for hard service.

SYRACUSE BABBITTS

are made to meet every requirement
Tell us the service to which you want to
put your babbitt metal and we will tell
you what you should use.

**Syracuse Smelting
Works**

Brooklyn, N.Y.

THERE are buyers of babbitt who understand that a saving of a cent or two a pound on the price is not warranted when the ultimate cost is considered.

To cut his price the manufacturer has got to cut his cost of manufacture by reducing the period of alloying, he cannot afford to use the purest virgin metals.

Compare the service our Genuine Babbitts give with that of any other babbitts used for the severest possible work, and you'll know why efficient buyers throughout the lumber industry prefer Syracuse Babbitts for their bearings, to any other metal.

EXPERIENCE-The Master Teacher of McClary's

For over seventy-two years, experience in Stove making has been garnered in the cells of McClary's brains. Every lesson, both bitter and sweet, has found its use and practical application. We see the ultimate result in the present-day perfection of all McClary's products, and none more pronounced than the

"Camp Comfort" Box Stove

As its name so forcibly implies, this Stove is for Camp use. No matter what manner of Camp it may be, so long as a number of men require to be warm and comfortable, the "Camp Comfort" will meet every exacting want. It will stand the stress and strain of the logging Camp, and when not in use will occupy the minimum amount of storage space.

It has a one-piece Steel Body, a cast iron front and a stamped steel back end. Large feed door with draft slide. Legs of heavy cast-iron set in powerful cleats holding body rigid. Equipped with either top shelves or side shelves as ordered.

An enquiry at the nearest McClary's dealer or a line to our nearest Branch will bring you full information. Act to-day while we can ship promptly.

BOLINDER'S

HEAVY CRUDE OIL ENGINES

Built by a Firm Who Stands Supreme in the Whole World as Oil Engine Experts

In Sizes of
10-160 B.H.P. 2 cyl.
240-500 " 4 cyl.

The Bolinder is the most economical and efficient propulsive power for

Tow Boats and Barges

It operates at a cost of only $\frac{1}{2}$ cent. per Brake horse power per hour—an enormous saving as compared with steam. It dispenses with firemen—thus reducing the wage and food bills.

SIMPLE, DEPENDABLE, DURABLE

The Bolinder is extensively used in the British Navy. Some 300 Bolinders were ordered during the War by the Admiralty, some of them for Monitors patrolling the Flanders Coast—a remarkable tribute to the high qualities of the engine.

Over 13,500 Bolinder Engines equal to 650,000 B.H.P., are in successful service in all parts of the World. In Canada and the United States, the Bolinder propels vessels aggregating 175,000 tons D.W.

USE SKIDDING AND LOADING MACHINERY

IN PLACE OF MEN TO REDUCE COSTS AND INCREASE OUTPUT

The September 1st issue of the "Canada Lumberman" had an interesting consensus of opinions from a number of prominent lumbermen as to the prospects for this season's cut. The following extracts from a few of the writers deal particularly with estimated costs and output.

"The cost will be even higher than in 1919, which was the worst year we ever had to take out stuff, as far as costs go."

"Last year the output was very small, making the overhead enormously high."

"All the operators are going in heavier this season, and as a consequence woods labor has become very scarce."

"The real bushman is such a scarce article as to be almost a man of the past."

"The only hope of getting cheaper logs this year will depend on the efficiency of the labor in the camps."

"The good class of lumbermen have all disappeared, and it takes at least three men to do two men's work."

One of our Loading Engines will handle 2,000 logs per day.

It will take the place of many men, doing their work at much less cost.

Why waste money on inefficient labor when machinery will do the work better?

Our Booklet, "Suggestions for the Lumbermen," describes methods of using Skidders and Loaders. Shall we send you a copy?

Sales Agents: **MUSSENS, LIMITED, MONTREAL, TORONTO, WINNIPEG AND VANCOUVER**

The Three Goodhue Belts

"EXTRA" "STANDARD" "ACME WATERPROOF"

These three brands are made for three different services and each brand is the best quality made from selected hides with the stretch taken out.

"Goodhue Belts" stretch less than any other belt by 15 to 25 per cent. This quality effects a great saving because it is unnecessary to be continually shortening the belt to keep it taut.

"Acme Waterproof" brand is made for the wet places in a mill and will give a remarkable service under the most trying conditions.

When you buy a belt—buy a Goodhue. Prices and particulars on request.

Ask any Filer about the quality of Disston Crucible Steel—made in the Disston Works since 1855.

AN "ALL DISSTON" MILL.

It is very frequently found that every saw in use in a modern, efficient mill is a Disston.

In fact, after Disston's 80 years of leadership, it could not well be otherwise.

Wherever lumber is produced, it is known and acknowledged that Disston Saws represent the maximum in quality and in true-cutting, profitable service.

DISSTON-SAWS

The Quality Standard that Produces "Plus" Service Belting

The only sure way to get satisfactory service is to buy products of known worth.

In Dominion Rubber System Belting, the worth is known because every ounce of material—each individual operation and each finished belt must test up to the highest quality standard ever made for belting.

From the time the materials come into our factory until the belt is running on your pulleys, there is no chance of your getting anything but "plus service" belting.

This is the result of over fifty years of belt making experience and research by the oldest, largest and most completely equipped rubber organization in Canada.

The rubber that goes into Dominion Friction Surfacing Belting is not a mere waterproofing substance—our chemists have given it a far greater value by making it into a friction compound that prevents practically all power wastage on the pulleys.

"Plus service" includes the free technical advice of our belting engineers who are ready to help you with your transmission and conveying problems without placing you under obligation to us.

A phone call, wire or letter to our nearest branch places all of our facilities at your disposal.

LINK-BELT SAW MILL CHAIN

BY REASON of the long continued maintenance of such high standards of excellence, insured by rigid tests and careful inspection given to every foot of Link-Belt, by a skilled chainmaking organization; and our large available stocks; we have developed our line of saw mill chains to a high standard of quality. We solicit your business on the basis of quality and service.

Look for this trade  mark on each link. It identifies the genuine Link-Belt—every link of which is guaranteed.

FIRE BRICK

We make several brands of fire brick made by every known process of manufacture from a selection of various high grade Pennsylvania clays. This enables us to furnish the best adapted fire brick for your boilers, dutch ovens, refuse burners, kilns, etc.

We specialize in fire brick for power plants and if you will advise us whether your boilers are hand fired or stoker fired and kind of fuel used we can then give you the proper brick for your work.

We manufacture the following well-known brands:

**"Elkco Special," "Elk Steel,"
"St. Marys," "Keystone" and "Rotex"**

The Reason Your Horses Should Wear This Pad

is a logical one; it gives protection to the horse just where it is most needed—the neck and shoulders—which are usually subjected to hard and injurious rubbing.

The Tapatco Collar Pad is therefore a necessity to keep the horse in right condition.

The Patent Hook attachment is a feature that ensures long service from the pad.

If your horses are not wearing Tapatco Collar Pads you are omitting an important accessory to their equipment.

You'll Get Splendid Wear from Our Working Gloves

Warm, comfortable, pliable and hard wearing. The very thing for the lumber camp and most reasonably priced. Ask your jobber for these goods.

The American Pad & Textile Co.

Chatham, Ontario, Canada

When You Buy "ASBESTOL"

you get more than a pair of gloves. The trade-mark "ASBESTOL" is your guarantee for comfort, long wear and absolute satisfaction.

"ASBESTOL" Gloves & Mittens

**Reasons
Why
You Should Use**

ATKINS STERLING QUALITY SAWS

Reason No. 1 -- Atkins Steel

THE sterling quality of Atkins' superb saw steel is in itself an all sufficient reason for the exclusive use of Atkins' Saws. True steel like pure silver shows the quality of its metal when put to the real test: Atkins is found to be as true as it is possible to make quality tool steel. Free from flaws and seams, it is fashioned with consummate skill, and in the heat of the forge proves itself the ideal metal for the ideal saw. Comparison will confirm our quality claims.

OVER 1000 INDUSTRIALS USE

EXTRA POWER BELTING

ON RECORD in our offices alone are the names of over 1000 Canadian industrials who are satisfied users of Goodyear Extra Power Belting.

A vast hive of industry, giving employment to thousands upon thousands of men. Engaged in every form of industrial activity known in the Dominion. Turning out millions of dollars worth of Canadian products every year.

What an overwhelming endorsement of Goodyear Extra Power Belting this is. Belts bought to fill every transmission requirement. Working

under varied conditions. All required to deliver satisfaction.

Think of the great power-saving because Extra Power Belting is flexible. It grips the pulleys and combats slipping. Greater production has almost invariably followed the use of Goodyear Extra Power.

Over a thousand trained Engineers and superintendents cannot be misled. You cannot blind over a thousand purchasing agents. There must be—there is—something vital in the Goodyear Extra Power Belting story. Let us send a man trained by Goodyear in belting problems to talk it over with you. He will tell you about Extra Power as it applies to your plant. Should Extra Power not be suited to your needs, we would rather have your friendship than your order. Phone or write our nearest branch.

DUPL **EX** FOUR
WHEEL
DRIVE
TRUCK

Haul More and Save More

Reports of extraordinary savings continue to pour in from every community where the Duplex 4-wheel Drive gains a foothold.

It makes no difference whether these reports come from remote mining regions, oil fields, lumber forests, road building or the crowded highways.

Everywhere they show a saving in favor of the Duplex.

And those savings run from 20 per cent. to as much as 60 per cent. per ton mile.

Remarkable—yes, but not so remarkable when you analyze the reason for Duplex economy.

It is simply a matter of driving power scientifically applied to all four wheels instead of two.

In the Duplex drive the pull is positively continuous. The strain is equalized. The load is better balanced. A full load is carried every trip

All these elements tend to lessen wear on truck and tires, and get more miles out of gasoline.

On tires alone Duplex savings average 30 per cent. There is no need for dual treads on the rear wheels.

Convincing as these reports are, a comparative test of the Duplex shows up even more to advantage. The worse the conditions, the better the Duplex demonstrates its very real superiority.

It proves its merit best in the steady, all-day grind. Over concrete or sand, or hills or where there are actually no roads, the fourfold driving power of the Duplex always records a decided economy.

If you will study these records and then witness a duplex performance, you can't fail to see why the logic of Duplex economy is unanswerable.

A Rugged Pulley-Gripper

There is nothing like leather for belting, and SparOak Leather Belting has peculiar advantages all its own.

SparOak is a two-in-one belt combining rugged strength with unique pulley-grip. Its great endurance and minimized slip make it a double-service belt of unusual qualities.

Two kinds of leather enter into a SparOak Belt. The outer ply is oak tanned, cut from the best selected center stock. The ply next the pulley is Graton & Knight Spartan leather, tanned to give pliability and traction power unequalled by any other material.

SparOak Belting

MADE
IN
CANADA

Here is an 18" SparOak Belt on a hard drive in a warm, moist atmosphere where the extreme flexibility of Spartan and the firmness of Oak leather are necessary. SparOak is the answer to a great many perplexing belt problems, saving power and standing up under the most severe conditions.

If you have a troublesome belt drive, consult us as to what belt is required. Maybe it is SparOak, but in any event one of the Graton & Knight Standardized Series of Belts will fit exactly. Write for our booklet on Standardized Belting.

SparOak Belts grip from the start. During the weeks most new belts take to "work in," a SparOak Belt is giving full power and keeping production up to normal. And SparOak Belts keep on gripping for years under adverse conditions. They withstand repeated shifting, and the wear against step cone or flange pulleys. They render efficient service on drives with high speeds, small pulleys, and heavy loads. In short, any of the factors that quickly wear out ordinary belts affect SparOak belting amazingly little.

Results that Count

If you have a Proctor Dryer you get uniform results

Proctor DRYERS for VENEERS

give a perfectly flat and pliable product without checks or splits

The Proctor Dryer represents the most efficient and economical method of drying. It is absolutely constant in action regardless of outside weather. Compact. Dependable. Fireproof. Made by the oldest and largest builders of dryers.

Write for a Proctor Veneer Dryer Catalog.

Sawmill Machinery

The Waterous Twin Circular Saw

in conjunction with the Kendall Circular Gang presents the cheapest way of turning small logs into merchantable lumber.

Points every man interested in this great industry should note and remember.

THE TWIN CIRCULAR consists of two independently driven saw frames carried on planed iron slides upon which they are adjustable, to permit cutting a cant as narrow as 4 inches or to a width of 12 inches.

FRAME CASTING is in one piece with bearing cast solid with the frame to make mandrel alignment a certainty. The saw frames are adjustable by rack and pinion and controlled by a hand wheel which gives rapidity of movement with a minimum of effort and no possibility of a shift during cutting.

SAWS are 42" in diameter and run at 700 R.P.M.

MANDRELS measure 3,7/16 inches diameter and carry a 20" x 13" pulley.

Hall Machinery Co., Sherbrooke, Que.

Not altogether what we say, but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

SAWN LUMBER

G. A. Grier & Sons Limited

For nearly half a century we have given satisfactory service to lumber buyers of the Dominion. Handling the best forest products and possessing excellent mill and transportation facilities, we are in a position to supply you with the best forest products in the following woods:

Pine, Spruce,
Hemlock, Hardwoods
and
B. C. Lumber and Timber

For rush orders—we make a specialty of mixed carloads from our Montreal storage yards, where we always carry a stock of all local woods as well as Pacific Coast lumber.

BRITISH COLUMBIA RED CEDAR SHINGLES

MADE UNDER PATENT
RIGHTS TAKEN OUT BY
NATURE

THE secret process whereby Nature stores in the Red Cedar of British Columbia the qualities which make it the ideal roofing product of the world, are beyond the ken of man.

EVERY other form of roofing aims to imitate—in quality—in appearance—the results attained by using Red Cedar Shingles.

LIKE all other imitations of Nature, these fall short. No man-made product—the result of quick manufacture—can approach Nature's laboratory methods, whereby the moisture and sunlight of a generation is utilized in the storm-defying weather-proof texture, and the storage of decay-resisting oils, permeating the entire shingle.

Nature Roofing is superior, and the best type of Nature Roofing is found in British Columbia Red Cedar Shingles.

Owing to the exceptionally strong demand, dealers are advised to place their orders with the British Columbia mills at the earliest possible date.

We are prepared to furnish dealers with supplies of our B. C. Red Cedar Shingle Booklets for distribution to your patrons. Write to-day, stating how many you can use.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice, at Buffalo, N. Y., under the Act of Congress of March 3rd, 1879.

Vol. 39

No. 20

False Ideals and Economic Losses

"Not how good, but how cheap," seems to be the animating motive of no small proportion of the populace at the present time. Owing to the high cost of material there is a disposition on the part of certain speculative builders and others to erect dwellings that are showy and attractive rather than those which are substantial and permanent. What the purchase of a house "don't know won't hurt him," appears to be the structural philosophy of these gentlemen who are buying up cull lumber, cheap shingles, No. 3 lath, and everything else that is far from possessing strength, endurance or reliability.

Attention has been called to this phase of the situation several times, but still the work of sacrificing quality goes steadily on. In the long run neither the purchaser nor the contractor is satisfied, and experiments in most cases prove very costly and create heart burnings and bitter misgivings. Any workman knows there is no satisfaction in cheap tools, that their purchase is a dissipation of money and their use a waste of effort and the same observation applies with respect to incorporating in a home material that will not withstand the test of time and use. The home is the strength and bulwark of the nation, and if it will not endure, then our communities will savor of the nature of the mushroom towns and mining centres of the west where existence is generally brief and cosmopolitan birds of passage predominate. In the older centres, however, the home is supposed to represent fixity of purpose, stability of interest, and solidity of effort. It should be erected so that it will not be a handicap to industry or enterprise. It is part of the national machinery, the machinery that produces Canadian cities, and in this connection the "Contract Record" asks, "is it logical to suppose that a poor type of house will turn out on the average a high type of citizen?"

Canada needs good buildings. That is a fact that cannot be too

strongly emphasized. We have a severe climate, and we must erect buildings of a type that will protect our workers both in home and factory from the extremes of heat and cold. Then there is the question of fire waste, about which too much cannot be said. We must allow the erection of no more flimsy fire-traps. Fireproof or fire-resistant structures, we must have, and it is encouraging to note that the majority of manufacturers and municipalities are beginning to realize this fact. It would indeed be cheaper to pull down dangerous structures right now and re-build them in a safe type of construction, rather than to wait until they burn down, with the resultant danger to the lives of the occupants, and the destruction of the goods and equipment contained, as well as the endangering of life and property in the surrounding community.

From another viewpoint, the folly of using poor materials and "cheap" construction is evident. Wages are now higher than they ever were before, and labor constitutes about 40 per cent. of the cost in building work. Is it wise, therefore, to throw away high-priced labor on cheap buildings that will not stand the test of time and climate? Surely not. The best material is generally the cheapest in the long run, because it lasts longer and gives better service in every way. Cheap lumber or cheap shingles are a poor investment, and concrete lacking the proper proportion of cement is no economy, except for the speculative builder who isn't permanently in the contracting business. Neither is a flimsy lath and plaster or frame shack the proper type of dwelling for the Canadian climate. But it's not against the type, so much as the quality, that objection is raised. Excellent houses can be built, using stucco, hardwall plaster, or frame construction, but, in the effort to cut down costs, some houses are being put up at the present time which, to use the expression of a critic, have walls that one "could whistle through." This is sheer waste of money. Good citizens won't live in them unless they are forced to, and to be forced to live in them will make them poorer citizens. In the name of common sense and humanity, let us build solid houses. The children of the poor should have protection against heat and cold, and room to breathe, just as much as the children of our millionaire profiteers.

Housing Fiasco in the Metropolis

Lumbermen throughout the Dominion are interested in the Federal Government scheme for erecting workmen's houses to meet the pressing demands in every part of the country. It involves the expenditure of \$25,000,000, a considerable portion of which would necessarily be spent in lumber. We may assume that in houses of this description lumber to the value of \$5,000,000 would be used. The Quebec Legislature last session passed a special Act dealing with the subject and regulating the conditions, financial and otherwise, under which the scheme, so far as it affects the province, is to be carried out; a technical commission has also been appointed to develop the scheme and to supervise the work in a general way.

Progress, however, has been slow, and in the case of Montreal the plan has been a fiasco. Hull, Sherbrooke, St. Anne de Bellevue, Quebec, Three Rivers, St. Jerome and St. Lambert are all negotiating for loans, but whereas the province's quota of the \$25,000,000 set aside is \$7,000,000, the applications for loans to date total \$16,000,000; an evidence that the need is far greater than the possible supply of houses, with the money available. This does not take into consideration the city of Montreal, where the scheme is hung up. The scarcity of housing accommodation there is very acute, yet practically no steps have been taken to put the Act into operation.

There are two main reasons for this lamentable lack of enterprise. The Administrative Commissioners, after consulting various bodies, appointed a Housing Commission of five members—eminent citizens, but with no experience in the work, and with not a single representative of the constructional interests. To begin with, two members resigned almost immediately, and now a third has dropped out after a short experience. Various reasons are given for these departures, but the explanation given by a former member is that the scheme is unworkable. The work can be carried out either by the cities or towns, by individuals, or by companies, borrowing the

money from the province at 5 per cent. There are certain other expenses which are inevitable, and the interest ultimately to be paid will more likely be in the neighborhood of 8 or 9 per cent., as $2\frac{1}{2}$ per cent has to be paid for the expenses of the Technical Commission. It is unlikely that any city or town will embark on any building operations, and housing companies will not be attracted by the proposition, owing to the amount of dividend being limited. These are the objections to two of the methods for carrying out the Act, although it may be pointed out that in the cities and towns, which have applied for loans it is proposed to form companies for this purpose. As to individual loans, the objection is that the Housing Commission cannot properly supervise the construction, that the estimates are likely to be exceeded, and that in fact the chances are all in favor of the municipalities having to bear the burden of uncompleted houses.

Considerations of this character weighed with the men who have declined to remain members of the Montreal Commission. But beyond this, there is a very marked difference of opinion as to Montreal contributing $2\frac{1}{2}$ per cent. of its share of the loan, for the expenses of the Technical Commission. Mr. Alf. Lambert, who has just resigned from the chairmanship, strongly opposed what he regarded as an unjustifiable tax and as an endeavor to make Montreal bear the greater share of the expenses of the Commission. There is thus a deadlock. While a certain amount of advancement has been made in other parts of the province, Montreal, the most important factor in the general scheme, is for the present to be counted out. If anything practical is to be done to meet the housing requirements of the city quick action is required. Already too much time has been wasted, and if Montreal is to benefit, preparations must be made during the winter for work to commence in the spring.

Mr. Lambert complains that the Administrative Commissioners have not backed up his efforts to get something effective done. The Commissioners failed to pass a by-law defining the duties and powers of the Housing Commission—although one was submitted—and also give authority for borrowing money for the work. The consequence is that men who offered to organize housing companies have not been able to go ahead. The whole affair apparently is an example on how not to administer the Act.

Why Woodsmen Really Leave Home

The life of a bushman is both rugged and picturesque. It partakes of the romantic and the practical, and much depends upon the viewpoint. In the days before the war there was little need of advertising in order to secure a sufficient number of strong, stalwart, sturdy chaps for logging operations, but, like many other avenues of industrial endeavor and achievement, there has been a marked change in the method of operation and the personnel of the working force.

The average worker apparently believes that the great panacea for all economic ills is shorter hours and higher wages, and if these are not secured then an ultimatum is frequently launched in the shape of a strike. In the realm of commercial affairs, advertising is supposed to solve many difficulties and make smooth the pathway to any desired goal. The whole social order of things was upset by the recent European conflict, and events, customs and practices that would have staggered us in the days of old are accepted at the present juncture with an equanimity and sang-froid that is almost startling. We have ceased to be aroused by the ordinary and even the extraordinary and the exaggerated do not create more than a passing interest, all of which leads up to the observation that the lumber industry, from its open air, primeval character, will always enlist the attention of various nationalities the world over.

In a recent issue of a Toronto paper one employment concern advertised for fifty bushmen, and in order to induce a large influx of applicants stated that in this particular camp in North Ontario mostly Britishers were employed. It was also pointed out that an Irishman was the foreman, which means that his name must carry weight and influence with the rank and file of lumberjacks, but for real attractiveness, originality, diversity, effectiveness and attention compelling details, a refreshing announcement lately appeared in the "Want Columns." In it are touches of the sublime and the ridiculous, the grave and the gay, the stirring and the tender, self-reliance and human

weakness, mountain peaks of contentment and vales of despair—but why go on in this strain?

Read the advertisement and learn all these particulars first hand. In some instances the clarion call and seductive appeal beats any recruiting rally ever held during military campaigning days.

2,000 Bushmen—We send men every morning and every night to the camps. Rail fares are paid by the lumber companies, and not deducted if stay from three to six months. Present wages \$60 to \$65 month with board and lodgings free. It is usual to work ten hours daily. No Sunday work. These camps are run by large and responsible lumbering companies. The work is cutting down trees, mostly pine trees, chopping off the branches and sawing up into logs, making temporary roads through the bush, rolling and skidding the logs to the main roads, etc., good healthy work for able bodied, full blooded men of any nationality, willing to do an honest day's work. The work is easier and healthier than concrete or pick and shovel work, and working among the pines in the bracing northern atmosphere makes flesh and bone that cannot be beat; always provided you keep your feet dry and your nose clean and tidy. Men who have not been in the bush before need not expect to find palaces. The life is rough and ready, but there is usually more and better food served than can be bought here for fifty cents a meal, and there are lots of good warm blankets. The camps have stores where all necessary supplies may be had, tobacco included, these you can have charged against your wages after you have worked a while. Many men who cannot save money here do so in the bush when they stay through the season, about six months, coming out in the spring with \$300 to \$400 in their jeans. Don't go to the bush unless you have made up your mind to rough it, and don't go unless you intend to stay at least three months. When ready call on us with one dollar fee and we will do the rest. Remember, shipping every night and every morning for Massey, Cartier, Thor Lake, Nairn Centre, Milnet, Collins Inlet, Foots Bay, Shawanaga, Sturgeon Falls, Mac-Tier, Hanover, Bolger, Ravensworth, Lake Bolkaw and Nicholson.

Editorial Short Lengths

Business failures in Canada to-day are the lowest on record. Last year, out of thousands and thousands of manufacturing and financial concerns, storekeepers and others doing business, only 873 had to close their doors. In 1917 the number was only 1,097. These are phenomenal figures and indicate a state of prosperity never before approached.

To find a year when failures were as few as in 1918, we have to go back 36 years, to 1882, when business concerns were not half as numerous as they are to-day.

* * *

Speaking of trade opportunities in Great Britain for the Canadian manufacturer, A. L. Dawe, of Montreal, secretary of the Canadian Pulp and Paper Association, who spent several months overseas, surveying the field for that particular industry, says, "the opportunities in the Mother Country are just what Canadian manufacturers desire to make them. The business is there waiting for them. I found that many of the larger Canadian firms had already sent representatives to England, with a view to turning the present trade into a permanent market. But my experience has been that the only way to get this trade which is waiting, is to send over expert men, and look after it, just as firms here do for the home trade in Canada. If our manufacturers do this, I see no reason why a large and profitable export trade to Great Britain should not be built up."

WORK OR WANT

Production is a world necessity.
Cost of living is increased by empty shelves and idle plants.
Decreased output means increased selling price.
Greater production alone can assure the safety of our nation.
Be a Peace Patriot!
PRODUCE!

Lumber Price Levels Will Be Maintained

Unlikely That There Will Be Any Radical Changes Until Next Season's Cut Comes on Market and Value Thereafter Will Depend Upon Various Factors

There is much discussion among lumbermen to-day regarding the future course of the market. While this is natural enough at any time, it is of special importance to-day for a number of reasons. With a few minor interruptions, the market for lumber in Ontario has been good, ever since the extreme demands arising out of the war brought to an end the period of inactivity following the collapse of the real estate and building booms of 1912 and 1913. The market for lumber from that date to the present has been characterized, to a very extent, by two outstanding features, namely: Reduction in output at an increase in cost, and a strong demand. There have been times when the demand, shifting from one use to another, has been less active, but in a general way, during the period of war use, and now during the period of reconstruction, there has been a strong demand of a fairly general nature, throughout the last few years. These conditions should be borne in mind by anyone who tries to develop a workable theory of market changes for the immediate future.

How General Stocks are Depleted.

Growing out of the conditions outlined above, the trade is approaching the coming winter with certain strongly defined features. In the first place, the result of the reduced output for several years is that there may be said to be a famine in lumber to-day. Last year's stocks had been practically eliminated before those which the mills produced this year came on the market. What the mills will have produced this year has been subjected to keen demand and will be used up more rapidly even than was last year's production; so that the trade will enter next Spring with an even greater shortage than existed in the Spring of 1919. These conditions, and the high cost of labor and materials, are responsible for the increasing price which lumber has brought during the past year. The question upon which the whole situation seems to rest is how soon these conditions may be expected to give place to others which will make for lower prices.

Much the same problem has confronted lumbermen annually as each year's operations got underway. During the last few years there has been increasing uncertainty as to what changes might be expected; but during the continuance of the war the uncertainty was increased by the impossibility of foretelling what the effect of the end of the war would be upon industrial conditions. Each Fall, retailers have been in doubt about the buying policy for the Winter months, and each Spring they have been much in the dark about the conditions that could be expected during the approaching Summer. Each succeeding year's problem seemed to be more difficult to deal with during the continuance of the war, until, at the end of the winter of 1918-19 there were many retailers who had given up the attempt and had become pessimistic enough to assert, much too publicly, that the bottom had fallen out of the market and we were in for a bad Summer. This attitude of depression was unreasonable, and there were a few who predicted an exceptionally active Summer. The course of events during the year has more than justified the latter prediction.

Why Changes Have Been Wrought.

Looking back upon the Summer months of 1919, it is easy enough to see what has brought about the change. The lumber requirements of the people of Canada for industrial expansion and house building had been neglected for so long that they became an important element in the demand. This applied not only to Canada but to the whole of North America and the manufacturers of lumber found their market extended in nearly every direction, until a "runaway market" developed, with lumber, as it has often been said, "auctioned off to the highest bidder."

Anyone who makes a hobby of prophesying should be able, by considering these points, to see with some degree of exactness, what is ahead of the trade during the coming Winter and part of next year. Conditions such as those which have prevailed during the past year can reasonably be expected to continue until the logs that are taken out of the woods during the coming Winter reach the market in the form of lumber during 1920. Lumber consumers will have to get along until that time with the meagre supplies that are now available.

Next Summer will be the testing time for the trade. Operators are to-day planning far more production than for many years past. Woods labor is more plentiful, though still very high in price and inefficient. With good operating conditions during the coming Winter, there should be a larger output of logs than has been the case for many years past.

What capacity will the market have for absorbing the increased

output next year? Barring social and industrial upheavals which must be left out of consideration because they cannot be foretold, it is more than probable that even an abnormally large production of lumber next year will find a hungry market waiting for it. It will have been produced at a comparatively high cost, if present labor conditions continue. If the demand continues strong it may be expected that lumber will hold its own fairly well.

Present Firmness Likely to Continue.

These are the conditions which would lead most smoothly to a satisfactory return to normal trade. While the wish may be, to a considerable extent, father to the thought, these conditions are being predicted by manufacturers and wholesalers. They are being anticipated also by many retailers. If these conclusions are not seriously at fault, the trade may look forward to a fairly good Winter's business, depending, of course, upon the severity of the weather, and to good Spring and Summer business to follow. The present firmness of the price situation is likely to continue until next year's cut comes on the market and the course of the prices thereafter will depend upon factors which lie in the future, such as the extent of the Winter's cut, the possibility of resuming the export trade, the cost of the stock that has been produced during the Winter and the existing labor situation.

There is no question but that, with reasonable encouragement, the demand for lumber will be sufficient to offset any unsettled market conditions which might conduce to rapid price decline. The natural conclusion to reach, with such information as is now available, is that the decline in price, which seems to be fairly generally expected, will come about gradually, commencing possibly towards the middle or the end of next Summer and that it will be so gently tempered as to involve no real cause for anxiety about next year's trade.

Uprooting The Wooden House Prejudice

In the last issue of the "Canada Lumberman" reference was made to a proposal by Mr. F. C. Wade, Agent General for B. C. in London, Eng., that Great Britain should meet the housing difficulty there by the importation of wooden houses. Although there was at first opposition to this proposal, the Ministry of Health seems to have been won over, and to have taken steps to remove restrictions in the building laws which will make for the construction of this class of house. The Englishman has been prejudiced in favor of the brick house, but under the stress of a famine in dwellings, opinion has changed, and there is now a demand for the cheaper and more quickly constructed wooden house. Whatever their defects, they cannot be worse than the thousands of jerry built houses constructed in Great Britain.

Canadian firms have not been slow in getting after this business, and negotiations are proceeding for the supply of a large number of houses. According to a cable, inquiries have been received for Canadian houses for France, Belgium and the Mediterranean. Our readers are acquainted with the difficulties which faced the Canadian Timber Products Association early this year in the matter of a large order for portable houses for France. The shipping freights proved a bar to the closing of this business, and it is to be hoped that there will be no repetition of this handicap. Canadian woodworking interests want all the work possible, and it would be a matter for regret if after all the spadework put in by Canadians the order for houses for Great Britain should be diverted to other countries.

It is understood that the designs and specifications submitted by the Ministry of Health did not meet with the approval of the Canadian firms interested, and that alterations, the result of experience on this side, have been suggested.

Mr. Wade, in an interview in London, naturally boosted B. C. fir; it was the "best wood in the world," he declared. Mr. Wade also said many good words for the wooden house. "These wooden houses," he stated, "are more damp-proof than the average brick house. The wooden house is general all over Canada, the United States, and South America, and is satisfactory in every way. There is no need to worry about any danger of fire." Why Englishmen like to live in brick houses Mr. Wade cannot understand. Brick, he said, is not damp-proof, is not good to look at, and is not cheap. Though he could not say what they would cost in England, he was sure they would be much cheaper, even adding the cost of freightage, than the conventional house of brick.

Some Practical Plans in the Cutting of Timber

Experimental Work to be Conducted by Leading Lumber and Paper Companies— What the Investigations Will Include—Visits to the Areas

Propaganda for the better treatment of our woodlands has always carried a prominent and noteworthy characteristic in the sympathy and co-operation of the lumbermen. The meeting of foresters and lumbermen in frank and open discussion of their problems invariably incites comment of admiration and envy from the visiting foresters from other countries. A striking characteristic has been friendly co-operation—in discussion.

Foresters and lumbermen have met and talked and made resolutions on the advisability of doing certain things for the benefit of the forest. They have separated to meet again next year to talk and make more resolutions. They have been doing this for thirty years and they have accomplished much in an educational way. But in reality the forests can be improved only by action in the forest, not in the office chair, not in the hotel corridor, not even at the banquet table. However, the more progressive lumbermen and foresters have realized this and so it has come to pass that theories are to be put into practice. Indeed, the only way to determine whether or not a theory will work is to try it—a self-evident fact lost sight of by other men than those interested in the welfare of the forests.

Experimental Cutting of Spruce Limits.

The Bathurst Lumber Company, in co-operation with the New Brunswick Forest Service is carrying on experimental cuttings on 500 acres of under-sized spruce on the Nipisquit River. A portion of the area is being cut under the strip system. Strips from one chain wide to three chains wide are cut clean, with strips two chains wide each uncut or lightly culled. A portion is being cut clean in more or less circular patches of various sizes, comprising one-quarter acre to two acres in extent. Other portions are being thinned by cutting to 10, 8 and 6-inch diameter limits respectively. The slash on one-half the area of each cutting system is to be burned and on the other half unburned. The Provincial Forest Service furnishes a forest engineer who, in cooperation with Mr. Lordon, of the Bathurst Lumber Company, will carry out the plans of the cutting.

The Laurentide Company, in co-operation with the Quebec Forest Service, will undertake similar experimental cutting in a stand of 300 acres, mostly culled only for pine on Cache Lake, whose waters reach the St. Maurice River at Rapid Blanc. The area contains a peat bog, a merchantable black spruce swamp, balsam and spruce ridges, a merchantable stand arising from an old burn, and mature spruce and balsam in various degrees of mixture with hardwoods, so that most of the types in which logging operations are being conducted in Quebec are represented on this comparatively small area. The Logging Department and the Forestry Division of the Laurentide Company and the Provincial Forest Service will co-operate in carrying out details of the cutting.

On both areas a careful record will be made of the cost of slash burning.

Keeping Tab on the Growth.

The Commission of Conservation at Ottawa has the task of measuring and recording the results on each of these experimental areas. Sample acres will be laid off and the volume of wood fibre and rate of growth under the present and past conditions will be ascertained and will be used as the standard to measure the results of the various methods of cutting in terms of future growth.

The investigations will include the effect of cutting to various diameter limits upon windfall, upon diameter increment, volume accretion, upon the growth of the young trees already established in the stands, and the reproduction of the commercial species after the cutting. The areas upon which the slash is burned and those upon which it is unburned will be used for a comparative study of the effects of these two conditions upon reproduction and, in co-operation with the Dominion Entomological Branch, upon prevalence of insect diseases. These areas (burned and unburned) will also be studied in a comparative way by an expert from the standpoint of breeding ground for the various heart rot diseases of spruce and balsam.

This work will be carried on during the logging operations and will doubtless occupy a small investigation party during the coming summer. After that, it is planned to visit the areas periodically for a number of years to measure and record results. In this way only

can accurate and useable data be obtained from the experimental cuttings.

Special Study of Spruce Budworm.

Negotiations are on the way between the Fisheries Branch at Ottawa, the Provincial Forest Service of New Brunswick and the Commission of Conservation to establish an experiment station on 240 acres belonging to the Mirimachi Fish Hatchery of South Esk, New Brunswick. The area is badly infected by spruce budworm, and a special study will be made of this disease on the area of the Dominion Entomological Branch. The area is being cruised and plans drawn up for regulated cutting.

In this connection, it might be mentioned that the Commission of Conservation and the Entomological Branch, in co-operation with the respective companies have already established some 25 acres of permanent sample plots on the Laurentide Company limits at Lake Edward and on the Riordon Pulp and Paper Company limits on Lac Tremblant, where a detailed study is being made of forest insect and fungus diseases; of the effects of the various degrees of cutting on the regeneration and growth of spruce and balsam; and particularly experiments are being inaugurated to determine the conditions for a more abundant natural reproduction of spruce after logging.

Forest Problems of Economic Bearing.

It is reported that the Riordon Pulp and Paper Company has under way plans for the establishment of an extensive experimental area, some 5,000 acres, it is said, where not only different cutting methods will be tried but also experiments in broadcast seeding and in underplanting in the various conditions usually presented by logged-over and burned-over lands. Detailed and expert studies like those outlined above for the other cutting areas will be encouraged and facilities supplied for them. In fact, the plan is apparently to develop a forest experiment station where any investigator or investigate body of proved achievement may attempt to solve forest problems of economic bearing.

Making Food Palatable for the Equine

For many years breeders of thoroughbred horses in England have realized the value of using molasses for conditioning. In Canada there have been various prepared stock foods in which molasses were used; for these prepared foods the user paid a fancy penny. The Cane Mola Company of Montreal are going after stock owners to use the straight unprepared sugar cane molasses which they import in large quantities, and which is marketed at a very reasonable price.

While there are different kinds of molasses, authorities are agreed that the safest variety is the original sugar cane molasses, and that its effect on horses and other stock is highly beneficial.

One of the most important uses of sugar cane molasses is for the disposal of poor quality hay and feed which would ordinarily be left uneaten. It is usually the most practical way of making feeds palatable and digestible. The usual method is to thin the molasses with water so that it runs as freely as cream and to pour it over dry corn fodder straw or old hay. A sprinkling can with the hose enlarged often proves very handy. Some find it well to grind up their roughage and mix the molasses with roughage and grains. This is the best method, for besides the grain which may be substituted pound for pound to that of molasses the roughage also replaces much of the grain. Horses are ordinarily fed from two to six pounds per day, according to the amount of work required from them. In the lumber camp the use of molasses might be studied to advantage.

Canadian Timber Will Have to Wait

As a result of the congestion at British ports, the bulk of the British Government's large purchase of timber from Canada will have to wait for shipment until 1920. There has been much criticism, especially on the part of the British timber trade, of the method of Government importation. One prominent trader stated recently that "huge quantities of spruce and other Canadian goods have been purchased, partial shipment of which has added to the dock congestion, conditions being now at such a pass that the shipping department is at wits end to know where to find a dumping ground for the vast quantities remaining unshipped."

From Farmer Youth To Captain of Industry

How J. D. Irving, New Brunswick Lumberman, Has Developed Business From Small Sawmill into Large, Prosperous Activities with Wide Markets

J. D. Irving started in the lumbering line in a small way in Buctouche, N. B., over forty years ago. He moved in from a farm to the village and had practically no means, but by industry, perseverance and foresight worked up the business to its present large proportions, with extensive factories and mercantile buildings. Nearly two years ago Mr. Irving converted his organization into an incorporated company, with a federal charter, under the style of J. D. Irving, Limited, of which he is president; J. H. Irving as manager, and K. C. Irving, (both sons) taking an active part in the business, which has increased from the original, small sawmill to large, general enterprises of logging, lumbering, box factory, farming, flour mills, cold storage, fish, oysters, produce and general merchandise.

Any measure of success that the founder has met with he attributes to the fact that he was always open to talk matters over with his employees; several of whom have been in the service thirty to forty years. "It is like this," declared Mr. Irving: "We figure that if a man can make a few extra dollars for us each week he is entitled to, at least, one of them, and this applies to the man working with pick and shovel as well as the foreman on the job. We believe in co-operation and also forwarding the interest of the country at large as we cannot very well exist without neighboring industries, although they might possibly get along without us."

The annual output from the saw mills is from three to four million superficial feet. The greater part of the lumber was exported to Europe before the outbreak of the war, but since then the majority of it has been disposed of locally. During the early stages of the European strife Buctouche ranked seventh so far as New Brunswick ports are concerned in the shipment of forest products overseas. The company now prefer selling their annual cut in local markets as much as possible, even at a slightly lower figure, as they are of the opinion that every dollar that they can have spent locally in manufacturing the finished article means that much more money in circulation at home, and it is on that that they depend to a greater or less extent for their future business.

J. D. Irving, Limited, have always been great boosters for the province of New Brunswick in general and Buctouche in particular. The latter village is on the Buctouche river, about five miles from its

mouth. It is a good port for shallow draft vessels, the port being land locked with about fourteen feet of water on the bar. Inside of the bar there is a bay seven by five miles, with an abundance of water in which abounds the Buctouche Bay oyster, one of the very finest of eastern bivalves. The sawmills and piers of the company, including the railway terminals, are located about five miles from the mouth of the river, which is navigable for several miles. The headwaters are well wooded with spruce, hemlock and a sprinkling of hardwoods. The wood in that vicinity is both plentiful and suitable for timbers for vessels of four to five hundred tons. The company are hoping that shipbuilding operations will open up again at this point as during the past generation there were several shipyards along the river.

ary and band resaw and the usual accessories and the output is from forty to fifty thousand feet a day. There is also operated a box mill so as to save all possible material. The logs came principally from the granted and leased lands of the firm, of which they hold a considerable acreage. All the timber is within a short haul of the rivers. The Irving company operate their own camps, and this winter will increase the cut of spruce, fir and hardwoods on their limits.

Lumber is manufactured for both export and local trade into different widths and sizes from timbers to laths including kiln dried stock from their own dry kilns where sheathing and hardwood flooring are also dried. The box plant has a capacity of one thousand cases a day and is kept in constant operation, most of the boxes being manufactured from heavy slabs. This industry was originally started

mouth. It is a good port for shallow draft vessels, the port being land locked with about fourteen feet of water on the bar. Inside of the bar there is a bay seven by five miles, with an abundance of water in which abounds the Buctouche Bay oyster, one of the very finest of eastern bivalves. The sawmills and piers of the company, including the railway terminals, are located about five miles from the mouth of the river, which is navigable for several miles. The headwaters are well wooded with spruce, hemlock and a sprinkling of hardwoods. The wood in that vicinity is both plentiful and suitable for timbers for vessels of four to five hundred tons. The company are hoping that shipbuilding operations will open up again at this point as during the past generation there were several shipyards along the river.

The sawmill of J. D. Irving, Limited, is equipped with a rot-

ary and band resaw and the usual accessories and the output is from forty to fifty thousand feet a day. There is also operated a box mill so as to save all possible material. The logs came principally from the granted and leased lands of the firm, of which they hold a considerable acreage. All the timber is within a short haul of the rivers. The Irving company operate their own camps, and this winter will increase the cut of spruce, fir and hardwoods on their limits.

Lumber is manufactured for both export and local trade into different widths and sizes from timbers to laths including kiln dried stock from their own dry kilns where sheathing and hardwood flooring are also dried. The box plant has a capacity of one thousand cases a day and is kept in constant operation, most of the boxes being manufactured from heavy slabs. This industry was originally started for the turning out of boxes for the fresh, frozen and smoked fish of the company and barrels for their oyster and potato trade, but has rapidly increased in capacity. Boxes are now produced in any dimensions or style, from the rough to matched kiln-dried boxes, which are put up, either plain or printed, and used principally for fish boxes for export, including bloaters, finnan haddies, lobsters, etc. The company are also manufacturers of boxes for other purposes such as dry goods, biscuits, etc. Their barrel staves and heading, made up for slack barrels only and shipped knocked down, are used chiefly for shipping potatoes, etc., to the West Indies, calcium plaster and rock wall plaster to the United States and European markets, and oysters (Buctouche Bay), of which the firm are very proud, to the Canadian markets. Some staves are shipped west and to the Ontario market for apples and other purposes.

J. D. Irving, Limited, have a water front for their saw mill capable of handling two small trans-Atlantic vessels, with a draft of about thirty feet of water. For rail shipments they have a spur on the Canadian National Railways along the face of their upper wharf which has accommodation for three trans-Atlantic vessels of about twenty feet draft. At the upper wharf there is also located the freezer and cold storage plant, which is a building with a floor space of eight thousand feet used for frozen fish exclusively, and adjoins the general store, offices and produce warehouses of the company. Some idea of the extent of the factories and buildings of the company may be gauged from the fact that it requires 135,000 square feet of Neponset Paroid roofing to cover them.

Speaking of the future of the lumber industry, Mr. Irving says that with the present outlook of the steel situation and the generally unsettled condition of world affairs, he is looking for a strong demand for eastern forest products and believes that the trade will be better next year than it has been in the past. Relating to logging and costs of operation in the camp he adds: "These are about 20 per cent. above what they were last year—that is, with respect to wages in our lumber mills. The cost of equipment has gone up from 25 to 50 per cent., and provisions in proportion, during the last few years. The cost of camp supplies has increased about 10 per cent. and we do not anticipate any drop.

Sawmill Waste is Really Appalling

Angus McLean Says That it is Great Economic Loss
Which Should be Corrected Speedily

We must be satisfied with nothing less than absolute safety from fire in our forests.

Our waste and unproductive forest lands should be reclaimed and set to growing timber.

Our cutting should be so regulated that there would be no usable material whatever left in the woods when cutting is done.

Our waste in the saw milling eliminated until not even a grain of saw dust will be burned for naught. All material at the saw mills that is not usable in some form may be used as fuel to create power.

This is the summing up of a general lumbering review of New Brunswick and Nova Scotia by Angus McLean, general manager of the Bathurst Lumber Co., Bathurst, N.B., in a recent article in the "Busy East," in which he contends that forest fires should be stamped out, waste lands reclaimed for tree growing, extravagant practices of sawmills discouraged, and the establishment of pulp and paper mills fostered, in order that the maximum values from the forests may be secured.

Mr. McLean says: I am, of course, familiar with conditions prevailing on the north shore of New Brunswick, but conditions vary but very little in the whole of this province and they are also very similar to conditions prevailing in Nova Scotia.

In this country we are not subject to any serious forest fire hazard and with any kind of ordinary care we should completely abolish this hazard. This condition is due to the fact that we have a heavy precipitation here during the periods that are usually dangerous for fires. Then we invariably get early snows and they cover the ground in the woods usually up to the 1st of May, and in the thick forests very often up to the early part of June. By that time the green undergrowth in the woods is up and covers the ground so that fires do not run. Our experience of ten years here has been so uniformly satisfactory in this respect that we are quite satisfied we are practically at the point where we will absolutely eliminate this hazard. We have had a few minor fires in our woodlands, but they have always been extinguished before much if any damage was done, so that our loss from bush fires covering this ten year period has been practically nil. What fires have taken place were invariably started by some settler burning up his slash without proper supervision. Our Minister of Crown Lands, Dr. Smith, has taken the necessary and proper steps to stop this hazard and regulate the burning of all slash in the future, and we are convinced he will succeed.

Most of our woodlands have a thriving growth of young timber on them, but we have some areas of bog and burned-over territory which should be receiving attention and prepared to produce timber, as most of our lands are not fit for farming and are only suitable for growing trees. The bog lands ought to be drained and the old burned-over lands, of many years standing, put into shape that young trees could grow on them. This requires some attention from a practiced forester. Apart from these above-named lands our timber reproduces itself without any artificial effort whatever. Please remember that these burned-over areas are of long standing, and they were largely caused by hunters who claimed they needed open areas in the forest in order to get game as the moose and deer could not be successfully hunted in the dense growth.

Next and one of the most important matters is the cutting of timber. This, of course, is done under government regulations when cutting timber in our forests. There has, however, been very great loss caused in cutting timber in our forests here in the past, owing to the small trees cut in yarding and making roads being allowed to remain in the woods to rot and also when trees are felled too much timber is left at the stump in way of butting and large tops. Am quite sure fully one quarter of the trees has been wasted in this way in the past. Of course in the ordinary course of lumbering for sawn lumber only, it is not feasible to take out the defective butts and small tops profitably, but these can all be used profitably in the pulp and paper industry and this is in the line our Provincial Government should devote some time to, and encourage these establishments in every possible way.

Next, the waste at the sawmills in New Brunswick and also in Nova Scotia is really appalling. Every mill in the land has either a steel incinerator or an open burner, into which thousands of cords of good material are being dumped and burned up annually, causing a serious loss of good raw material which should be utilized, and depriving many men of work to fit this material for the market. This is a great economic loss which should be very speedily corrected. In New Brunswick alone, hundreds of thousands of dollars are lost in this operation annually.

Another matter that is worthy of serious consideration is the

manufacturing of our lumber and other products from wood into as near as possible the finished products at home. Too much unfinished raw material is being shipped out of the country on which needless cost is entailed in the way of freight charges and our country is deprived of the expenditure of labor to convert.

Winnipeg Wholesalers Elect Officers

G. U. Bacon, of the Great West Lumber Co., was elected president at the recent annual meeting of the Winnipeg Wholesale Lumbermen's Association; R. Westcott was appointed vice-president, and A. Scoville, sec'y-treas. The directors elected were: B. B. Sprague, Mark Watson, W. B. Tomlinson, W. E. Allan, F. J. Chapman.

A number of important matters were considered at the gathering, and a hearty vote of thanks accorded E. C. Carter, the retiring president, and the other officers for their faithful and efficient services. It is expected that considerable new work will be carried out by the

G. U. Bacon, Winnipeg,
Newly-elected President of the Association

new officers and there is no doubt the Association has been of much practical benefit and help to the industry.

Among the matters discussed during the past year were a uniform set of purchase terms and also the effort to have an inspector appointed at Winnipeg for adjustments of claims and shortages so that these matters would not have to be attended to by anybody except an independent party acting in the best interest of all concerned. This inspector has not yet been appointed but the matter is still being negotiated. A sales department was operated for some time during the past year with the idea of moving surplus stock but owing to the very unsettled conditions the department was discontinued for the time being.

There was a good attendance of members at the annual meeting of the Western Retail Dealers' Association at Calgary, and a great deal of good work was accomplished at this convention.

A credit rating department was established to give members first hand information regarding credit matters they were interested in and this department is conceded by all who make use of it to be a great help along the lines for which it is intended.

The past year was a hard one on the different members of the association. At the time of the influenza epidemic, while the association did not lose any members, several of them lost relatives and the association did whatever it could to express their sympathy in these sad cases. Later on in the year the notorious strike caused considerable disruption in business when all the members put business in second place and did everything to help support constituted authority to the best of their ability.

Erection of Mill Cut Houses in England

According to recent press advices from England regulations are soon to be issued by the Ministry of Health to overrule the local building by-laws, and will open her new field for Canadian enterprise, permitting the erection of mill-cut houses. This step is taken to relieve the housing situation. A Canadian timber man here says that the transport of mill-cut houses from Canada to Britain is too expensive, but is a large possibility. A Canadian firm which manufactures from Canadian finer timbers, is using the Baltic woods for rougher parts and accessories. It is also purchasable cheaper here. He believes this plan will allow manufacturers to cost little in excess of the Canadian price.

How Transit Car Problem is Viewed by Trade

The Practice is Growing Rapidly and Said to be Responsible for Transportation Congestion—Pros and Cons of Perplexing Question Presented

For many years it has been the practice for individuals or companies to load up lumber or shingles and start them en route to some railroad centre with the hope and expectation of being able to sell the material before it reached its destination. There is no topic of conversation over which there has been so much animated argument or so radically different views expressed as this so-called transit car problem, declares the "Mississippi Valley Lumberman."

A few manufacturers make a specialty of marketing the output of their mills through this method. As a rule, however, a great majority of the cars sent in transit are owned or controlled by wholesalers, brokers, or jobbers, who guess or gamble that prices will be higher at the time their material is ready to be delivered than they paid for it. Some of this class are mere middlemen who are used by certain manufacturers to secure the advantage of current market prices by putting stock in transit.

Some Stoutly Champion the Method

Those who make a specialty of buying, handling or selling transit cars stoutly champion this method of supplying the trade, claiming that it is more satisfactory, economical and preferable than the slow method of waiting for mill shipments. They further claim that by inducing or forcing the trade to take what the producer has, rather than what the retail distributor wants, constitutes good salesmanship. They defend the liberal bonus which they sometimes extort from those in urgent need of stock, by pointing to the chances they are taking and the loss they must assume on certain other transactions. The champions of the transit car take the position that those who own or control any forest product have a legal and a moral right to do as they please with it. The manufacturer having sold it has no further interest in it; the retail lumbermen or consuming trade do not have to buy it unless they want to. They insist that orders which they place with the manufacturer should be given the same consideration as that received from any other buyer. Further, that if they are willing to take such stock as the manufacturer has available and pay him a hundred per cent. of the invoice on receipt of bill-of-lading, the manufacturer would be very short-sighted and they would be unjustly treated if the material was not turned over to them. One reason they claim why they get the stock is that the dealers are not willing to do business on the same terms as they do.

On the other hand, the large majority of manufacturers condemn the shipping of material in transit. From undisputed records they show that the principal reason why periods of prosperity and high prices for forest products have been suddenly or gradually changed to conditions of depression and low prices was due, almost entirely to dumping of material on the market in excess of what the trade could assimilate. They claim that the radical fluctuation in the prices of material in transit has a tendency to encourage the dealer to hold off placing his order for future requirements. This often results in a congestion of business which is not desirable from the standpoint of the producer, and exceedingly detrimental to that of the retail distributor; that the whole tendency of sending material in transit is to keep the market constantly upset and prevent a normal, steady demand, and a stabilizing of prices which is to the best interests of both the manufacturer and retail distributor.

Strong Condemnation of Transit Cars

The retail lumbermen generally are inclined to side with the views of the manufacturer. They realize that, if rightly controlled, a certain amount of forest products, especially shingles, might be kept in transit so as to supply unexpected and urgent demands. The dealers, however, point out that, as a rule, the character of the lumber included in a transit car seldom meets their needs or requirements. In a large majority of cases where they are compelled to resort to transit cars, they are forced to buy as much or more undesirable or unsaleable stock than they get of the material they must have. They admit that occasionally they do get some bargains, but that more often their urgent necessities are taken advantage of by those who have cars in transit; that prices are not regulated so much by the character of the stock as by the proximity of the car to its destination.

The retail lumbermen generally are disposed to credit the transit cars with being largely responsible for delayed shipments. They openly accuse the manufacturer of taking the material which should be used in filling orders accepted weeks or months ago to use in

making attractive cars of lumber which are sent forward in transit. Through this means they secure the benefit of the high prices, while the dealer not only is deprived of the material which belongs to him, but, in addition thereto, forced to take a lot of unsalable stock.

The practical railway operators bitterly denounce any system which will permit the dumping on them of an unlimited number of cars of forest products, without any definite information as to what disposition is to be made of this property. Just now there is a shortage of cars for definite business, and the transit car practice prevents the use of equipment for this purpose.

On an average, fifty cars of so-called transit material was received at the Minnesota Transfer each day during the month of September. These cars are shuffled back and forth in the switching yards in order to get out, and send on to their destination, those cars which have been re-consigned. On the average, these cars will remain in the possession of the transfer companies for six or seven days. Some of them, however, remain on demurrage several weeks. To-day there is one car which was received the 25th of August, while there are at least a dozen which came in all the way from the first to the fifth of September. The railroad regulations provide that the consignee has two days' free time to unload. A demurrage charge of \$2.00 is assessed for each of the next succeeding four days, and a heavy penalty of \$5.00 for each and every one of the days thereafter, where the car is undiverted or unloaded.

Information received from railroads and other sources indicates that the number of transit cars which are leaving the coast and are passing through certain gateways on the transcontinental lines is more for the last week than for any similar period for months. This is surprising considering the fact that there is supposed to be a pronounced car shortage on the Pacific Coast.

Would Stop Indiscriminate Practice.

In regard to the use and abuse of cars in transit, Horace F. Taylor, of Buffalo, N. Y., president of the National Wholesale Lumber Dealers' Association, whose headquarters are in New York, has sent to the members the following letter which will be read with interest, particularly at this juncture when the annual congestion of traffic at terminal points and the shortage of cars is looming up:

This important matter will shortly be taken up at a conference between the Railroad Administration and wholesalers, manufacturers and retailers with the purpose of cutting out such abuse of the privilege as exists. Our association has an unusual opportunity to be of service to all concerned if we can be successful in proposing a restriction which will preserve the trade necessity of diversion and prohibit its abuse.

You are urgently requested, therefore, to promptly submit your definite views (1) as to retention of present regulations, (2) prohibition of the privilege, or (3) such modification as you would recommend. If time permits before the date of conference, these views will be summarized by your Trustees or Executive Committee for the use of our Railroad and Transportation Committee, to whom the matter has been referred.

This is not a new matter to our association; for six months or more, it has been the subject of conference and correspondence with the authorities, and at our March meeting, the following resolution to which your attention is again called, was unanimously adopted by vote of wholesalers and manufacturers alike.

"RESOLVED: That we condemn the practice of making indiscriminate transit car shipments of unsold lumber and other forest products, as tending to the demoralization of market conditions, it being understood that this resolution shall not be construed as opposing a proper use of the re-consignment privilege."

"If we should begin to-day to protect our cut-over land from fire and to use wholly practical methods of forestry to secure reproduction after logging, we could secure in the next 50 or 60 years an annual production of over 60,000,000,000 feet a year without lessening our forest capital. And this would be done without devoting to tree growth land that is not chiefly valuable for that purpose," declared Henry S. Graves of the United States Forestry Service, in a recent address.

Price Brothers Celebrate Centenary

Historic Quebec Firm Has Made Splendid Progress in
Lumber, Pulp and Paper Activities

Sir William Price,
Head of the present large organization

The nationally known firm of Price Bros. & Co., Limited, of Quebec, who have pulp and paper mills at Kenogami, Jonquiere and Rimouski, and saw mills at more than half a dozen points in Quebec, recently celebrated the one hundredth anniversary of the founding of their business.

The company are large manufacturers of spruce lumber, lath, cedar shingles, ties, pulpwood, sulphite, and groundwood pulp, newsprint, cardboard, etc., and are one of the most prosperous and progressive organizations on the continent.

The significant and historic event was commemorated by a private gathering held at Kenogami where the big paper mills of the company are situated. About 150 old employees of the firm were invited to attend and it

would have afforded Sir Wm. Price, head of the concern, much delight to have included many more but lack of accommodation made it necessary to limit the number. A special train on which were the invited guests left Quebec on August 26 and all the establishments of Price Bros. were represented. At Kenogami the party were joined by representatives of that busy centre and from Jonquiere. The trip was a most interesting and impressive one and many were the happy incidents recalled, the historic associations revived and hearty well wishes showered upon the head of the firm for the continued success and expansion of the aggressive company.

The company are now installing a new newsprint unit at Kenogami and erecting a new saw mill at Matane. Since 1900 the industrial operations of Price Bros. have increased fivefold and before another ten years elapse, it is predicted that they will be among the largest, if not the largest, producers on the continent of newsprint, groundwood pulp and lumber. The founder of the business was the late Wm. Price, grandfather of Sir William of the present day, and the year was 1817.

This young man arrived in Quebec in 1810 from Elstree, Hertfordshire, England, at the age of twenty-one years. Europe was then in the midst of the wars of the Empire and under the shock of the decree of Berlin issued by Napoleon establishing the continental blockade. Some time afterwards the United States issued the decree of the Embargo prohibiting American vessels from leaving their ports and communicating with England and France.

Access to the Scandinavian countries interdicted and the United States refusing to trade with her, England decided to send a representative to Canada to purchase wood for masts which the Admiralty required.

After having fulfilled his mission William Price started on his own account a lumber business. His first operations were made on the Ottawa and the St. Maurice, but he principally applied himself to develop his industry on the south side of the St. Lawrence, from Riviere Du Loup to Matane, and afterwards to the Saguenay.

About 1850 he covered the region of Quebec with his saw mills and hundreds of vessels traversed the seas of the world loaded with products from the William Price Quebec industry. He had then industrial establishments at the following places:

Hadlow, Batiscan, Riviere du Loup, Isle Verte, Bic, Rimouski, Metis, Tartigou, Riviere Blanche, Matane, Cap Chat, Papinchois or Bersimis, Sault au Cochon, Escoumains, Bergeronnes, Moulin Baude, Tadousac, Baie des Rochers, Riviere Noire, Petites Isles, Petit Saguenay, Anse St. Jean, Anse a Pelletier, Grand Baie, Chicoutimi, Riviere du Moulin.

From his marriage with Jane Evan there were 14 children, seven boys and seven girls. He died on the 14th of March, 1867, at his residence "Wolfesfield," St. Louis Road, Quebec, at the age of 78 years surrounded by his children and enjoying the respect of his fellow-citizens.

At this time his three sons, William, David and John, were his partners and practically managed the business. William died on the 12th of June, 1880, at the age of 53 years, while he was a member of the Quebec Legislative Assembly. David died in 1883. He was senator for the Laurentide Division. Before Confederation he had been

elected Legislative Councillor for the same Division. The Honorable John succeeded his brother in the Senate and died in the month of August, 1899.

The estate of William Price, Sr., as well as the estates of his three sons, David, William and John, became the property of William (Sir William), younger son of Henry, by the will of his uncle, Honorable John Price.

Apart from large cash bequests that he directed his legatee to pay, the Honorable John Price, by his last will and testament, wished to keep intact under one head the large estate of Price Brothers, following therein the policy of his father and brothers who predeceased him, with the evident intention of more effectively continuing the work begun in 1817 in the Province of Quebec.

Sir William inherited the estate of his uncle at a relatively early age and assisted by his brothers Henry and Arthur undertook the heavy burden of directing a large firm which experienced hands had hitherto managed.

He renewed the mills which had somewhat deteriorated in nearly all the establishments and about 1900 launched into the new pulp and paper industry without, however, neglecting the old industry of sawn timber. From 1900 until now the industrial operations of Price Brothers under the inspiration of the young heir have increased fivefold. Not only has Sir William maintained in the commercial world the name of his ancestors as lumber merchants; but he has put his Company in the foremost place of the country's great paper manufacturers.

With the new developments which are being provided the Price Company will attain in the manufacture of paper, before ten years have elapsed, first place on the continent. People asked with anxiety after the death of John Price what would become of the Price fortune amassed from father to son in the hands of the young man then called Willie Price.

His uncle had prudently trained him to the work, it is true, for close onto ten years under his supervision and direction, but what would this young man full of life do with these estates that sudden fortune invited to dissipation? Would he take the profits only with the pleasures without also assuming at the same time the heavy moral responsibilities of his new position?

A great many young men would have succumbed to the temptations of the easy life with its pernicious influence under like circumstances.

The young man did not lose his head, he remained steadfast at his post and showed himself worthy of the confidences of his uncle and the intrusted deposit has been kept with the greatest care.

Statistical Returns Make Fair Progress

In regard to the members of the Canadian Lumbermen's Association furnishing statistics of lumber production, sales and shipments, etc., each month and sending the same to the Secretary of the C. L. A. for tabulation in order that a better estimate of trade activities in general might prevail, it is learned that the process of carrying this out has been a little slower and more tedious than at first anticipated, when such a step was decided upon at the annual meeting of the C. L. A. held last February in St. John, N. B. Like the current of a river, this movement is expected to gather strength as it flows, and it may be necessary to carry on an education campaign for some time, such as was conducted in the Southern Pine trade for several years, before the statistical department of the Canadian Lumbermen's Association can accomplish much in the way of practical results. The Association is determined to "carry on" in this regard and believes that each month will see greater co-operation and united effort.

An Employment Bureau For Loggers

Recent advices received from B. C. state that prominent employers in the logging and timber camps of the Province have decided to open an employment bureau in Vancouver where men will be given work without having to pay a fee. There will be a job for every man, and if at the time of his application there is not a position available, one will be found for him. The employers intend in the first place to look after the interests of Canadian and British-born loggers, especially the returned lumbermen who are anxious to take up their former occupation. Recently there were eleven camps in the Province closed down, six through strikes and the remainder from other causes. It is estimated that there are approximately 1,200 loggers affected by reason of the strikes and the shutting down of the various camps in B. C.

John Readhead died recently at his home in Lowville, Ont., at the advanced age of 85 years. Mr. Readhead followed the lumber business for a long period and was well known.

Should View Present Conditions as Normal

Unbiased Study of Whole Lumber Situation Convinces Representative Committee

Prices Will Not Fall—Structural Undertakings Should Not be Delayed

Some exceptionally thorough investigations into the lumber price situation in the United States have been undertaken of late, with results that are of much importance to the trade. It was to be expected that the public would harbor doubts about the necessity for increased lumber prices under conditions which have recently developed, similar to the doubts that have arisen regarding advances in many other lines. The result has been several government enquiries.

Probably the most unbiased study of the situation, so far as lumber is concerned, has been made in the State of Illinois. A few months ago, when the State of Illinois was considering the construction of many needed buildings, and how to promote the erection of much important and necessary private construction, there was a general contention that the prices of building materials were too high. Those who were not connected with the manufacture of building materials had an idea that prices would greatly decline during 1919, and that those who spent money on building operations would be losers. The State, therefore, decided to appoint a disinterested body of public men to investigate the situation and make the facts known. A committee was appointed, consisting of ten lawyers and prominent business men. They investigated and heard evidence for two months, prying into building material prices, production costs and the conditions of supply and demand. Their conclusions are very striking and important.

The Relative Value of Lumber

The following extracts from their report are interesting to the lumber trade:

"The public mind, in starting building and construction operations, is influenced almost solely by prices of what may be termed the basic building materials to wit: Steel, lumber, cement and brick.

"This committee attempts to analyze the price of lumber not alone from the standpoint of cost as represented by several constituent parts, but from the standpoint of its relative value."

"The price of one thousand feet of lumber purchased

In 1913	In 1917
23.4 bushels of wheat	12.4
35 bushels of corn	16.3
290 pounds of hogs	180
201 pounds of bacon	109
10 barrels of apples	8.5
190 pounds of cotton	133
328 yards cotton sheeting	216
1949 pounds of steel	1725

"It must be remembered that the price of these other commodities continued to soar higher through 1918, while the price of lumber was not only held down, but reduced by the Government.

"Stumpage and timber values in this country will, in the opinion of the commission, increase materially, not alone because of the great demand for lumber, but because of the fast diminishing supply.

"The lumber situation is international in its scope. There is a world-wide demand, but only limited fields of production.

"With over twenty million acres of timber destroyed by artillery fire; or burned for strategic purposes during the world war; with Russian sawmills dismantled, stripped of all machinery which the Bolsheviks sold to the Germans, and with general industrial chaos throughout Russia, Canada and the United States will be called upon to supply most of the lumber used through the construction period.

"With the demand far greater than ever before, it is the opinion of this commission, that lumber prices will go up rather than down.

England's Guarantee Against Lower Prices

"Roger E. Simmons, of the U. S. Trade Commission, Department of Commerce, who recently returned from an investigation for the Government of the timber and lumber conditions in Russia and England, testified to the fact that England was so sure that lumber prices would increase that the Government is making a guarantee to private builders, if they go ahead and build now, that if in five years the price of lumber, material and construction has come down,

the Government will pay 75 per cent. of the difference to the builder and investor. He further testified London trade papers, as well as the general press, already are printing articles concerning what they call a timber famine.

"On account of this world demand for lumber, there will be many attempts, no doubt, to encroach upon the Forest Preserves of this country. Such an encroachment, unless limited, would rob the future generations of their rightful heritage. It would be a public menace. It would endanger our entire national conservation policy.

"The commission is unable to see how the cost of labor in the manufacturing of lumber can be materially lowered so long as the cost of living remains at its present level.

"The commission is obliged to report that the record contains no evidence showing that illegal agreements for the reason of profiteering exist in any of the businesses investigated by the commission, subject to certain observations regarding cement."

Advises That Building Should Go On.

Among the recommendations made by the committee to the public is the following:

"In view of opinions expressed in this report, we believe it to be our duty as public officials, to advise the public not to delay building projects in the hope that prices will come down materially. We do not believe they will. We deem it the part of wisdom to accept present conditions as normal and that building operations should be based upon that principle. All contemplated buildings, homes, and improvements should be started now. Reconstruction can only be accomplished in its real sense by every citizen subscribing to the doctrine 'buy now, build now!'"

The important fact to bear in mind in connection with the above report is that after the expenditure of several thousand dollars and two months' time, this body of intelligent, able men have become informed, have reversed their former opinions and have been convinced. Their advice means much to those contemplating construction.

Small Export Trade in Lumber

Only 3.1 per cent. of the total lumber production of the United States was exported in 1918, according to recent Government figures, which prove how unfounded is the statement reported to have been made by a prominent forester that "the forests are being drained to support foreign factories."

In 1918, the Government figures give somewhat more than one billion three hundred million feet of lumber as exported out of an estimated production of 32 billion feet. Of these exports about 110 million feet was in railroad ties, not quite as much in hewn and sawed timber while over one billion feet was in the form of boards, planks and deals.

Figures for the first three months of 1919 show only a slight increase in value of lumber exports over the monthly figures of the last half of 1918. For April, May and June, 1919, the exports are greater, the increase in value being about 40 per cent over the average value of 1918 months. But even if the entire year of 1919 shows an increase of 40 per cent., which is extremely unlikely—June, 1919, exports of merchandise were the peak and July figures were 30 per cent. lower—but even on this extreme supposition, the total lumber exports for 1919 would be less than two billion feet out of a total predicted production of 32,000,000,000 feet or about the equivalent of the 1918 yield.

Want Some Return From Timber Dues

A well-attended meeting of the Huntsville Board of Trade and the residents of Dwight and vicinity, was held recently to discuss the possible method of improving the roads. The fact that the Ontario Government has secured hundreds of thousands of dollars from the district in timber dues, it seems only just that some return should be given this locality. Petitions were therefore prepared asking the Colonization Department to appropriate a sufficient sum for road improvements, especially on this much travelled highway.

Progressive Lumber Co. Expanding

Live Prairie Province Organization Will Greatly Increase Output and Install New Equipment

The Finger Lumber Co., Limited, of The Pas, Manitoba, intend putting in four logging camps during the coming winter and will employ about six hundred men. The company state that wages are running from \$55 to \$75 per month and help is hard to get even at this figure while camp supplies are costing from 100 to 150 per cent. more than they did before the war. The company will increase their mill capacity and are installing a new band resaw and trimmer and also a new band mill.

The Finger Lumber Company, of which H. Finger is president, H. S. Smith vice-president, and W. H. Miner, secretary-treasurer,

General view of the Finger Company's plant

commenced operations in the Spring of 1912, and own extensive timber limits along the Saskatchewan and the Carrot rivers.

Their logging thus far has been conducted on the limits along the Carrot river, where a number of camps last winter were operated. The logs are driven down the Carrot river into a storage boom located where the river empties into the Saskatchewan. They are then towed from this storage boom to the saw mill by the company's own tugs.

The company are the pioneers in the lumber industry in Northern Manitoba, that vast stretch of land hitherto considered as the

Tugs of Finger Lumber Company at work on the river

frozen hinterland. With the advent of the Hudson Bay Railway the so-called frozen waste is now considered the richest part of Manitoba.

The capacity of the plant now is 25,000,000 feet annually and the output is mostly spruce, there being only a sprinkling of cottonwood and tamarac. Carrot River spruce is considered high quality; has fine texture and compares favorably with white pine. The lumber is hauled from the sorting works to the yard by rail, and the planing mill is equipped with modern fast-feed machines and resaws.

The company operate their own electric light plant, and the motive power for both the sawmill and the planing mill is steam. Most of the company's product is marketed in the Prairie Provinces, but

during the last few years it has developed a market in the United States. The Pas is the western terminus of the Hudson Bay Railway in Manitoba.

Retailers Resent High Cost Allegations

At a recent meeting of the Chamber of Commerce in Sarnia, Ont., one of the speakers was James Dunn, a contractor from the neighboring city of Port Huron, Mich., and, in the course of his remarks, he is reported to have said that the high prices of lumber in Sarnia had kept building back. This statement has not been well received by the retail lumbermen of Sarnia, who naturally are indignant at the observation and have not been backward in letting their opinion be known, for the impression was conveyed that the public had been "held up."

C. H. Belton, of the R. Laidlaw Lumber Co., remarked that the assertion was absurd and utterly uncalled for, and, according to a recent press despatch, intimated that a suit for damages might be heard in the near future.

John McGibbon of McGibbon, Limited, also entered a protest at the figure quoted by the Port Huron contractor, and stated that all the season lumber had been from five to twenty-five dollars per M. cheaper in Sarnia than in adjoining centres. It is said that the last has not been heard of the allegation and the question will be taken up at the next meeting of the Board of Commerce.

Schroeder Co. Buy Lauder-Spears Mill

The Schroeder Mills and Timber Co., Pakesley, Ont., have bought the Lauder, Spears and Howland sawmill which is located on the Lost Channel at the foot of the Pickering River and intend operating the plant next season. The mill has direct connection with the C. P. R. at Pakesley by means of the Key Valley Railway, which is a standard gauge road, twelve miles long. Pakesley Station is located 206 miles north of Toronto. The Lauder, Spears & Howland plant, when fully completed and the second unit installed, will have a sawing capacity of 100,000 feet to 125,000 feet a day. The lumber as it is cut will be brought to Pakesley to dry.

In speaking of logging operations for the coming season James Ludgate, Ontario manager of the Schroeder Mills and Timber Co., says that in camp supplies the prices are about the same as last season. Beef is cheaper but dried fruits are dearer. Feed for horses is ten per cent. above what it was a year ago. Labor is more plentiful but not as sufficient as it might be, and many young lads, that should be at school, are roaming around looking for work. Mr. Ludgate states that the returned soldiers are in evidence everywhere and just like they were before the war—nearly all good men—a little more reckless perhaps than they were but this, he believes, is natural, as economy was not one of the things practiced to excess during the European conflict.

The Schroeder Co., who contemplated paying their men by the day system and inaugurating it this fall, have not done so owing to the fact that there appears to be a great deal of labor unrest in the country. They consider it an inopportune time to enter upon anything new.

Rock Creek Co. Get Timber Limits

The Rock Creek Lumber Co., of Flagstone, B. C., have bought the timber holdings located at Crow's Nest from Malcolm McInnes, of Calgary. It is said that the consideration was around \$200,000. The limits comprise twelve sections of valuable saw timber and large quantities of mining props and poles. The estimated cruise of the timber runs well up into the millions of feet exclusive of the smaller timber, which can be manufactured into props, etc. The Rock Creek Lumber Co., intend to operate very extensively and are already engaged in reconstructing the sawmill, which has been idle for some time, so that when completed it will have a capacity of about 50,000 feet B.M. per day. They are also constructing a large flume which will be supplied with water from Alexander Creek, formerly known as the North Fork of Michel Creek, and by this means the logs will be conveyed from the limits to the mill during practically any season of the year, and thus insure a permanent supply of saw timber for the mill. Camps as well are being built in the limits and roads laid out.

An Echo of the Election Contest

Major Hartt, lumberman of Orillia, who was M.P.P. for East Simcoe, has issued a writ against R. H. Halbert, president of the U. F. O., claiming \$10,000 damages because defendant on Aug. 14, at a farmers' meeting at Barrie, "recklessly, falsely and maliciously" charged Hartt with having said at a meeting in North Bay, that "farmers remind me of a lot of hogs feeding at a trough, and, after they are full, still squealing for more." Major Hartt asks for an injunction to restrain Halbert from repeating the statement.

Personal Paragraphs of Interest

York Long, managing director of Cox, Long & Co., Liverpool, is on a business visit to Canada.

John H. Cole, of Knight Bros. Co., Ltd., Burk's Falls, Ont., spent a few days in Toronto recently calling upon the lumber trade.

Frank W. Gordon, manager of the B. C. forest products department of Terry & Gordon, Toronto, left recently on an extended business trip to the Coast, where he will spend several weeks.

L. D. Barclay, of Toronto, eastern manager of the Canadian Western Lumber Co., Fraser Mills, B.C., who was confined to his home for several days with illness, is once more at his desk.

J. B. Knox of Knox Bros., Montreal, has returned from a brief visit to the Pacific Coast. He reports that business continues very good, with a strong market.

H. J. Terry, of Terry & Gordon, Toronto, has returned from a holiday trip to Winnipeg, Minneapolis and Chicago. He has not been feeling up to the mark for some time, but as a result of his outing, is much improved.

R. McDonagh, of the firm of Hart & McDonagh, wholesale lumber dealers, Toronto, who has been confined to his home for some time owing to an attack of inflammatory rheumatism, is able to be at his office again.

The name of the British Government Timber Buyer has been changed to that of the Imported Lumber Disposal Section, Board of Trade, London, England. Mr. S. C. Denman, Montreal, is the representative in Eastern Canada.

Sidney R. Anderson, of Toronto, who is a well known lumber salesman, has opened an office in the Manning Chambers, Queen St. West, Toronto, and embarked in the wholesale lumber line. He will handle both hard and softwoods.

A. G. Richardson, the chief of the plant Safety First department of the Laurentide Co., Grand'Mere, P. Q., represented that company at the annual congress of the National Safety Council held in Cleveland, Ohio. At the same congress, G. W. Dickson, of the Riordon Pulp & Paper Co., Hawkesbury, read a paper on "How to use Danger Signals in a Paper Mill."

Captain R. L. Graham, who recently returned from overseas, has purchased a mill site in Wiarton. He has a large quantity of standing timber on Great LaCloche Island and also on Manitoulin Island and it is his intention to raft and manufacture it at Wiarton. Operations will commence in the near future but much will depend on the available labor supply.

William Robertson, of Victoria, B. C., who has been in Toronto for several weeks assisting Major James Brechin, B. C. Lumber Commissioner, left recently for the West where he will resume his duties in connection with trade extension work in the Forestry Branch of the Department of Lands. Major Brechin has returned from a trip to the Coast accompanied by his wife and family and has taken up his residence in Toronto. He reports the lumber business in the West as being very active with a strong market and all the mills busy.

Will Build Thousands of Houses

While the Dominion Government passed legislation to assist in meeting the house shortage in Canada, the Ontario Government has been the only Provincial administration that has put the Federal scheme into practical effect, Mr. J. A. Ellis, of the Bureau of Municipal Affairs, Toronto, said recently. With the exception of Alberta and Saskatchewan the other provinces had merely appointed committees for the purposes of investigation. In the case of Saskatchewan and Alberta letters had been received by Mr. Ellis from Edmonton and Regina asking for particulars of what had been done in Ontario.

Mr. Ellis asserted that there would be 1,200 houses, built with Provincial assistance, completed by the end of October, and that they would all be occupied before the end of October. "There is no fear of any of the municipalities having houses on their hands under the Ontario scheme," he said. "Our architects draw the plans and if they do not quite satisfy the prospective tenant or purchaser, any necessary alterations are made. In that way we eliminate any cause for future complaint, and that is perhaps why we have not the slightest trouble obtaining tenants. Next year 4,000 more houses will be built."

Another Advance in Industrial Progress

Owing to the rapid development and extension of the pulp and paper industry in Canada, the Dominion Bridge Co. of Montreal have made arrangements for the establishment of an entire plant which will be devoted to the production of paper making machinery and accessories. The company have already built a number of machines for paper mills, which have been designed by their own en-

Artistic display of doors, columns, newels and stairwork by Batts Limited, of Toronto, at recent Canadian National Exhibition

gineers, and the equipment has met with a most favorable reception. While various lines of pulp and paper-making installations have been manufactured in the Dominion, large machines, such as Fourdriniers for the big newsprint and book paper plants of the Dominion have been built in either the United States or England.

The announcement that these will now be turned out in Montreal is a distinct step in advance in the way of industrial achievement and an augury of the status which the pulp and paper industry is assuming in Canada. It is asserted that the strides in this field during the past two years have been greater than in any other line of activity.

Good Opportunities for Canadian Firms

"Opportunities await the Canadian manufacturers of pulp and paper in the British market, according to A. L. Dawe, Secretary of the Canadian Pulp and Paper Association, Montreal, who has recently returned from a three months' trip to Great Britain.

"I found a large and increasing demand for all classes of Canadian-made paper," stated Mr. Dawe, "Publishers, box-makers and other users of paper products are eager to get their supplies from Canada. They realize that in the past they have relied too much on alien countries, such as the Scandinavian countries and Germany. The opportunities for the Canadian manufacturers in England are just what our producers wish to make them. The business is there waiting for them. The only way to get this trade is to send over expert men and look after it, just as firms here do for the home trade in Canada. If our manufacturers do this, I see no reason why a large and profitable export trade to Great Britain should not be built up."

Timber Exchange Opens in London

The Timber Exchange will shortly be opened in London, Eng., by the Right Honorable Sir Auckland Geddes, M. P., president of the Board of Trade. That the timber trade should have an exchange in the city of London where agents, brokers, importers, merchants and others interested can get together and transact their business has long been felt and recognized. It is announced by the exchange that the formation of such an organization is a definite step in the scheme of national reconstruction, and this is attested by the fact that the president of the Board of Trade will perform the opening ceremony on October 8th. Many leading firms have already joined the exchange and it is prophesied that such a body will be both useful and influential.

Improved Automatic Roller Dryer

An attractive bulletin has been issued by the Coe Mfg. Company, of Painesville, Ohio, which illustrates and describes their automatic progressive roller veneer dryer, which is the result of sixty-seven years' experience. The Coe Mfg. Co. state they are the oldest and largest manufacturers in the world of veneer cutting and drying equipment.

Their automatic progressive roller veneer dryer is an improved apparatus which dries green veneer and thin wood products within a fraction of an hour after being cut ready for the glue-room or crating. Owing to the scientific control of the drying factors the veneer is not only dried flat but uniformly seasoned without internal stresses marking, splitting, checking, case-hardening or other defects.

Just Thirty Years Ago

Interesting items from the files of the October edition of the "Canada Lumberman" away back in 1889

The Georgian Bay Lumber Co. recently filled a contract for square timber for England, consisting of 837,071 feet.

* * *

A timber limit located on the Assiniboine river, near Fort Pelly, was recently sold at auction in Winnipeg. It brought \$3,000.

* * *

It is announced that the Department of Crown Lands at Quebec will hold a large public sale of timber limits some time during the month of December.

* * *

The Thunder Bay River Boom Company has rafted to the various lumber and shingle mills at Alpena, Mich., this season, 1,115,104 logs, which scaled 111,848,640 feet.

* * *

Another large lumber mill may be built on the Fraser River, B. C., next spring. It will be nearly opposite the Ross-McLaren mills and will be as large as any in the province.

* * *

The Brunette Sawmill Company (Ltd.), New Westminster, is cutting 8,000,000 to 10,000,000 feet, in addition to which they are turning out large quantities of shingles, lath and pickets.

* * *

Wages for work in the woods in the Ottawa district are, for scorers, from \$35 to \$37 a month; liners, \$40 to \$42, while a number of hewers have been engaged at \$60. General hands are offered \$20 to \$25.

* * *

The Rathbun Company have recently secured about eighty-five square miles of valuable timber limits on the head waters of the River Trent. The company have also made purchases of large quantities of wood and other material along the extension of the N. T. and Q. railway.

* * *

The Wm. Hamilton Manufacturing Company of Peterboro are busily engaged in turning out orders for mill machinery. They have orders ahead for ten boilers and three engines, with accompanying sawmill machinery.

* * *

The Ottawa lumbermen have undertaken the task of clearing the entrance to the canal of sawdust. In two days 400 feet square by 5 feet deep, or, in other words, 30,000 yards of sawdust were scooped into the main channel.

* * *

Davidson & Hay's new sawmill at Cache Bay has commenced operations. It is beautifully situated on an arm of Lake Nipissing, and is one of the best equipped in Canada, being fitted up with the most approved machinery.

* * *

The Grand Trunk Railway Co. has contracted for 1,000 new cars to facilitate the lumber and grain shipments. It is to be hoped that ere very long the complaints of the lumbermen on the car question will be found no longer necessary.

* * *

Messrs. W. R. Thistle & Co., Pembroke, Ont., in order to wind up their business, are offering for sale their saw milling properties, timber limits, etc. The milling property consists of the Pembroke mill, with lath and shingle mills, boomage and piling grounds.

* * *

Experts in forestry, as a rule, have intimated, if not asserted directly in their discussions, that the supply of choice lumber in the United States is nearer exhaustion than the Canadian stock. This view is broadly controverted by Consul Hotchkiss, of Ottawa, who says that if he were asked whether Canada or the United States would probably be the first to reach the end of supply of marketable commercial woods, he would reply unhesitatingly, that Canada must first face these conditions. Mr. Hotchkiss believes that it is "safe

to say" that the encroachments upon the Canadian pine, in particular, are serious, and that by the process of culling, in order to meet the English demand for clear lumber, the forests of the Dominion have become so reduced that the greater part of the output hereafter will be found available for the markets of the United States only. The English market maintains a peculiar demand for quality and shape, and takes only the product of the choicest trees.

* * *

The lumber export trade during the past season has been very good, especially during the mid-summer months. One of the causes of the heavy shipments during these months was the unusually large demand for square timber, of which a great deal was shipped. The export trade to South America is not a steady business as it varies according to tonnage.

* * *

Messrs. McCuaig & Morehead, of Ottawa, have purchased Mr. E. B. Eddy's limits, with plant, etc., at the head of Lake Temiscamingue, comprising about 135 square miles of territory, situated partly in Ontario and partly in Quebec. They will commence at once the work of taking out square timber. The price paid for the limit is in the neighborhood of \$40,000 cash.

* * *

The Big Mill of the Rathbun Company, Deseronto, recently cut in six days 609,000 pieces of lath, an average of 101,500 pieces a day. The largest cut made in one day was 109,000 pieces. All previous records were broken by cutting 49,000 pieces on a single machine in one day. The largest output in six days last year was 409,000 pieces, being an average of 83,166 pieces.

* * *

A monster raft, consisting of 559,000 feet of timber, owned by Mr. J. G. Grier, of Ottawa, was recently shipped from that city to Kingston, viz. the Rideau canal. The raft was principally composed of hemlock, and will be used in the construction of the dry dock being built at Kingston. The trip occupied five weeks' time, and the raft was the largest that ever went through the canal.

* * *

The rise in the rivers has given a new impetus to lumbering in the Province along the Nashwaak, in New Brunswick, and the logs are getting down in fine style. The Marysville sawmills are again at work and will continue sawing the balance of the season. The demand for lumber is strong with a rising market. The St. John Gazette announces that Mr. Alex. Gibson recently paid \$12 a thousand for 120,000 piled at Pleasant Point. No man in the Province better knows the value of lumber.

* * *

Exports of lumber, deals, etc., from St. John, N.B., during September, show an increase of from \$147,843 to \$250,302, as compared with the corresponding month of 1888. The shipments were: Scantling and boards, 2,715,392 feet; deals, 17,095,717 feet; deal ends, 738,133 feet; birch timber, 610 tons; pine timber, 7,200 tons; palings, 38,285; lath, 8,170,300; piling, 1,637 pieces; shingles, 2,909,576; spruce timber 7,502 feet, and clapboards, 13,425 feet.

* * *

Last year the cut of logs in British Columbia was estimated at 100,000,000. The estimated output for this year is placed at 125,000,000 feet. Along the coast between the Fraser river and Port Neville there are now twenty camps, and two on Howe Sound. The number of men employed in connection with the camps is placed at 600, which with the same loggers scattered along the coast will probably make a total of 700 men who are cutting logs for various lumber companies in that province.

* * *

A leading feature of the Toronto Exhibition was a band sawmill, cutting lumber from oak, ash, hemlock and pine saw logs. By the use of this mill six boards are sawed where five were only got by a circular mill. This mill is very simple, easy to run, while the

power required is fully one-half less than a circular. The lumber is better cut, and in cutting one million feet of lumber 163,000 feet is saved in sawdust alone. The mill was shown by the Waterous Engine Works Co. and is the outcome of many years experience.

* * *

The Dominion Government has refused the petition of Peterborough saw mill owners in regard to throwing sawdust in the Otonabee river. Inspector Gilchrist, of Peterborough, has received fresh instruction from the department of Marine and Fisheries to see that the fines imposed by the magistrates are collected, and also to continue prosecutions as long as the mill owners violate the law. The Government is evidently determined to enforce the law regarding sawdust in streams, so far at least as it refers to the Otonabee river.

* * *

In view of the high prices for square timber at Quebec, last summer there will probably be a large increase in the quantity made the coming winter as compared with last year. It does not follow, however, that the high prices obtained this summer will be maintained next year. An increase of 50 per cent. in the output would necessarily have a great tendency to weaken prices unless there were should be an unusually large demand, and those who base their calculations for next season upon the high figures obtained this year are likely to find out that they have committed a grave mistake. That a large amount of money will be made out of the

winter's cut, when disposed of next year, there is no doubt, providing the market is not glutted. The indications are, judging from the preparations being made, that the winter's cut will be a large one.

* * *

The necessity of devising some means to prevent the accumulation of sawdust and mill refuse in the navigable streams is apparent, as is evidenced by the enormous banks of sawdust which are now obstructing the navigation of the Ottawa river, between Ottawa and Hull. With reference to Mr. Sandford Fleming's report on sawdust in the Ottawa river, an Ottawa despatch says: "It is understood that the statement published as to the river channel being clear does not refer to the soundings from the Chaudiere down to the Rideau locks. With regard to this part of the river, it is learned that by a recent survey and soundings made, by order of the Department of Railways and Canals, at the foot of the locks of Rideau Canal, that the accumulation of sawdust and slabs is very large and increasing daily. There are now only between one and two feet of water in the mid-channel over the surface of the sawdust, where there formerly was from eight feet at the sill to thirty feet in the river channel. Had the river been usually low this fall it would have been impossible for the boats to enter the locks and, consequently, navigation would have been closed. There is a probability of the channel being dredged this fall. A report on the subject has been prepared, and will be submitted to the Government, when it is expected the necessary orders to set about the work forthwith will be given.

Heavy Export Business Will Come in Time Conditions in Old Land Will Readjust Themselves So That Canadian Forest Products Will Get to the Forefront—Survey of the Future

At the gathering of Ontario lumber manufacturers, held in Toronto on September 24th, Mr. A. C. Manbert, Ontario Timber Commissioner, who returned recently, after spending several months in Great Britain, conducting propaganda work in the interest of Ontario forest products and more particularly white pine, touched upon a number of phases and incidents in connection with the overseas situation, to which only brief reference was made in the last issue of the "Canada Lumberman." In his introductory remarks he drew a graphic, present-day picture of the great city of London with its teeming millions, all animated by good nature and buoyant spirits. The whole interest of the people and their activities had been concentrated on the winning of the war and the sense of freedom and relief from artificial control to one of unrestrained action and movement was everywhere noticeable. They seemed to have a good time in "finding themselves," so to speak, after the deprivations through which they had passed during the last four years. Mr. Manbert said that we knew something of the war in Canada, but comparatively little compared to what the Mother Country had experienced in the way of restrictions and restraint. He spoke of the new atmosphere prevailing in the Old Land, and how many problems were viewed, from interesting and hitherto unapproached angles, by reason of altered conditions.

Coming down to the commercial and industrial affairs Mr. Manbert said that in his communications to the lumbermen's committee in the Province and also in his articles that appeared in the press, he had not concerned himself much with statistics under war conditions or pre-war conditions, as, arising out of the changed relations and circumstances, he considered these as possessing little more than historic or sign-post value and not calculated to meet the present situation.

He referred to the warmth of welcome accorded him in all quarters, and added that the average Canadian could scarcely realize how keen the interest was in Canada, which is regarded as the premier colony, and great things were expected from her. It might be that Great Britain and Canada understood each other a little better than any of the other dominions in matters of policy and general attitude and approach. Mr. Manbert said that he had arrived in the Old Country at a time when there was a great feeling of relief at timber control being removed, with all its attendant restraints. When the controller ceased official supervision of the timber, he really continued his perpetual control by buying up large quantities of wood products and the people wondered why the thing was done, whether it was for fear that prices would rise or heavy stocks were required for the housing campaign or if the policy was really the same as before, but operating under another name. A great deal of uncertainty and dissatisfaction had been created in the trade. The timber controller proceeded to dispose of the old stock of pine by allo-

cating it to certain persons who were to see that the stock was not sold above a stipulated price. Spruce from the Baltic regions was also auctioned off and those who were disappointed in not being able to buy at auction, were naturally much aroused and charged the controller with favoritism.

When the government auctioned off the stocks the charge was made that the government was profiteering. The government was evidently feeling its way and did not know how to travel or how its actions would work out. Individual operation is the best method of governing the control of timber and bringing matters back to normal basis. Control had been an impediment in the way of free business. Any remarks that he had to make, Mr. Manbert said, were not delivered in a critical spirit, but simply observations in the nature of things and he was setting forth matters exactly as he found them.

The Baltic Competition is Keen

In regard to the timber situation, Mr. Manbert believed that the timber controller would get over all the pine this year that he had purchased in Canada, but that 100,000 standards of spruce would remain here over winter. Great Britain had used, before the war, about 4,000,000,000 standards of forest products and with the interruptions brought about by the European conflict there had of late been about 50 per cent. of the importations coming from Scandinavia. The Baltic countries competed with the woods from Canada. Their white fir, which was really spruce, and red fir, which was really a pine, were put up in splendid shape, and in a way calculated to meet the exact needs of the English buyer. The white wood was a little softer than our Ontario spruce, but not softer, however, than the Quebec spruce, and the red fir was very much like our own red pine, but carried a little less clear and was sounder knotted. In texture he did not see much difference from our red pine. Mr. Manbert referred to the splendid way in which the Swedish exporters put up their product, all the lumber being stamped and branded while the cutting was even and square. The result was that the Scandinavian product had won an enviable reputation in the Old Country and enjoyed a splendid market by reason of its high standard and careful markings. Taking a long range view it might be admitted that the Scandinavians were perhaps a little better salesmen and catered to the trade in general and to the individual in particular in a manner that suited his whims for the British buyer who was often exacting and, perhaps at times, hypercritical. Of course, Scandinavia did not bestow all these extra attentions without making the purchaser pay for them. The British buyer was apt to think, in a case of Canadian timber, because there was a little wane on the edge or a slight discoloration which in no way impaired its strength or dura-

bility, that the product was not quite as good as that more carefully prepared by the Baltic manufacturers.

It was little things like these which were considered important over in the Old Land and Mr. Manbert thought that more detailed and careful attention might be given to methods of sawing in Canada. Here logs were taken out and brought down in good shape, but were too often butchered in converting them into lumber. Canadian white pine was a preferred wood over in Great Britain and the way we use it in the Dominion would be regarded by the Englishman as a sacrilege. Here the wood is employed in erecting fences, out-buildings, etc., but in the Mother Country it is regarded as being in a class by itself and among the aristocrats in forest products.

Stocks Low and Distribution Slow

On his arrival in the Old Country Mr. Manbert stated that he found general stocks of lumber very low. Ordinary packing boxes were used for making furniture—not the kind that the good housewife covers over with drapery, but regular household articles which were painted. There were only a few thousand feet of Ontario white pine on hand and for everything that dealers had the demand was most urgent.

Touching upon the seriousness of port congestion the speaker said that it was desperate and in London vessels waited as long as two weeks in order to get a berth and even then there were inordinate delays in unloading stocks, owing to the extreme shortage of labor, lack of storage facilities, space accommodation, etc. The same state of affairs prevailed at Bristol, Manchester and other ports. So many handlings of cargoes impeded deliveries and naturally had their effect on the return use of wood. In speaking of the English methods of resawing spruce and pine deals some startling figures were presented, one instance being furnished where it had cost a firm \$25.90 per M. to resaw three inch deals into inch stock, and dress it on four sides. Thirteen to fourteen shillings a day was being paid for common labor, which was not any too efficient and eight hours constituted a day's work. When questioned regarding this heavy outlay of converting deals into the finished product the reply was forthcoming from one operator, the less we do the higher the price of working and the higher the price of working the less we do.

In turned goods, joinery, box shooks, etc., which he had referred to in his reports, Mr. Manbert said there was a great and growing opportunity if Canada was prepared to enter largely in this line, and the interest in our own local market did not make us unmindful of the openings existing over there. "The keen interest and anxiety of every one to talk to me was the basis of a lot of inquiries regarding Canada, and in me getting and giving much general information," continued the speaker, "I endeavored in all my interviews and investigations in connection with propaganda work to make perfectly clear the conditions under which I was sent over by the lumber manufacturers and the province of Ontario. I informed them frankly that I was not there to infringe but to bring back intelligent word to the people here of how we could, as far as possible, meet British requirements in the supply of, and demand for, forest products. The nature of my mission was, I believe, thoroughly understood and appreciated. I sought to impress upon importers and consumers that our timber was different from their home-grown product, and that we had not a sufficient supply to produce it all in eleven inch deals, and that, by insisting in having it that width the available quantity would be greatly reduced, and by shutting out the six, eight and ten inch widths they were penalizing themselves. I found that there was a growing impression in the trade that it was not absolutely necessary to have deals in all the wider widths and informed them that it was advisable in the general scheme of things to take sizes which are provided in other markets for our forest products."

"Some merchants informed me that it was largely a lack of mutual understanding and that the changes brought about by the war and other contributing factors would tend to make them amenable to new conditions. The absence of entire confidence in our manufacturing methods is, I am firmly convinced, due to want of information, and remoteness from the points of supply makes it difficult for the British buyer to give close study to the situation. One man told me that he could use lumber for the making of patterns of greater thickness than he had been doing. Certain routines have been established in the past and the natural and inevitable way has been to travel in that direction. I had many inquiries from all classes of people regarding Canada and the conditions under which we operate here in producing lumber. Many wished to learn how to form closer connections with the industry in the Dominion, how they could get good substantial lines, etc., and it was my business to tell them that I possibly could and give all the information desired."

Work Can Go So Far and No Farther

Mr. Manbert said that it might be asked why he had returned at this particular juncture. Aside from the mark-time period through which the Old Country was passing and that a position had been reached where the recuperative processes in industrial and national life were generally working themselves out to a stable and normal

state of things, there was a limit to which propaganda work could be carried. It must be linked to something concrete to give it life and action, as people after all were most vitally interested in the man who delivered the goods. A propaganda campaign could not of itself endure without something to keep it vitalized and visualized. It must be connected up with a selling programme and tangible results follow. Then interest at home was not as alert in the export situation as some months ago, owing to numerous requisitions for our lumber across the border and by reason of building activity and other local demands.

In closing, Mr. Manbert paid a warm tribute to the efficiency and courtesy of the officials of the Ontario Government office in England and the many kindnesses and assistance he had received from the staff. He thought the people of the banner province of the Dominion should feel proud of the representative which they had in the Agent-General of Ontario, and suggested that larger and more commodious quarters and better equipment—quite apart from the timber business altogether—might well be provided for by the provincial administration.

With respect to future developments in our forests products and how rapidly expansion would ensue in this direction he could not foretell. Owing to the complex industrial and economic situation overseas, with its many currents and cross-currents, any one who would prophesy would be either a mountebank or an idiot. There was bound to be a great demand but just when that would eventuate it was not easy to say. Turning over the page from war conditions to a peace basis was not a simple, easy problem, as many had imagined. It would require time, patience and perseverance, and if results were not as promising and achievements as prompt as had been predicted, it was due, in no small measure, to the fact that our expectations had been too great and our hopes too ardently conceived.

Prince of Wales Visits Sawmill

On the occasion of his recent visit to the Pacific Coast His Royal Highness the Prince of Wales was enthusiastically received. The prince paid a visit to the Hastings saw mill of the British Columbia Mills Timber and Trading Co., Vancouver, and took much interest in the conversion of B. C. giant trees into lumber. The entrances and the mill offices were all draped in bunting and decked with evergreens, while His Royal Highness had the pleasure of entering the mill premises under a beautiful arch of forest greenery, with the words emblazoned above: "Welcome to the Hastings Sawmills. Established 1865."

Shortly before noon the prince arrived, accompanied by members of his staff, and though little notice had been given of the exact time of his arrival a large crowd gathered along Dunlevy Avenue leading from Hastings Street down to the mill. Among other visitors on hand was the Hon. Martin Burrell. The Prince on alighting from his auto was welcomed by Mr. Eric W. Hamber, Mr. Arthur Hendry and Mr. Alex. Hendry, who showed him around the mill.

His Royal Highness was initiated by his guides into the whole process by which a huge and shaggy log is converted into an orderly pile of lumber. In the booming ground of the mill he was shown three logs lying on end varying from 74 to 92 inches in diameter. Then the boom men guided a big stick to the dogged chain of the log slip that dragged it up into the mill. Three huge iron cants worked automatically grasped it with human precision and rolled it into place. At the touch of a lever the carriage on which it rested rolled it into the revolving saws and huge planks were sliced off as one would cut off a piece of cheese.

An instance of the thoughtfulness of the mill officials was shown in the tastefully arranged programmes of the visit, which were distributed as souvenirs among the visitors. In addition to this, as a closing touch, Mr. Hamber presented His Royal Highness with a series of photographs bound in a volume and representing a log in the whole process of its manufacture into lumber. The prince acknowledged the gift gracefully, and then, led by Mr. Hamber, all present united in three cheers and a "tiger," the mill hands joining not less heartily than the rest.

Big Forestry Campaign in Britain

That England, with an area of less than the State of New York, is planning to invest \$17,000,000 in a ten-year campaign to reforest 250,000 acres of land, inspires Dean Hugh P. Baker, of the New York State College of Forestry, at Syracuse, to comment on the need in New York State of particularly noting England's condition and her plans. Great Britain will replace for future commercial use the timber used in France during the war by this expenditure of many millions, while, Dean Baker points out, New York has difficulty even in putting through a plan of co-operation with lumbermen and other private holders for steps toward the growth of timber for the future. He sees in all this a need for a definite forest policy for his state as well as for the nation.

Spruce Mill Plant Busy at Seal Cove

Active Demand for High Class Factory and General Purpose
Spruce of Progressive Organization

One of the most complete and modern sawmills is that erected at Seal Cove, B.C., which is operated by the Prince Rupert Spruce Mills, Limited. This company is aggressive and alert and has a large force of men engaged in the industry. The men behind the enterprise are all practical and thoroughly experienced in lumbering operations. The president of the Prince Rupert Spruce Mills is A. E. Munn, who will be remembered by many old friends in Ontario, particularly in the Georgian Bay district, where he was interested for a number of years in sawmilling and logging. The vice-president is N. S. Loughheed of Abernethy & Loughheed, while the general manager and treasurer is A. A. Ewart of Dempsey-Ewart, Limited, Drury Inlet, B.C.

The mill at Seal Cove was built by J. S. Emerson of Vancouver, under the management of E. F. Duby, now of Portland, Oregon, and the plant was leased to the present company some time ago. In 1918 the mill was operated for six months under a contract for the Imperial Munitions Board for the recovery of aeroplane stock. The present output of the plant is 100,000 ft. per day in rough lumber, and in manufactured lumber about 50,000 ft. The principal product is band sawed Queen Charlotte Sitka spruce, while the company specializes in clear, rough spruce and aeroplane spruce.

The incorporators of the Spruce Mills Company had each carried on logging contracts with the Imperial Munitions Board and their camps at Skidegate Inlet and Cumshewa Inlet in the Queen Charlotte Islands contributed largely to the input of spruce logs for the British government. When the war suddenly terminated there were many million of feet of these logs on hand. The operators are now converting these overplus spruce logs into a product that is meeting with a ready sale in the present active market, much of which is finding favor in the east. The company have supplied a large quantity of lumber for the new dry dock which is under construction in Prince Rupert. Mr. Ewart, the general manager of the mill, has taken up his residence in Prince Rupert. The superintendent of the plant is David Loughheed, and the assistant superintendent, A. H. Gee, and both are well qualified for their respective positions. It is understood that the company have in view plans for extensions in the shape of the erection of a second storage or dry shed of the capacity of the present one—2,500,000 feet—and a finished lumber factory. The material is all on the ground, ready for these additions.

With an unlimited supply of the best kind of virgin spruce near at hand, the ample log storage, the splendid mechanical facilities for manufacturing, handling and shipping direct by rail or water, having the sea in front and the G.P.T. railway in the rear, the Prince Rupert Spruce Mills have entered upon a successful career.

Port Congestions Hold Up English Imports

An interesting report on conditions in the British timber market has been issued by Alfred Dobell & Co., of Liverpool, who state: The arrivals of New Brunswick and Nova Scotia spruce deals were again light, but stocks have increased as deliveries have been delayed by difficulties at the ports of discharge. The demand continues satisfactory. There has been very little change in the position of Douglas fir since our last report. A considerable increase is reported in f.o.b. values. In Scandinavian deals, boards, etc., the arrivals of flooring boards were moderate and insufficient to keep pace with the consumption. Values are very firm. Deals arrived in fair quantities, but port congestion has held up deliveries. In pitch pine forward business has been quiet. C.i.f. quotations remain very firm, and there has been a further advance in f.o.b. values. Several steamers with cargoes, consisting largely of pitch pine, have arrived, but owing to port congestion it will be some time before discharging berths can be allocated, thus holding up deliveries.

The position in American hardwoods has not materially altered since our last report. Consignment parcels are still arriving freely, with the result that stocks are accumulating, and forward business, in view of the unsettled conditions, is difficult to arrange.

New Lumber Company Will Build Mill

Lumber and Pulpwood of British Columbia, Ltd., with a capital stock of \$1,000,000, headquarters in Toronto, has been incorporated to manufacture, buy, sell, import, export and deal in timber, lumber, wood, pulpwood, fibreboard, pulpboard, etc. The organization is also empowered to buy, sell and develop timber limits. It is understood that Ontario capital is largely interested in the new concern which owns 49 square miles of timber limits near Fort George, B. C. It is the intention of the company to develop these limits and erect a sawmill on the property in the near future. The timber consists principally of spruce and the capacity of the contemplated mill will be 100,000 ft. a day.

Davis Rafts of Munition Spruce

The first Davis rafts of cut lumber that entered Vancouver harbor were recently at the government wharf awaiting shipment east. The tugboat Coutli made the long haul from Masset Inlet to Vancouver without incident. There are 2,500,000 feet in the two big rafts, which draw fourteen feet. This lumber was cut at the Masset Timber Company mills at Buckley, on Masset Inlet. It consists entirely of spruce lumber, part of the production of the war-time airplane spruce campaign. The Masset Company bought it from the Imperial Munitions Board.

Present Value of a "Lumber Dollar"

As Compared With Other Building Materials, The Increase in Lumber Has Been Modest

At a most successful gathering of the Northern Lumbermen Salesmanship Congress held in Antigo, Wis., a stirring and timely address on "The Value of a Lumber Dollar" was given by Dr. Wilson Compton, secy.-manager of the National Lumber Manufacturers' Association. The lumber price level may sag sometimes in the future but it is unlikely that it will drop declared Dr. Compton who said:

Roughly speaking the prices of lumber today are twice as high as they were before the war. This means that the purchasing power of each dollar spent for lumber is only half its former purchasing power. There are several reasons for this. Some are relatively permanent and basic; others are superficial and temporary. In looking to the future of the lumber market we should especially give heed to the fundamental conditions. The superficial causes of present prices may quickly vanish.

At the signing of the armistice last November hemlock prices at the mill were 66 per cent. higher than they had been during the twelve months before the outbreak of the war; southern pine prices 85 per cent. higher; Douglas fir 93 per cent; and the average price for all softwoods 75 per cent. Among the hardwoods plain oak was 38 per cent. higher; hard maple 46 per cent; birch 58 per cent; poplar 61 per cent; basswood 69 per cent, and all lumber taken together, both hardwood and softwood, 65 per cent. higher than during the twelve months ended June 30, 1914.

As against the 65 per cent. increase in lumber prices were increases in average prices of other building materials of 94 per cent., including sand and gravel which had increased 91 per cent., lime 95 per cent, cement 73 per cent. common brick 105 per cent., steel 129 per cent. and building tile 108 per cent. During the same period anthracite coal prices had increased 88 per cent., bituminous coal 111 per cent., coke 188 per cent. and fuel oil 92 per cent.

Obviously the increase in lumber prices during this period was modest in comparison with the increases in prices of other commodities with which lumber usually competes.

But let us carry the comparison back over a longer and more representative period. The year immediately prior to the outbreak of the war in 1914 was one of rather unusual depression in the lumber industry and in some other industries also. To use that period therefore as a standard of comparison does not show the whole truth. During that period lumber prices generally were substantially lower than they had been eight years before, namely, in 1906 and 1907.

The year 1906 and the first nine months of 1907 were generally prosperous ones for industry, commerce and agriculture in this country. Let us therefore use the prices of that period as a standard of comparison of lumber prices with the prices of other commodities. Between the first nine months of 1907 and the time of the signing of the armistice in 1918, a span of nearly twelve years, the net increase in average prices of lumber, including all major hardwoods and softwoods, was 56 per cent.

During this period of nearly twelve years prices of hemlock increased 60 per cent., of southern yellow pine 61 per cent., of plain oak 74 per cent., of Douglas fir 41 per cent. as compared with the net average for all lumber, of 56 per cent. During the same period the prices of Portland cement increased 71 per cent., of common brick 98 per cent., of lime 115 per cent., of bituminous coal 119 per cent., of anthracite coal 101 per cent., of coke 123 per cent., of fuel oil 151 per cent.

As compared with the advances in prices of these other building materials and fuels picked at random the 56 per cent. increase in lumber during the 12-year period ending with the signing of the armistice was exceedingly modest. Certain it is that the dollar had at the end of the period a greater relative purchasing power over lumber than it had over any of the other groups of necessities, foods, fuels and other building materials.

France Will Have Many New Forests

Except in the Vosges and the Pyrenees the forests of France were carefully guarded. Each big woodland was named "foret," each little grove was a designated "bois." The State was careful that these fragments of woodland be not destroyed. Humble people gathered firewood from the ground, but the trees were not cut.

It has been held by military experts that the "forests" and "bois" of northern France won the war for democracy. In the final rush of the Germans toward Paris the woodlands were the points of vantage which the defenders most stubbornly held and which the aggressors most diligently sought to capture. It was in the Belleau Woods that American valor first made itself vitally felt as a determining factor in the world war. It was in St. Gobain forest that the Germans made their most determined effort to check the tide of

the allies' advance, and it was in the great forest of the Argonne that the German retreat was most stubbornly contested by the beaten enemy of civilization.

Now many of the forests of northern France are a memory. Where the war swept, the forests vanished. Worse than this, the French willingly sacrificed the far greater forests of the Vosges and the Pyrenees and the great pine groves of the southern coast. Wood was a great necessity for the winning of the war, and France gladly accepted the services of experienced Canadian and American foresters who comprised special forestry regiments, and whose sole duty was to transform French forests into war material. Though these regiments seldom came within range of German bullets, they did an important work.

Now France is confronted with the problem of reforestation. And she is going about the work in the characteristic systematic French manner. When it was a question of a war to be won the French gave their lives and fortunes without question and without repining. Now that the war has been won they are displaying the same spirit in the work of repairing war's ravages. Wherever there was a forest before the war there is to be a new forest. The French may be mercurial and effervescent, but when it comes to a matter of the motherland's welfare there is no more practical people on the surface of the earth.

Mr. Hebard is Appointed Inspector

H. L. Hebard has been appointed inspector for Toronto and district for the National Hardwood Lumber Association, whose headquarters are in Chicago. Mr. Hebard succeeds John J. Miller, who is now identified with the C. G. Anderson Lumber Co. Mr. Hebard has been in the employ of the N. H. L. A. for a number of years, leaving in 1917 to serve the Government during the war and immediately on his discharge he was re-engaged by the Association. He has had experience that will enable him to handle the Toronto district in a satisfactory manner and the officers of the National Hardwood Lumber Association say they consider themselves quite fortunate in being able to secure so competent a man without delay.

B. C. Fir Makes Tallest Flag Pole

British Columbia's gift, the mammoth flag mast, is now in Kew Gardens and is the tallest flag pole in Europe. The huge pole reached England four years ago and its size has delayed its speedy erection, for it was no easy matter to lift a spar of the length of 250 feet. The spar, which replaces the present flag staff at Kew Gardens, London, which was also from British Columbia, is the finest sample of Douglas fir that the B. C. Forestry department could find. Their best men roamed the forest slopes of the Pacific for a long time, and twelve giants were felled to find this particular spar. Some of the twelve were fully 250 feet high, but a slight warp or defect condemned all except this one, which is a perfect spar 220 feet high.

Mr. Meyer Organizes New Company

The many friends of Montague L. Meyer, British timber purchaser, who visited Canada some months ago in company with Sir James Ball, British Timber Controller, will be interested in learning that he has formed a new company in London, Eng. Montague L. Meyer, Limited, has been registered as a private company, with a capital stock of £100,000, to take over the business of timber merchants, carried on formerly under the style of Montague L. Meyer. The offices of the company are at Pelmerston House, London, E. C.

Find Shortage of Help in North

Austin & Nicholson, of Chapleau, stated that they are operating approximately the same number of camps this year as last. Up to the present men have been more plentiful, although during the last month there was a definite shortage of labor, which the firm believe will improve when the saw-mills close down. Camp supplies are on the average about 10 per cent. to 15 per cent. more costly than last year. Austin & Nicholson are not taking out any pulpwood at all this season.

Wall Board Men Take Pulp Plant

The Niagara Wall Board Co., Inc., Buffalo, N.Y., have acquired the pulp mill of the Moore Paper Co. at Penn Yan, N.Y. By acquiring this mill the Niagara Company, which was recently organized by Buffalo men who have grown up with the wallboard industry, control their own supply of semi-manufactured fibre used in the production of wall board. In addition to the pulp plant a factory building has been acquired a short distance from the mill for a finishing plant. By locating both plants in the same city a practical arrangement has been effected. The president of the company is J. B. O'Brien, and C. C. Hullinger is secretary-treasurer.

MORE LUMBERMEN CANDIDATES IN THE ONTARIO CONTEST

R. E. Butler, Woodstock, Ont.,
who is Conservative Standard Bearer in
North Oxford

Zotique Mageau, Sturgeon Falls,
Late Representative, who is again running in
Liberal interests

James G. Cane, Toronto,
Liberal Standard Bearer, who is contestant
in Northwest Toronto

Good Luck to the "Boys of the Bush"

James G. Cane, of Jas. G. Cane and Co., wholesale lumber merchants, Toronto, has been nominated by the Liberals of Northwest Toronto, as their candidate for seat "B" in the Ontario provincial elections. His running mate is Lieut.-Col. H. S. Cooper, M.C. Mr. Cane is putting up a vigorous campaign.

Zotique Mageau, who has represented the riding of Sturgeon Falls in the Ontario Legislature in the Liberal interests since 1911, has again been nominated as the standard bearer of the party in the forthcoming provincial elections. Mr. Mageau is a well known lumberman.

R. E. Butler, head of the R. E. Butler Lumber Co., Woodstock, Ont., has been unanimously nominated by the Conservatives of North Oxford as their standard-bearer in the coming provincial elections. In accepting, he stated that as he contested the riding on four different occasions, he had about decided to make way for someone else. He had, however, been approached by so many electors from different parts that he had consented to allow his name to go before the convention.

Senators Visit Mills and Nurseries

At the invitation of Senator Smeaton White, of Montreal, several members of the Senate have visited Shawinigan and Grand'Mere, P. Q., for the purpose of inspecting the industries of those places. The party was met on their arrival at Shawinigan Falls from Ottawa by Mr. H. Biermans, general manager of the Belgo Canadian Pulp & Paper Co., Ltd., and afterwards visited the mills of that company, in addition to inspecting the plants of the Shawinigan Water & Power Co. and allied concerns. At a luncheon Mr. Biermans took occasion to refer to the action of the Government in fixing the price of paper, which he considered was detrimental to business interests.

Dinner at the Laurentide Inn, Grand'Mere, with Mr. George Chahoon, jr., president, provided an opportunity for many of the senators in short speeches to express to him their appreciation of the national work he and his company were performing in welding into one harmonious whole a community of working people free from labor troubles. In this fact alone it provided an object lesson for the rest of the Dominion. The company's policy of re-afforestation was also highly commended, and the support of the visiting senators pledged to such a work.

In reply Mr. Chahoon briefly sketched the history of his company, for the last seventeen years, and modestly disclaimed any credit for the position the company now occupied in the manufacturing world or for the model living conditions of the town of Grand'Mere. He admitted, however, that the ideal relations existing between its employees were in a great measure responsible for the prosperity of the company. He dwelt at considerable length upon the necessity of a reafforestation policy for the whole Dominion, pointing out the grave position that the United States now finds itself in, owing to the depletion of its forests. His own company had entered into an extensive scheme of reafforestation, and would plant 2,000,000 trees

next year, but he felt that the Government should compel timber operators to plant one tree for every one cut down, and the Provincial Government should at the same time co-operate in the way of exemption of taxation for such lands as were being replanted.

Mr. Guy Tombs, traffic manager of the Canadian Export Paper Co.; Mr. L. Armstrong, secretary-treasurer of the Laurentide Co., and Mr. F. A. Sabbaton also made short speeches.

Activity in Lumbering is General

Reviewing general conditions in the lumber arena the Labor Gazette, of Ottawa, in its last issue, says: Westville reported that lumbering operations showed a further slight decline. Charlottetown reported quietness. The saw and shingle mills at St. John were operating steadily. Fredericton reported that the lumber mills and booms were very busy and that preparations were being made for the season's operations in the woods. Quebec reported the sawmills of the district still working at full capacity except in a few cases where the last season's cut was limited through failure to obtain men and through the epidemic. The saw and shingle mills at Sherbrooks were well employed. The sawmills at Ottawa and Hull were rather busy. Peterborough reported quietness. Owen Sound reported that the sawmills continued to be active. Sault Ste. Marie reported that the lumber yards were very active and that lumbermen were experiencing difficulty in securing the right class of men for their operations. Calgary reported that men were being sought for the lumber camps and sawmills. Following the severe bush fires in July, Fernie reported further fires in August which resulted in a serious curtailment in the amount of logs taken out, so that in some instances mills were forced to close down, while others operated only at limited capacity. Despite this, however, lumbermen in nearly all cases were actively engaged in making preparations for logging operations on a very large scale. Vancouver reported the saw and shingle mills busy. Victoria reported the lumber trade very active on foreign shipments.

Death of Public Spirited Lumberman

In speaking of the death of Daniel E. Richards, which was referred to in the last issue of the "Canada Lumberman," the press of his native town, Campbellton, N.B., pays the departed lumberman and captain of industry a well merited tribute. "The Graphic" says:

Deceased, who was 52 years of age, was the eldest son of the late Mr. and Mrs. David Richards, and was born here. Early in his life he went into the lumber business with his father, and to his careful study of that business is no doubt due the great success of the various enterprises with which he was connected. He was president of the following companies: Richards Manufacturing Co. Ltd., Continental Lumber Co., Restigouche Lumber Co., Restigouche Log Driving & Boom Co., Tobique Lumber Co.

He always took a deep interest in the welfare of Campbellton, and for a number of years represented Ward 1 on the council board. The various enterprises with which he was connected contributed much to the prosperity of Campbellton.

Logging Operations and Legal Decision

The Quebec Compensation law applies to lumbering in connection with a mill. An interesting legal decision was rendered recently in Quebec in the case of Perron vs. Veillette, and judgment was given in favor of the plaintiff for \$370. The particulars of the suit are as follows:

An axeman employed at a lumber shanty was severely hurt by a fellow workman through being struck on the foot by his axe. He brought action against his employer under the Workmen's Compensation Act of Quebec, claiming \$162.50 for temporary incapacity, estimated at 10 per cent. The defendant, who was under contract as a jobber to cut wood for the Belgo-Canadian Pulp and Paper Company from its own timber limits, claimed that the nature of this work was agricultural, not industrial, and, consequently, the law did not apply. The defendant proved that he was a farmer and that, like all the farmers in that neighborhood, he cultivated his own land in the summer and in the winter took small contracts for cutting wood. The law of France, upon which the Quebec law was based, and which declares that forestry operations are agricultural, was also quoted in support of his contention.

It was held by the Court, in accordance with a recent judgment of the Court of Appeal, that lumbering operations carried on in connection with a particular mill cannot be separated from the actual work of the mill and are therefore industrial. It was further held that it made no difference whether the lumbering was carried on directly by the industrial company operating with the company. Neither did the fact that the defendant was a farmer make all the work performed by him agricultural. The Court, therefore, ruled that the law of industrial accidents applied to this case and judgment was given in favor of the plaintiff for \$370.

Finds Big Improvement in Camps

Rev. Thomas M. Joplin, field secretary of the Shantymen's Christian Association, is in Montreal on his annual visit. He represents an association that works in the lumber camps of Canada from the Atlantic to the Pacific. Its eleven missionaries visited some two hundred and seventy camps in the year that ended March 31 last, and addressed over 13,000 men. Dog trains and sledges were requisitioned to carry the missionaries to some of the remote spots where the camps were situated. In the past year the Shantymen's Christian Association has extended its activities to British Columbia.

Mr. Joplin reports that conditions in the shanties in British Columbia are by no means as crude as they were ten years ago. Bunk houses are well lighted and heated and fitted with iron beds. Running water and shower baths are provided and a large reading room is included in the camp. Excellent food is provided. The men work eight hours a day for \$90 a month and up, and the work is far less difficult than it formerly was, all the heavy lifting being done by donkey engines.

According to Mr. Joplin there is a Bolshevik element among the foreign-born lumbermen, which the missionaries have been able to fight successfully. "In the present condition of unrest one good missionary makes more for the safety of the country than a regiment of soldiers," is a statement of William Henderson, of Toronto, superintendent of the Shantymen's Christian Association.

Mr. Joplin is spending a month in Montreal and will endeavor to raise the sum of \$5,000, which the executive of the Association has decided is Montreal's share towards the work. Mr. Joplin hopes to obtain French-speaking workers in Montreal in the interest of the work which is undenominational in character.

Preventing Track Creeping on Grades

On the logging railroads of the Smith-Powers Logging Co. we have in the past tried various methods for preventing rails from running or "creeping." We have tried tying them down with cable, putting in switch points and letting the rail run, and various other schemes.

The best results we have obtained have been by placing a heavy piece of timber under the rails as a "dead man," preferably a tim-

ber 8 x 16 inches, and 10 to 16 feet long, which offers a 16-inch bearing surface for the rail. This timber is firmly embedded and tamped tightly to the rail with proper grade and is secured by bracing it from the banks, or anchoring it in rock or concrete bed.

If it is on a bridge we bolt the "dead man" through the stringers with machine bolts. We then slot each rail three times on each side with slots large enough to fit a track spike. These slots are cut about three inches apart and the spikes driven into them just as into an ordinary tie.

The number of "dead men" necessary, we find, varies according to the grade, amount of traffic, weight of steel and condition of the road bed. On some of our 6 per cent. grades we place these timbers every few hundred feet and we have found them quite successful in holding our tracks in place.

It has been suggested that I say something about our method of shooting the tops off high lead trees. We shoot them at a height where the diameter of the tree is from 20 to 24 inches, providing the tree is sound and reasonably straight. The most successful way in which we have been doing this is to cut in a square notch, on the leaning side of the tree, to a depth of six to 10 inches. The height of the notch will average about the same. We use on an average 22 stocks of 20 per cent. stumping powder and tamp it in with about two gallons of wet clay. We take the powder out of the sticks so as to make a paste of it, put the cap in the middle of the charge and use about 12 feet of fuse.

We hang a strap and climber's block two feet below the notch in which the powder is placed. Sometimes we attach a light rope or a piece of whistle wire to the lower end of the fuse, running from there to the ground. This is an extra safety precaution so that in case the climber has trouble in getting down the tree the cap can be pulled out of the charge from the ground.

We use a single three-quarter-inch manila rope, or a 3/8-6/19 steel cable, which is preferable for hoisting rigging to the top of the tree. We leave this line in the tree so as to use it for raising the men to oil the block after the tree is rigged. When there is a wind blowing, or when a tree top has considerable lean to it, our climbers invariably prefer to shoot the tops rather than to cut them off. On calm days and with straight standing trees the usual way is to chop off the tops with an axe.

Another thing we are doing is using large clevises on the end of the main line for the high lead yarders. The advantage over the old style rigging plate is that two tag lines can be hung to it and several smaller clevises dispensed with. This has a particular advantage in small logs, enabling a yarder to handle several of them rather than one, as is only possible with the single tag line method.

We have a hole punched in the side of this clevis and a light link and a swivel put in for the trip line. This clevis is never used for ground haul, or in pulling through a tommy, as it is too cumbersome. It is only adaptable to the high lead.—By Fred W. Powers, superintendent of Smith-Powers Logging Co., of Powers, Ore., delivered at the tenth session of the Pacific Logging Congress at Portland, Ore., Oct. 8 to 11.

Missing Bushmen Returned Safely

The three bushmen reported lost for the past ten days in the Stockpool district reported at Biscotasing safe and sound. They were out for ten days without shelter of any kind, and subsisted on berries and boughs. Their only regret is that the fourteen men who have been searching so industriously for them since their disappearance had to suffer the hardships of a hard and fruitless hunt.

Archambault, an experienced bushman, found that his party had travelled farther than expected the first day out, and as they were in virgin bush he lost his bearings. He landed at Biscotasing Lake the following day, and by following the chain of lakes came out on the C. P. R. Instead of attempting to retrace his steps, he came through the bush to the lumber office at Stockpool.

They travelled more than seventy miles, and incidentally cruised a large timber area.

The Why? of Another Victory Loan

WHEN, on the morning of November 11th, 1918, the guns were hushed and glad tidings flashed across the world, there followed with the Nation's Prayer of Thanksgiving, one yearning query, which found echo in the faster beating hearts of wives, mothers, fathers, brothers, sisters and sweethearts. That query was "How soon will our boys be home?" And from France and Flanders, from Italy and Egypt, from Palestine and from far-off Siberia, there came an answering echo, "How soon, how soon, may we go home?"

CANADA caught the spirit of these longings, and at once resolved to satisfy them. It was an appalling task. Shipping was tragically scarce. The composition of the Army of Occupation had not then been settled. And other parts of the Empire as well as Canada were looking for the speedy return of their men.

THE problem was this. The half-million men that Canada had overseas had taken more than four years to transport to the field of battle. To bring them home in a few months was a gigantic undertaking—one to tax all Canada's ingenuity and resources. Canada solved the problem, but it meant crowding into a few short months, an expense for demobilization which it was impossible to foresee.

THEN, too, besides the sentimental aspect of the necessity for bringing the men home quickly the economic side could not be overlooked. That was, to transform efficiently and speedily the nation's army of fighters into a national army of workers.

* * *

Need Divides Itself in Two Parts

The answer to the question "Why does Canada need another Victory Loan?" divides itself into two parts. (a) To finish paying the expenses of demobilization, and the obligations we still owe to our soldiers. (b) To provide national working capital.

Obligations to Soldiers

The obligations to soldiers include: That already incurred cost of bringing home troops from overseas.

The payment of all soldiers still undemobilized. This includes more than 20,000 sick and wounded who are still in hospital, and who of course remain on the Army payroll till discharged.

The upkeep of hospitals, and their medical and nursing staffs, until the need for them is ended.

These three items alone will use up at least \$200,000,000 of the Victory Loan 1919.

Gratuities

There is also the gratuity which has been authorized, and has been and is being paid to assist soldiers to tide over the period between discharge and their re-adjustment to civil life.

For this purpose alone, \$61,000,000 must be provided out of the Victory Loan 1919, in addition to the \$59,000,000 already paid out of the proceeds of the Victory Loan 1918.

Land Settlement

Furthermore, soldiers who desire to become farmers may, under the Soldiers' Land Settlement Act, be loaned money by Canada with which to purchase land, stock and implements.

The money so advanced will be paid back; meantime each loan is secured by a first mortgage. Up to August 15th, 29,495 soldiers had applied for land under the terms of this Act; and 22,281 applications had been investigated, and the qualifications of the applicant approved. For this purpose Canada this year requires \$24,000,000.

Vocational Training

For this work which, with the Vocational Training and Soldiers' Service Departments, embraces the major activities of the Department of Soldiers' Civil Re-establishment, an appropriation of \$57,000,000 is necessary.

These national expenditures are war expenses. They will be accepted readily by every citizen who gives thought to the task which Canada faced following the Armistice, and to the success with which she has met it.

National Working Capital

Canada needs national working capital, so that she may be able to sell on credit to Great Britain and our Allies the products of our farms, forests, fisheries, mines and factories.

You may ask "Why sell to them if they can't pay cash?" The answer is, "Their orders are absolutely essential to the continuance of our agricultural and industrial prosperity."

The magnitude of these orders and the amount of employment thus created, will depend upon the success of the Victory Loan 1919.

The "Why" of Credit Loans

Farmers and manufacturers (and that includes the workers on these orders) must be paid cash for their products. Therefore, Canada must borrow money from her citizens to give credit, temporarily, to Great Britain and our Allies. Actually, no money

will pass out of Canada. If Canada does not give credit, other countries will; and they will get the trade, and have the employment that should be ours, to distribute amongst their workers. And remember, we absolutely need these orders to maintain employment. If we don't finance them business will feel the depression, employment will not be as plentiful, and conditions everywhere will be adversely affected.

For Transportation

Money must also be available to carry on the nation's shipbuilding programme, and other transportation development work.

For loans to Provincial Housing Commissions who are building moderate priced houses.

These, then, are some of the things for which Canada needs national working capital. She is in the position of a great trading company, and her citizens who buy Victory Bonds are the shareholders.

Those who give thought to our outstanding obligations to soldiers, and to our need for national working capital, cannot fail to be impressed with the absolute necessity for the

Victory Loan 1919

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 20 cents per agate line (14 agate lines make one inch). \$2.80 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 20th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Wanted Lumber

Hardwood Lumber wanted. Birch, Maple, Basswood and other Hardwoods. Dry or sawn to order. We send inspector. Box 14, Canada Lumberman, Toronto. 17-20

Wanted for Cuban Trade White Pine

Send lists and prices at once to
E. ANTONIO VAZQUEZ,
44 Whitehall Street,
New York City.
19-22

Wanted To Buy LATH

We are in the market for large quantities of Lath; all grades, including No. 3 and 32". Paying good prices and cash on receipt of B.L.

What have you to offer? Send good description, lowest price F.O.B. Chicago, stating quantity offered.

COVEY DURHAM COMPANY,
431 S. Dearborn St.,
Chicago, Ill., U.S.A.
20-21

For Sale-Lumber

FOR SALE

50,000 feet 1" round edge Poplar.
25,000 feet 2" round edge Poplar.
Good widths and lengths. This stock is well dried out and ready for immediate shipment. J. B. Brand, Bank of British North America Bldg., St. John, N.B. 19-20

FOR SALE

Hickory Specials

100 M pcs. 3/4" Dowels, 48" long.
20 M pcs. 1" Squares, 48" long.
Also some shorter stock. All high grade, second growth Hickory. Can ship immediately. Will sell cheap. Address Box 31, Canada Lumberman, Toronto. 19-20

For Sale-Machinery

For Sale

Portable mill of 40 h.p. edger, trimmers, butting saw and all machinery necessary for 12 M. feet daily, first class condition. Splendid site if wanted. Box 34, Canada Lumberman, Toronto. 19-20

For Sale

- 1—17 x 24 Atlas Engine, with 36 in. x 10 ft. flywheel.
- 3—No. 94 Berlin Matchers, 15 in., fitted with hard steel knives on top and bottom cylinders—one pair shiplap, jointer and flooring heads with bits for each machine.
- 1—No. 182 Berlin Double Surfer, 30 in. x 6 in.
- 1—No. 199 Berlin Buzz Planer.
- 1—No. 290 Berlin Picket Header.

The Otis Staples Lumber Company, Ltd.,
19-t.f. Wycliffe, B.C.

FOR SALE

- 1 Steam Feed Carriage with Steam Set Works, "Waterous Model."
- 1 Nigger, complete, "Waterous Model."
- 1 Wicks Gang Saw, complete with saws and steam engine, "Midland," 60 H.P.
- 2 Shingle Machines, complete with saws.
- 11 Pulpwood Barkers.

For particulars apply to
CHICOUTIMI PULP CO.,
17-20 Chandler, Que.

Band Saw Mill Complete

Waterous 9 ft. Band Mill, Gunshot Feed Carriage, with extra Saws complete.

Filing Equipment

Three Saw Edger, lot of live rolls, Engine, Shafting, Hangers, Pulleys, etc.

All of the above is Waterous equipment in good condition at a bargain.

The Geo. F. Foss Machinery & Supply Co.,
Limited,
305 St. James Street,
17-t.f. Montreal, Que.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

LUMBERMAN, 30 years of age, having sold lumber throughout New York and New England States, wishes to represent a Canadian firm in the same territory, excellent recommendations. Box 30, Canada Lumberman, Toronto. 19-20

OFFICE POSITION WANTED in lumber company. Five years' practical experience. Pay Rolls, Specifications, Bookkeeping, etc., etc. Quebec province preferred. No objection to northern location. Box 39, "Canada Lumberman," Toronto. 20

WANTED POSITION by representative and superintendent, still employed with large wholesale firm, with twenty-five years' experience in the lumber business. Can give reference as to capabilities and take charge on a month's notice. Box 991, Canada Lumberman, Toronto. 19-20

WANTED OFFICE POSITION by Clerk with good experience in lumber office work. Bookkeeping, etc., general assistant to manager; or charge of small office. Preferably North Shore, or Gaspe coast in Quebec province. References from former employers. H., Box 41, Canada Lumberman, Toronto. 20

Wanted-Employees

YARD MAN WANTED for inspecting and looking after yard of hardwood lumber.

MERRITT & COMPANY,
19 Chatham, Ont.

POSITION OPEN for a high-class man capable of organizing and assuming full management of all lumbering operations of a 500 mile timber limit for a Company operating a Saw-mill and a Pulp-mill. All replies will be treated confidentially. A permanent position with a good salary open for the right man. Box 993, Canada Lumberman, Toronto. 19-21

WANTED—A number of experienced Hardwood Sawmill Operators to contract to take out large quantities of Hardwood during the coming winter. Stumpage can be furnished if necessary, and the necessary cash advances to assist responsible operators. Address Box 19, Canada Lumberman, Toronto. 17-20

YOUNG MAN, experienced bookkeeper and stenographer, wanted, that will invest some money in limited company. Experienced in sash and door factory, planing mill and lumber business. Must be capable of taking full charge of office, and keeping all office work up to date. Opening on board of directors and secretary-treasurer for man with right qualifications. Apply to Box 25, Canada Lumberman, Toronto. 18-tf

Business Chances

1,280 ACRES OF TIMBER, estimated to cut 25,000 ft. per acre, \$9,500. Box 654, Nelson, B.C. 19-22

For Sale

Building and machinery of good Double Cut Band Sawmill, well equipped with steam feed, canter, loaders, etc.
Also two storey Brick Factory on large lot convenient to two railways; splendid location. Address Box 949, Owen Sound, Ont. 12-t.f.

FOR SALE

On reasonable terms, a well established retail lumber business in a live and growing city, will be sold as a going concern, including central site, convenient to railway facilities. Apply Box 986, Sault Ste. Marie, Ont. 17-20

For Sale

One Detroit Hot Blast, Dry Kiln System, complete with Fan and Engine, also 35 feet of 9" double leather belt, used two weeks.
Port Hope Veneer & Lumber Co.,
13-t.f. Port Hope, Ont.

FOR SALE

1,000 acres standing hardwood timber, 8 miles from railroad. Good portable mill proposition (Deeded Land), \$5.00 per 1,000 ft. For particulars write Box 214, Thessalon, Ont. 17-20

Timber Lands For Sale

in the Province of Quebec, on the South Shore of the St. Lawrence, on tide water. Freehold lands 35,000 acres, Crown lands 60,000 acres.

An up-to-date sawmill is built, having a capacity of 40,000 to 50,000 feet of sawn lumber and 100,000 to 125,000 shingles.

For further information apply to the River Ouelle Pulp & Lumber Company, St. Pacome, Que. 17-20

TIMBER LIMITS

I have a number of good Timber Limits for sale. Particulars, Wm. Cooke, Starr Building, Toronto. 20-t.f.

Saw Mill Plant For Sale

Practically new and modern Saw Mill Plant, capacity about 30 Million feet per annum, located in the Interior of British Columbia on a beautiful inland lake and on the main line of the Grand Trunk Pacific Railway. About 500 Million feet of timber on and adjacent to Lake (about 90% Spruce) and another Billion feet available at reasonable prices. Natural conditions ideal for economical logging, manufacturing, piling and shipping. An advantage of about \$4 per thousand feet in freight rates to the Prairie Provinces over Coast shipments.

This property offers unlimited possibilities as a lumber, pulp and paper property. Would consider selling a half interest. Terms reasonable.

A. C. FROST COMPANY,
134 South LaSalle Street,
5-t.f. Chicago, Ill.

35	1 Cameron Feed Water Suction Pump.	
36	1-3" Globe Valve.	
37	1-6" Gate Valve (part of engine).	
38	8 Pulp Grinders.	

FURTHER PARTICULARS ON REQUEST

Brown Company, Portland, Maine

Perpetuating Supply of Pulpwood

Canada produces annually about \$100,000,000 worth of pulp and paper products. During the past ten years, especially, the industry has made rapid progress, until it is now one of the most important in the country. The three outstanding requisites for the maintenance of the industry are large accessible forest areas, particularly of spruce and balsam, adequate cheap power, preferably water-power, and a plentiful supply of labor. As to the two former, nature has been prodigal in her gifts to Canada. Water-power is not only abundant but is widely distributed. The virgin coniferous forests of Eastern Canada were of vast extent, and it is perhaps not entirely surprising that the early settlers and explorers considered them to be all but illimitable.

But, for at least thirty years, keen observers have foreseen the possibility and, indeed, the probability, of exhausting the natural supply of pulpwood. The rapid growth of the paper industry has brought the time within measurable distance. The larger producers of paper, particularly in

Quebec and Northern Ontario, where the industry is mainly centred, have scented the danger and have taken initial steps to put the pulpwood forests on a permanent basis. It goes without saying that it is a great advantage to have an adequate supply of pulpwood forests at the "back door" of the mills. Consequently, extensive planting of cut-over lands has already been undertaken.

Not Sowing Seeds of Business

Are you sowing seeds of business? Or do you depend on a "volunteer" crop?

What would you think of a farmer who, after harvesting a crop left the ground untilled on the theory that without any effort on his part he would get a good volunteer crop the following year? asks the "Retail Lumberman."

You'd decide that he was a pretty shiftless fellow, wouldn't you?

All right, then, how about your fields; the territory upon which you depend for your crop of orders? Are you tilling them, cultivating them, harvesting them continually, persistently, properly and profitably?

In this connection we want to

tell our readers about a little news item that appeared in one of the local papers published in a certain Western town. The item said: "Lumber prices continue to climb, according to contractors, who say there is no telling where the prices will stop. Ordinary dimension lumber is retailing from \$55 to \$60 per thousand feet. Shingles too, have taken a big jump."

We haven't investigated yet, but we'll bet a new fall hat against your laundry bill that the dealers in that town are NOT advertising in their local papers. We'll also bet that they have neglected to establish the proper personal relations with the publishers of those papers. Also, they have failed to tell their publishers just what is happening in all the lumber producing sections to cause lumber prices to advance, and it is very evident that they have not informed those papers as to the comparative advances in prices of other commodities which would, of course, show that the advances in lumber are still short of reaching the same percentage as in the case of other staples.

Those dealers have NOT sown the seeds of business diligently.

Trees as Every Day Environment

Trees not less than architecture determine the beauty of the city. Trees proved certain factors in the life of cities which, from the sanitary standpoint, are invaluable. For example, the Commissioner of Health of the City of New York some years ago investigated the cause of the high death rate in that city and found that the extreme heat was one of the main causes. It was, therefore, resolved that "one of the most effective means for mitigating the intense heat of the summer months and diminishing the death rate amongst children is the cultivation of an adequate number of trees in the streets." The 81,000 trees in the City of Paris are an example of what can be done when tree planting is undertaken by the city as a businesslike proposition.

The economic value of shade trees, both to the city and to the individual home, is also inestimable. A certain farm in Ontario possessed a fine avenue of pine trees leading to the house. For some reason these trees were cut down and it is vouched by firsthand authority that when the farm was sold a few years later its value had depreciated \$5,000 owing to this one factor.

Trees, as one of Nature's finest products, which constitute an environment to our everyday life, are not appreciated as they should be. Remove the trees and place humanity under desert conditions and its life would be lowered in morale. It is reasonable to expect, therefore, that one of the

ways many individuals will wish to commemorate the great war will be by planting trees. Fortunately the choice of suitable trees is large, but, owing to that very fact, sometimes trees of an unsuitable type are planted through ignorance.

Review of Current Trade Conditions

Ontario and the East

Generally speaking, business continues brisk and the whole outlook is favorable. Nearly every wholesale firm reports that buying has been proceeding freely on the part of the retail yardmen and there is a decided scarcity of stock in some lines, particularly in hemlock, which has been in most active requisition. Preparations are going on on the part of most of the larger firms to greatly increase their cut in the woods during the coming winter and the extent of operations will be determined by the amount of help available. Different reports come from various centres and it is interesting to note that, while men are plentiful in certain sections, there is a decided shortage in others. It is felt, however, that when the saw-mills close down a certain percentage of labor will be released for woods operation. A number of mills have finished their cut for this year and are looking forward to increased production during 1920. Other plants will be busy up till the end of the present month or until streams freeze up. The reports, that have been circulated in some newspapers to the effect that, owing to the high cost of production, the log cut this season would be smaller than usual, is misleading, as not a few concerns are doubling the number of their camps while others are materially increasing them. Building continues quite active in the various cities, but prices have again taken a jump which has caused a slight setback in certain quarters.

During the past month white pine doors have advanced 50c each and chestnut doors \$1.00 each, while oak doors have ascended 20 per cent. It is the same with all other building materials, and flooring is "out of sight," as one salesman expresses it. The prevailing quotation on clear, quartered, 3/8 oak is now \$225 per M, whereas not so long ago it was selling at \$150 per M. Select No. 1 3/8 is now \$165 and only a few weeks ago was \$125. Clear plain red and white oak flooring is now \$150 while selects bring \$125. Birch, selected red, has jumped from \$120 per M. and clears to \$95. The only item of flooring in which no aviation has taken place is maple, which is not in as active demand as other lines of hardwoods. Recently white pine sash and window frames have gone up from 15 to 20 per cent., while there are similar advances in many other items. Hemlock is now selling at \$52 per M. for plank, sized, and boards, dressed, 1 x 4 to 1 x 12, are up to \$55. Spruce flooring, 1 x 4, strips, is quoted at \$58, which is an advance of \$4, and pine flooring, 1 x 4, is \$68. Every other line shows a raise from \$2 to \$4 and in some instances more.

It would appear that the large builders defer action, the more their structural undertakings are going to cost. As to when the present ascending values will cease, this is largely a matter of conjecture and will be determined by the cut in the woods this winter, the relative cost of living, wages, export demand, etc.

Hardwoods of all kinds are in active demand, particularly birch and elm. Furniture factories, automobile concerns, gramophone plants and others are all doing a rushing business and increasing costs seem in no way to deter the number of inquiries coming to hand from every quarter. The people have money and are evidently determined to buy a good article in either the furniture or the musical instrument line. Quality is the watchword in most of the purchases.

In regard to British Columbia stocks, there is a fair demand at the present juncture, but some complaints are made regarding delayed shipments and car shortage. There has been some drop in shingles, as is usual at this period of the year when the "peak of the load," so to speak, is over. Some predict that prices will fall considerably, while others expect a reduction of only 50 or 75 cents. Lath of all kinds are still very scarce and high in price.

It may be added that B. C. timber prices are somewhat firmer and there is a fair call for the goods. Flat grain flooring from the Coast is difficult to get in straight car load lots and there is a lively call for the same.

Summing up the whole situation, a leading wholesaler declared that business was never better, but stocks are getting lower all the while, and there is no evidence of prices showing any tendency to recede. Collections are satisfactory and shipments for the most part are good, although some firms report difficulties owing to Canadian roads refusing to allow their cars any longer to go across the border with lumber consignments as many thousands of Canadian cars not being returned promptly.

It is interesting to note that at a large gathering of retail dealers

recently held in Detroit one of the best authorities of the trade, who has carefully canvassed the situation, advised his hearers to buy lumber steadily for the next seven months as, in his opinion, there was no possibility of any reduction in values before that period. Except in Montreal, where a strike of the building trades has held up many contracts, the number of building permits in all the larger centres of population continue to show a gratifying gain. There is still an abnormal demand for houses in most eastern cities and towns, and rents are continually advancing, while prices for all sorts of dwellings have gone up amazingly, and were never as high as at present.

One item of interest to the Canadian lumber trade in general is that the railroad administration in the U. S. will make no increase in freight rates before the return of the roads to private operation, in January next. Canadian carriage charges have ascended in every instance, and recently they have been augmented on the other side of the line, and it was freely predicted that another advance would be put into effect this fall, but the latest intelligence that tariffs will remain as they are for some months, is most welcome.

Several consumers and others are complaining of the delay in getting worked lumber from the mills in Northern Ontario. This is due to the fact that planing mills are so busy that it is impossible to secure car loads dressed in transit, with any degree of expedition. Every dressing plant is pushed to capacity.

Great Britain

Trade in general is slowing improving but there are so many disturbing factors and cross currents that no one can gauge the general situation. In the meantime, the present chaotic state of affairs is accepted with equanimity and there is a quiet confidence that all will come out right in the end. The excrescences are largely on the surface and it is believed that the heart of the nation is sound and true. English trade papers are not disposed to be pessimistic over the situation, and, while admitting that business is dull, there is a hopeful note pervading their utterances. Trade on the Continent is marking time and the revolutionary spirit seems to be sweeping over Europe, retarding construction and extinguishing the spirit of enterprise.

In regard to the future, the "Timber Trades Journal" says: "We are not optimistic enough to think that labor troubles are over, or even on the wane, but provide the only revolution preached is revolution of the peaceable order, we need not despair because of the growing power of the working classes. House-building still lags behind other trades, and consequently the demand for timber is only moderate, but in the meantime there are many other industries which are consuming large quantities of wood, and which are experiencing a very busy time. Unfortunately, it is just house-building timber which is so plentiful, while Archangel wood for shipbuilding, yellow pine for engineering, etc., are extremely scarce and dear. Sawmills are pretty fully employed owing to the growing demand for cases and boxes; for whitewood in the broader dimensions there is an active inquiry. Whitewood deals are particularly scarce.

The Government Timber Buyer's Department will in future be known as the Imported Timber Disposal Section, Board of Trade, and we understand that the selling of the Government stocks will be carried on as hitherto at Salisbury House. Since March, when Government buying ceased, it has been a misnomer to speak of a Government timber buyer, and it will be satisfactory to the trade to observe the first signs of the demobilisation of the of the Timber Supplies Department, and to realise that the hold exercised by the State over the timber trade is on the wane.

The needs of Europe for timber are more urgent than ever, and Continental importers are on the qui vive in order to be ready to take advantage of opportunities as they arise. During the coming winter the Continent will not be so well supplied as Great Britain with imported timber; but on the other hand, she is less ready for the material. Holland and Denmark overrated the position in the early days of the season, and had to unload a good part of their purchases on other markets. France and Belgium have bought sparingly, and unless depression in trade is very severe next winter there will be a good outlet in 1920 for imported timber in these countries.

In regard to market prices and prospects, it is interesting to read the following from an exchange: "In the timber trade especially—a trade in which long views must be taken—doubt as to the

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

future makes the business of the merchant most harassing. It is not that merchants have suddenly lost their faculty of foresight or of judging of such matters as the probable supplies of timber in the future, the probable extent of the consumption, etc. All this to the experienced merchants is more or less plain sailing; and in any case most established firms would be quite willing to use their business instinct and back their considered opinions. But when they have to take into account political factors, their confidence fails them, and most feel that their only refuge is in a policy of masterly inactivity. A fortnight ago we referred to the fact that the usual autumn negotiations for the ensuing season had not commenced, and we have not yet heard of any pourparlers for 1920 goods. And yet in Great Britain many merchants speak as if it were a matter of course that free-on-board prices in Scandinavia would remain absolutely firm, and in all probability advance. Swedish exporters openly state that they expect to make in 1920 at least another £2 per standard on this year's top figures, and the arguments they use to support their view seem pretty conclusive—the world-shortage of timber, the growing consumption, the urgent need for sawn wood after the war of destruction, the elimination of Russia as an exporting country for another two years, the extraordinary high cost of production, etc.—all these are very strong reasons for the maintenance of sawn wood at at least its present level of values in the exporting countries. Leaving the question of freights out of accounts for the moment, as we are dealing with free-on-board values, why then, we may ask, should there be such an absolute lack of interest shown in forward contracts? The explanation, we believe, is political rather than commercial; and we fear that uncertainty in political matters will remain with us for some time."

United States

During the past few days interest has been largely centred upon the steel strike and the outcome of the railwaymen's strike in Great Britain. This has naturally detracted somewhat from the even, steady tone of business, and in various cities too there have been labor troubles, which have interfered to some extent with ordinary merchandising and distribution. Different reports come to hand, depending very much upon the localities from which they emanate. In Buffalo it is declared that trade has been very brisk for the last two or three weeks, while in Boston there were practically nothing doing at all owing to the policemen's strike.

Writing to the "Canada Lumberman" regarding conditions at the Hub, a leading firm says: "The strike of the police, together with the upheaval in labor all over the world, has put a check on business. We look for a proper solution of the labor situation in the near future, after which we expect to see a good market for commodities and a general improvement in business. We might mention there have been some shipments of spruce in this market within the last two or three weeks which have been sold at considerable concessions. This naturally hurts the market temporarily. The same situation has affected hemlock boards and other kinds of lumber."

As the Fall months advance building naturally becomes quieter and fewer permits are taken out. There is plenty of work still to do, however, in finishing the work that has started, and the prospects are that work will be resumed next year on an even larger

scale. The country is still way short of adequate housing facilities, and it is quite likely that there will be more than usual activity in the cities where building operations are carried on throughout the colder months. Country building will probably drop off with the first appearance of severe weather.

Some building has been deferred because the projectors believe that construction work will be cheaper. Some has been put off because builders could not get materials. But the outlook is not especially good for any great change in either respect.

High wages for labor have come to stay. There may be some recession from the present high level, but there will not be a return to the level which prevailed before the war. Labor, in the manufacture of the raw material, in the production of finished goods and in actual construction work, is the chief item of cost, and while labor remains high little drop in prices can be expected.

As for supplies, the outlook is no better. The lumber industry never before faced a winter with as little surplus. In no producing districts and at no individual mill is there the usual supply of stock for this season of the year. Manufacturers will make an effort during the coming winter to prepare for an active sawing season next year, but scarcity of labor will interfere with their plans, and the supply of lumber next season is also likely to be inadequate to supply the demand.

Supply and demand govern the material market, and if the matter of production costs did not enter into the question, prices would still be strong. But with a shortage of labor, and with high wages paid to labor, cost will be a factor in the lumber markets which cannot be escaped.

Distribution centers for hardwoods report that the demand is not as strong as recently, a condition undoubtedly due to the steel strike and other labor disorders. The unsatisfactory outlook in the labor world brings a marked degree of caution, which, together with the falling off in exports, is expected by many dealers to bring an early recession in prices. But such a development appears very unlikely when the situation surrounding the production and marketing of hardwoods is viewed in its true light. As indicated, there has been a slight recession in the demand, yet it remains very active and more than enough to cover everything produced with large-scale industrial consumption the largest factor. Quartered and plain white oak is the market feature, with red gum and poplar also moving especially rapidly. There is a very active demand for veneers; likewise for box boards. Flooring and interior trim mills are running full time, with enough orders right now to cover several months' production; and sash and door plants are also very busy. Reports from furniture manufacturing centers state that extensive additions and new plants are being erected with all possible speed and that other arrangements to facilitate a speedier and larger production are under way. The manufacturers expect a large volume of future business, and are preparing for it. Agricultural implement and vehicle manufacturers have the same prospects, and the automobile plants report an unprecedented demand for cars of all descriptions. Industries, taken all together, report orders ahead for four to six months, and in some cases a year, with plenty of business in sight after that. The hardwood situation is strong in view of the present and prospective demand alone, and additionally so in view of the curtailed production.

Market Correspondence

SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD

Good Steady Demand Reported at Ottawa

Continued firm prices, a steady demand with orders keeping up and stocks remaining about the same were the feature of the Ottawa lumber market during the opening period of October. As compared with the latter part of September the market showed little or no general change locally. Lath and shingles continued to remain scarce and both advanced in price. No. 1 white pine lath went to \$8 per thousand and all grades of shingles showed a general advance of about fifty cents for the same quantity.

Taken all around the market was good for this time of year and though the general volume of business transacted was not as large as that done during the pre-war years, manufacturers and others of the trade were optimistic and looked for a "fairly good" business, even into the winter months. The principal reason given for the volume of business not being as great was on account of the cutting off of the war demand for shell box and other stocks for war purposes and because existing stocks are not proportionately as great as in 1914-15 and years before. Consequently, it could hardly be

expected that with lowered stocks the manufacturers and others could dispose of or turn over as great a quantity.

Of the factors effecting the market little could be determined but taken all around the situation appeared satisfactory to the lumbermen. The export situation to Great Britain and Europe was, of course, the most interesting. This did not show any improvement but rather if anything became less favorable on account of the British railway strike.

During the strike ships reached British ports and were tied up. There were few ships coming back. Consequently there was so much less available cargo space for lumber shipments or anything else," was the terse summary of Mr. P. C. Walker, of the Shepard and Morse Lumber Co.

Outside of the British export situation, transportation of lumber shipments to South America or South Africa showed no change. A difference of opinion existed about the number of foreign cars available. Some shippers were of the opinion that the situation taken all around was better in this regard than what it had been last year

at this time or the year before. Others mentioned that foreign cars were beginning to grow short.

"The cars may be getting a little scarcer all right but they are a great deal more plentiful than they were this time two years ago or last year," commented another shipper. There the situation stands.

The woods reports indicate that operations with some companies and camps are only getting on moderately well, on account of there not being all the labor that is required. "The thing is that that there is lots of labor to go to the bush. It is a question of keeping them there after they arrive," commented Mr. Walter Ross, of the John R. Booth firm, Ottawa. The "Canada Lumberman" was informed that the great trouble being exercised in the camps this year is what is known in lumbering or camp parlance as "transients"—i.e., men who shift quickly from one camp to another.

This shifting on analysis has a serious effect on production as well as being very costly to the companies or operators who send the men into the woods.

With the latest advance in lumber prices as contained in the last issue of the "Canada Lumberman," some comment arose at Ottawa to whether or not it was the high price of lumber which was retarding building operations. Lumbermen pointed out that this could hardly be the case, as lumber was one of the last commodities to increase with the war. It was further stated that even supposing ten thousand feet of lumber was used in the erection of a house and the advance had been \$20 per M., that would only mean an increased item of cost of \$200. Again it was mentioned that lumber was only one of several commodities that enter into the present day or modern structure. Heating, plumbing and steamfitting was cited as an instance by a lumberman who stated that including the cost for installing had advanced six hundred per cent against lumber's estimated \$20 per M. increase.

The situation with the sawmills remained pretty much unchanged. The majority of mills in the valley will run as late as they can this season or so long as their supplies of logs hold out. So far there has only been two mills reported closed down, they being the Shepard and Morse mill and that of McLachlin Bros., at Arnprior. The Gillies Bros. mill, at Braeside, which was destroyed by fire some time ago is, of course, out of operation and steps are now being taken to reconstruct it. Mill and factory labor remained good.

With the woodworking plants and factories business kept up well, and no serious signs presented themselves to indicate that a general slump in business was to occur soon.

Montreal Business Shows No Material Change

On the whole, business in Montreal is slower. Local trade is dull, owing to building conditions; the orders for the U. S. show signs of falling away; and the B. C. market is quiet except for dimension stock. Prices, however, are very firm. Despite the lull in business, the general outlook is regarded as satisfactory. The commercial position is sound, and there is no indication of any fall in prices; on the contrary, the opinion is that we shall see a higher range of values.

The easing off in the U. S. demand is probably due to the rather unsettled conditions due to the labor troubles. These are calculated to interfere with building, and with the buying of lumber.

The B. C. market is adversely influenced by the dearth of stock. The mills in the West are very busy, filling orders for American account, and prices are exceptionally stiff.

Local trade continues to be more or less hampered by the strike in the building industry, particularly as the carpenters are mostly affected. Many of the men have returned to work, but at the time of writing a considerable number are holding out. These want an advance from 60c to 75c an hour, with an eight-hour day. In spite of this handicap the building permits continue satisfactory. For September the total was \$1,050,976, an increase of \$770,651; for the year to date the total was \$6,964,644, a gain of \$2,976,441.

Box makers are tied up owing to a strike, and many of the factories are closed. The men demanded an increase of 20 per cent. in wages, an eight-hour day, and union recognition. As these requirements were not immediately met, the men walked out.

The pulpwood section shows a hardening tendency. For a time American mills bought in very small quantities, believing that prices would fall. This was due, according to a dealer, to offers of large quantities of wood by irresponsible brokers, who failed to deliver anything like the amounts specified. The prices quoted were comparatively low. The general impression given was that there was plenty of wood, whereas the quantity is limited, as little was taken out by farmers last season. The mills are now coming more freely into the market and prices are improving.

The lumber export position is about the same, except that freights are inclined to be easier and more space is available. Very little Government lumber remains to be sent from this port. The stocks to be lifted in the Maritime Provinces are very heavy, and this will be shipped during the winter.

The exports of pulpwood continue to decline. During July the total was \$1,234,527, a decrease of \$1,019,357; while for the four months of the fiscal year the total was \$3,260,241, a falling off of \$2,972,013. In July exports of paper were substantially higher, but chemical pulp was \$100,000 lower at \$2,654,333, and mechanical pulp \$26,000 down at \$435,604. During the four months, chemical pulp declined \$5,225,530 and mechanical \$70,572. Paper, however, was \$3,045,299 to the good.

Norwegian Wood Trade Faces Difficulties

In regard to the Norwegian wood trade C. E. Sontum, Canadian Commercial Agent at Christiania, Norway, says: "Business in the export market is still dominated by the dearth of tonnage, and substantial quantities sold for shipment May and June are still left to wait for shipping opportunity. This belated delivery of sold goods is mainly caused by delays of the boats owing to strikes and slow forwarding at the places of discharge, supplementary tonnage being difficult to procure. Prices are maintained firm with a rising tendency. With shorter working hours and diminished output the mills are also by necessity in want of higher prices, as the cost of raw materials is showing no decrease. The demand, mainly from England, is well maintained and the competition from Finland, however, especially in sawn goods, appears to make itself felt in some quarters, buyers keeping back in expectation of a more plentiful supply from that country, but as shipping accommodation will hardly prove easier to obtain in those waters, the importance attached to the supply from Finland may turn out to be illusory. The Belgian market, of which much was expected, has not yet developed to anything important. Holland at present is also lifeless. Some few feelers are sent out, but as a rule the orders are being covered more cheaply from stocks within the country. Australia meanwhile has appeared as a buyer on quite a fair scale, and several transactions have been made in planed goods at prices of about £28 10s. to £29 per standard basis f.o.b.

"Owing to the difficult shipping conditions and the slow clearing of stocks consequent thereon, there is no business to speak of in the battens market. Prices are, however, maintained at about the former level."

The Moral Fibre of the Lumber Man

All lines of business at times offer temptations and afford opportunities for crooked dealing. Perhaps the lumber business offers its full share of such; but it is believed that the buying and selling of lumber in general are done honestly. At any rate, association membership, systematic grading and official inspection are designed not only to sanction honestly but to eliminate temptations to crookedness. The so-called lumberman who violates the ethics of the trade is soon made to feel very lonesome in his isolation, says the "American Lumberman."

However, there are two conditions of the lumber market that tempt the buyer in one case and the seller in another and bring about practices that are not sanctioned by the better class of lumbermen in any branch of the industry. When the market is falling it is temptingly easy for the buyer to cancel contract orders; and it is temptingly convenient when conditions are reversed for the seller to delay or divert deliveries on such orders. With demand as it has been in recent months and with supply not within hailing distance of demand the eager buyer is likely to be suspicious of delays in delivery. On the other hand, if the market should decline reluctance on the part of the buyer to accept delivery might cause similar suspicions in the mind of the seller.

Nobody really wishes to put the lumber business on this "catch-as-catch-can" basis, and the suspicions developed by such practices are demoralizing to the trade. Plain speaking would demand the application to them of terms that require no explanation or definition. The lumber industry as a whole is above sanctioning them, for when a balance is struck for the whole industry they leave no profit in money but a big loss in character. A few buyers and a few sellers make a little money at the expense of a few other buyers and sellers, and to the discredit of the whole trade.

The chief end and aim of all forms of organization and of all education are to bring about fairer dealings among men, to inspire loftier ideals and to raise all human relations to a higher level. This is only a manifestation of foresight, real wisdom; for the true interests of every person engaged in industry are best served by the enforcement of ethical laws. With the lumber industry in an unstable condition the moral fibre of the individuals engaged in it is being put to a test. Evidence is plentiful of a desire to meet that test by the fulfillment of every moral obligation, cost what it will. The few exceptions to the rule merely serve to mark defects that the industry will find means to cure in due time.

To the Lumber Companies of Canada:

You have the Goods. Place your Lists with full particulars in our hands. We are in daily touch with all the Buyers in the United Kingdom.

PLEASE NOTE. We pay cash against all documents, and take the whole of the Delcredere risk on Buyers.

The British Paper Markets are Your Opportunity

Establish a market for your paper stock now and it will be a great asset to you in after war trade with Great Britain. We can make very advantageous contracts for Canadian paper of all kinds and especially newspaper stock. This is a big opportunity for Canadian mill men. We are the largest paper makers' agents in Great Britain and will be glad to hear from manufacturers interested in export trade.

Write us to-day.

EDGINGS

Ontario

The Dominion Lumber & Coal Co. will shortly erect a planing mill on Rosslyn Ave., Hamilton.

Several young men from Toronto and vicinity, who were attracted by the high wages offered in the lumber camps and went north for a few weeks to engage in logging operations, have returned. They report the work heavy—a real man's job.

The will of the late Hiram Robinson, well-known lumber man, of Ottawa, who died recently, bequeathed \$100,000 to the city for the new hospital. The stipulation is made that the grant is to be used within a specified time for the children's ward.

An examination of candidates desiring to be licensed as saw-log cullers was held recently in Kenora. It was announced that there would be no further examinations this season and only British subjects and bonafide residents of Canada were examined for licenses.

The many friends of W. D. Cargill, M.L.A., one of the lumber legislators of Ontario, will sympathize with him in the loss of his home, in Cargill, which was recently destroyed by fire. The residence was one of the finest in Western Ontario and the loss is estimated at \$30,000.

The Conger Lumber Co., Parry Sound, Ont., have finished sawing for the present season and are now operating several camps in connection with their logging operations. The company cut about 5,000,000 feet of hemlock this year, which is an increase of about 25 per cent. over the production in 1918.

Fire broke out in the dry kiln of the large planing mill of Philip Amant, Brussels, Ont. The fact that the kiln was completely filled with heading made the work of fighting the flames more difficult. Assistance was sought from outside towns and the fire was kept confined entirely to the dry kiln. The loss is covered by insurance.

The Wagar Furniture Co., Limited, with headquarters at North Bay, and capital stock of \$40,000, has been incorporated to manufacture all kinds of furniture, wood, tin and metal wares and to conduct a general furniture business. Among the incorporators are Walter S. Wagar, Harvey A. Heavener, John Blanchet, all of North Bay.

The Marshay Lumber Co., of Toronto, have bought the saw mill and limits of La Forest and Clemow at La Forest on the Canadian National Railways, about fifty miles north of Sudbury, Ont. The mill was erected last year, and is equipped with a double cutting band and has a capacity of about 50,000 feet a day. The timber on the limits is principally white pine with a sprinkling of jack pine.

Lumber and Pulpwood of British Columbia, Limited, with a capital stock of \$1,000,000, and head office in Toronto, has been granted a charter to manufacture, buy, sell, import, export and deal in timber, lumber, wood, pulpwood, fibreboard, pulpwood, etc., and to buy, sell and develop timber limits. The incorporators of the Company are given as Frederick H. McCallum, F. M. Squires and Russell P. Locke, Toronto.

A federal charter has been granted to Telbax of Canada, Limited, with headquarters in Windsor and capital stock of \$300,000. The company is empowered to originate, compose and advise forms of advertising, and to conduct any other business pertaining to printing, lithographing, stationery, account book making and to carry on the business of importers, dealers and manufacturers in paper, pulp and paper substitutes of all kinds. Among the incorporators of the company are J. C. Scofield of the Windsor Lumber Co., Limited, Windsor, Ont.

A large number of sawmills have already closed down for the season, some of them a few days earlier than usual. McLachlin Bros., Arnprior, have found that owing to the low water in the Ottawa River it was impossible to bring down a further supply of logs to the sorting booms, and every foot of the vast quantity of timber in the booms had been cut up. McLachlin Bros. intend making a number of changes during the coming winter in their sorting tables and installing more modern methods with a view to economy of time and labor.

G. Kastner, J. E. Murphy and others have made a proposition to the council of Wiarton, Ont., with a view to purchasing the flooring factory and operating it to full capacity as soon as arrangements can be completed. The casket factory, which has long been vacant, may also be converted into a furniture manufacturing plant in the near future. Capt. R. L. Graham, who returned recently from overseas, has purchased the site of the Johnson, Hunter, Crawford mill, and it is possible will erect early next year a sawmill and woodworking plant on the property.

The Fesserton Timber Co. of Toronto have finished their cutting operations for the season at Monteith and Haliburton. At the mill operated by them at Montreal on the Driftwood river, about 4,000,000 feet of spruce was sawed and considerable pulpwood taken out. At Haliburton, where Austin & Roberts' mill sawed 1,500,000 ft. for the company, the bulk of the output was hemlock, although there was a fair sprinkling of hardwood. The Fesserton Timber Co. report the lumber situation as very strong at the present time, and they are looking for a continuance of the present high prices for, at least, a considerable time.

A charter has been granted to the Triangle Lumber Co., Limited, with headquarters in Toronto, and a capital stock of \$500,000. The company is empowered to manufacture, sell and deal in lumber and sawmill products of all kinds, acquire timber limits and standing timber and to manufacture pulp and paper, etc. The company will acquire the limits and camps of Boivin, Black and Jemmett of Haileybury, as well as a controlling interest in the business of James Kingston. The officers of the Triangle Lumber Co. are: President, J. H. Black, Toronto, Vice President, Matthew Boivin, Haileybury; Secy.-Treas., D. L. Jemmett, Haileybury.

Tenders were recently received in Ottawa for the pine, spruce, cedar and tamarac timber on the Indian Reserve at Lac La Croix in the Rainy

River district. The successful tenderer was required to deposit a sum of \$5,000 as a guarantee for the proper carrying out of the undertaking and a sworn return by a licensed culler of the material cut each season. Seven years are allowed for the removal of the timber under an annual license, and all brush, treetops and other debris resulting from lumbering operations must be piled and burned during the winter months. Tenderers had to state the price they would offer for the merchantable pine, spruce, cedar and tamarac on a stumpage basis per M feet, B.M., over and above the Crown dues, at the usual tariff.

Eastern Canada

The Canada Fibreboard Co. was recently registered at Quebec, P. Q. J. A. Culligan, lumber manufacturer, of Benjamin Mills, N.B., was on a business visit to Montreal, recently.

The sawmill of the River Valley Lumber Co., Ltd., Oromocto, N.B., was totally destroyed by fire. The loss is partially covered by insurance.

The St. Maurice Lumber Co., Three Rivers, Que., intend erecting a two-storey office building at a cost of \$20,000. The plans for the structure have been prepared.

The Kipawa Fibre Co. Limited, will erect thirty new houses on the townsite of their new sulphite pulp plant at Temiskaming, Que. The dwellings will be for the employees of the mill.

The assets of Paul Demers, sash and door manufacturer, Montreal, were sold by auction on October 3. The factory, machinery and other property were bought by Mr. E. Guiment, Montreal.

The Wayagamack Pulp and Paper Co. Three Rivers, Que., intend installing additional machinery and will increase their output of kraft paper by about thirty per cent. Orders for the equipment were recently placed in England.

The Canada Paper Co., Limited, of Windsor Mills, Que., who several months ago purchased the St. Anne river limits, now have forestry parties out surveying the timber and laying out working plans, but do not expect to start cutting operations until next season.

The Brompton Lumber Mfg. Co., Bromptonville, Que., has been incorporated with a capital stock of \$49,000, to carry on a lumber business, and to manufacture and deal in wood products of all kinds. Antoine Fournier, mill manager, of Bromptonville, is one of the incorporators.

The Laurentide Co. of Grand Mere, Que., have awarded the contract for two paper machines each of 166 inches width. The machines will be built by the Dominion Bridge Co., Montreal, and when in operation, will increase the newsprint output of the Laurentide Co. to 360 tons a day. An extension of 320 x 90 feet, two storeys high, will be built to the present plant to house the additional equipment.

Fire broke out recently in the sash and door factory of the Kent Lumber Co. at Granby, Que. The loss was about \$10,000, and the insurance \$6,300. The cause of the blaze is believed to be due to spontaneous combustion. The plant was completely destroyed, but it is understood that Mr. Solomon, the proprietor, intends to rebuild. In rescuing his books from the office he had a narrow escape and received some painful bruises about the hands and face.

The new Kipawa sulphite pulp plant of the Riordon Pulp & Paper Co., which is being erected at Temiskaming, Que., is rapidly nearing completion. Construction work is practically finished and the machinery is now being installed. The power house and power development should be in operation in a few weeks' time. The Kipawa mill will be turning out 30,000 tons of bleached sulphite per annum, and will be running early in the new year. This is the first unit of 100 tons, and it is understood that a second unit will be proceeded with early next year.

Western Canada

The Haywood Lumber Co. is erecting sheds and offices at Radway Centre, Alta.

Laden with 1,250,000 feet of lumber for South Africa, the American barquentine, Conqueror, recently left Victoria.

The C. E. Walsh Lumber Co., of Vancouver, is now in operation and has already cut a large amount of lumber. A new engine and boiler room was recently completed.

Among recent incorporations in British Columbia are the Coast Box Co. Limited, the Kelly Laké Lumber Co., Limited, the Thomas Gwilt Shingle Co. Limited, and Western Hemlock Mills, Limited.

Fire believed to have been due to spontaneous combustion broke out recently in the sawdust storage building of the Vancouver Lumber Co., Ltd., Vancouver. Damage was done to the extent of about \$10,000, and at one time the blaze threatened to spread throughout the yards.

The Tait Lumber Co., Langley, B.C., have received an order for a large quantity of B. C. maple, which will be used in the manufacture of furniture. British Columbia maple differs in a marked degree from the Eastern product, it being softer and much shorter in the grain.

A total of 19,776,814 feet of lumber was shipped from British Columbia ports in August. Nearly seven and one-half millions of this amount was forwarded in French vessels. Nine of the wooden ships built at Victoria for the French Government assisted in this work. Large consignments will also be sent to France.

The A. A. Rerrie lumber mill, north of Shortreed, B.C., on the G. N. R., are adding improvements to their plant and building and a light logging railway to the nearby timber limits. The mill is cutting about 26,000 feet per day, but the shortage of cars is proving a drawback to their operations. The mill is run by electric motive power.

It is believed that great quantities of lumber now being forwarded from British Columbia ports will go toward reconstruction undertakings in Egypt. The revolt there resulted in a tremendous amount of destruction to railway buildings and equipment, station houses being burned, bridges destroyed, tracks torn up and ties ruined.

Major Cowper-Young, who was formerly connected with the Dominion Spruce Board in aeroplane construction, will establish a shingle and planing mill at Prince Rupert, B. C. Major Young has let the contract for the dry kilns and refuse burners, and says he hopes to show the world that on Queen Charlotte Islands they have better pine than anywhere else where pine is grown and cut.

Stop Advertising and You're Forgotten

HOW long do you think your good-will is good for, if left to itself? The public has a short memory. Are you willing to risk its forgetfulness—even to invite it? Figure it out in dollars and cents. Can you afford it?"

**Reasons
Why
You Should Use**

ATKINS STERLING QUALITY SAWS

Reason No. 1 -- Atkins Steel

THE sterling quality of Atkins' superb saw steel is in itself an all sufficient reason for the exclusive use of Atkins' Saws. True steel like pure silver shows the quality of its metal when put to the real test: Atkins is found to be as true as it is possible to make quality tool steel. Free from flaws and seams, it is fashioned with consummate skill, and in the heat of the forge proves itself the ideal metal for the ideal saw. Comparison will confirm our quality claims.

MAIN BELTING COMPANY OF CANADA,
LIMITED.
LEVIATHAN AND ANACONDA
MONTREAL. TORONTO.
10 ST. PETER STREET,
MONTREAL.

Gentlemen:—

Sept. 25th, 1919

You will be interested to know that we will shortly have off the press our new 150-page reference work on Power Transmission, Conveying and Elevating.

This book is, throughout, the production of technical experts of broad, practical experience. No time or expense has been spared to make it the most complete and useful reference work of the kind ever issued in Canada.

It is profusely illustrated with reproductions from actual photographs and original drawings, and contains a number of carefully prepared rules and tables for the information and guidance of belting users. Contents are conveniently arranged, and a comprehensive index is included.

The volume is printed on fine paper and is substantially bound, de luxe, loose-leaf style. Our aim has been to make this a valuable and permanent addition to any manufacturer's office library.

I will be pleased to forward you a complimentary copy, carrier charges prepaid, upon receipt of your request on your firm's stationery. The edition is limited.

Very sincerely yours,

Main Belting Company of Canada, Limited.

D. E. Parker
Managing Director.

A REAL GUARANTEE

Our responsibility for each LEVIATHAN and ANACONDA Belt extends beyond payment until the belt has earned in actual service its full cost as compared with the service of any other belt of any kind, under the same or similar conditions, barring accidents.

We regard this as the only guarantee that is fair to the buyer.

Tires Led the way to Better Hose

THE hose industry stretches back into the early days of rubber history.

For year after year rubber hose had been built upon the immature principles of those early days.

But Goodyear has developed new and higher standards of hose efficiency.

Just as broad-visioned Goodyear chemists and engineers cut loose from tradition and built tires in a better way, so have they built industrial hose.

Old processes—obsolete methods have been forgotten. Only those processes, formulae and methods proved by service tests and experiment to be best enter into the manufacture of Goodyear Industrial Hose.

Hose linings which do not crack or harden have been developed.

Outer covers with an exceptional degree of toughness to withstand the

wear of severe industrial service—another distinctly Goodyear feature.

In a word, Goodyear has built better hose. Original cost did not count if greater final economy and increased efficiency were a sure result.

You cannot know how far short of complete satisfaction ordinary hose falls until you experience the greater perfection of Goodyear Industrial Hose.

Give Goodyear Hose a trial now. There is a particular Goodyear Hose for every industrial purpose—water, steam, pneumatic tool, air drill, railway, fire, suction, etc.

Phone, wire or write to the nearest branch for a man trained in hose problems to study your needs. No obligation.

The Goodyear Tire & Rubber Co. of Canada, Limited

Halifax, St. John, Quebec, Montreal, Ottawa, Toronto, Hamilton, London, Winnipeg, Regina, Calgary, Edmonton, Vancouver.

GOOD YEAR

INDUSTRIAL HOSE

CANE MOLA

Not a prepared stock food—just 100% pure cane sugar molasses. The good old kind that the lumber jack himself likes. You may think it odd to feed the horses what you used to buy for the men, but results have shown that

HORSES FED WITH CANE MOLA

are free from colic, will winter at hard work and finish in excellent condition in the Spring. It contains just enough natural salts to keep your live stock in healthy condition, and that's why it's good for the men, too.

Shipped in Strong, Iron-Hooped Barrels

Note the analysis on barrel.
Use Cane Mola for the men.
Use Cane Mola for cooking.
Use Cane Mola for the horses.

Write for information and booklet.

The Standard Hoist for Loading and Skidding Logs

Made with either one Drum, or two Drums, as shown, and in seven sizes, from the little 10 horse power machine to the massive 50 horse power size.

LABOR IS COSTLY

Yes—More Costly than Machinery

Labor costs are entirely too high now to warrant you in using hand power in any place whatever where steam, or electric or gasoline power can be made use of.

Why not reduce as much as possible the drudgery of moving logs by making use of the machinery which experts have devised for

the purpose. Not only will your work be done much more easily and quickly, but you will find a great saving effected in your operating costs.

We make many types and sizes of LOADERS and SKIDDERS, and among them is the right kind and size for your work.

Let us send you a copy of our Book "Suggestions for the Lumberman," showing many methods of using Loading and Skidding Machinery to increase output and reduce costs.

"Acme Waterproof" Leather Belting

This brand is especially well suited to the wet places in a saw or pulp mill and will run true as long as it is in service. When you are overhauling your mill equip it with "Goodhue Belts" and you will never regret it. They are honestly made of solid leather—every inch a good belt and they won't stretch.

Ask any Filer about
the quality of Disston
Crucible Steel—made
in the Disston Works
since 1855.

AN "ALL DISSTON" MILL.

It is very frequently found that every saw in use in a modern, efficient mill is a Disston.

In fact, after Disston's 80 years of leadership, it could not well be otherwise.

Wherever lumber is produced, it is known and acknowledged that Disston Saws represent the maximum in quality and in true-cutting, profitable service.

— Sturtevant Supremacy —

For upwards of sixty years the name Sturtevant has been pre-eminent among makers of air-moving apparatus. More Sturtevant apparatus is now in use than all other makes combined. Isn't that fact significant? All Sturtevant products are built to an ideal based on—

— Quality—Efficiency—Economy —

ANNOUNCING A

NEW DRY KILN

WHICH PREVENTS

Casehardening

Checking

Splitting

Honeycombing

**MINIMIZES SPOILAGE!
SAVES TIME!**

With practically no spoilage—the new Sturtevant kiln dries wood in a few weeks where old, crude, inefficient methods consumed months and even years.

Rugged construction insures reliable, continuous service. Compartment type design permits easy and frequent tests and individual treatments. Temperature and humidity automatically controlled. Circulation of air positive. Built to your specifications. Without obligation—our engineering and kiln experts will advise you.

BOLINDER'S

HEAVY CRUDE OIL ENGINES

Built by a Firm Who Stands Supreme in the Whole World as Oil Engine Experts

In Sizes of
10-160 B.H.P. 2 cyl.
240-500 " 4 cyl.

The Bolinder is the most economical and efficient propulsive power for

Tow Boats and Barges

It operates at a cost of only $\frac{1}{2}$ cent per Brake horse power per hour—an enormous saving as compared with steam. It dispenses with firemen—thus reducing the wage and food bills.

SIMPLE, DEPENDABLE, DURABLE

The Bolinder is extensively used in the British Navy. Some 300 Bolinders were ordered during the War by the Admiralty, some of them for Monitors patrolling the Flanders Coast—a remarkable tribute to the high qualities of the engine.

Over 13,500 Bolinder Engines equal to 650,000 B.H.P., are in successful service in all parts of the World. In Canada and the United States, the Bolinder propels vessels aggregating 175,000 tons D.W.

The Ideal Edger for Light Mills

Specifications

Our new Double Edger is built on entirely new lines, and possesses many features that commend it to mill men. The saving in material alone will soon pay for the machine. The output of a mill with this machine can be increased by one-third. It is best adapted for medium-sized or portable mills that cut from 5,000 to 25,000 feet of lumber per day.

SAWS—This Edger is fitted with either two or three saws as required. The saws are 16 in. in diameter, and 10 in. gauge. The greatest distance between saws is:—Two saw machines, 24 in.; three saw machine, 20 in., the least distance between saws, 2 in.

DRIVE PULLEY—The Drive Pulley is 9 in. x 9 in., affording a good belt grip, and is supported by an outside bearing.

SAW ARBOR—The Saw Arbor is made of 2½ in. steel, and has very wide bearings.

USE KLIM -Separated Milk Powder, for its Economy

SEPARATED milk contains all the nutritious value of whole milk, except fat, and costs much less. Sufficient fat is consumed in other foods such as meats, butter, shortening, etc., to supply a well balanced diet.

TO get fresh liquid separated milk into a lumber camp is almost an impossibility. About 87 per cent. of milk is water. This is what makes shipping so expensive and precarious. As long as the milk solids are in solution bacterial action will take place, but when the water content is removed such action ceases entirely.

OUR exclusive "spray process," by which fresh liquid separated milk is reduced to a fine dry powder without in any way altering the flavor or food value of the solids, makes possible an un-

limited supply of fresh separated milk in your camps and boarding houses at a low cost. A case of Klim containing 6 ten-pound tins is equal to 60 gallons of fresh separated milk. Klim can be shipped by freight, for, being dry, it will not sour or freeze. It can be used as needed from the tin.

FOLLOW the directions on label when using Klim. Use the exact quantity required. Place Klim on top of a bowl of water and whip briskly until dissolved.

ALL wholesale grocers and supply houses sell Klim in 10-pound tins, 6 in a case.

WRITE direct to us for booklet "The Wonderful Story of Klim" and trial tin for use in your own home.

Kendall Gang Circular

The Machine that will convert your small logs into more and better lumber, quicker than ever before.

The illustration shows one of the latest designs of gang circular patented by Mr. I. N. Kendall, the well-known millwright, of Ottawa. This machine takes 16-26 in. diam., 10 gauge saws—will cut cants up to 8 inches in thickness, and we furnish with it necessary saw collars for any thickness of lumber desired. It has a hollow mandrel, water cooled saws; each saw has a separate guide; easily accessible and readily adjustable, and the bridge tree is so designed that it can be removed, the saws taken off and a new set put on in 7 to 10 minutes. Safety fingers hung just inside the front press roll prevent a cant flying back off the saws. Lumber cut on these machines is guaranteed to come out absolutely true to size from end to end, and so smooth that 1/16 in. over size is all the allowance necessary for finish.

Read what one user says about it:—

"The machine has given every satisfaction and in many cases far exceeded my idea of sawing lumber; the proof of this being that our customers are paying me \$1.00 to \$1.50 per thousand more for certain classes of lumber than they can purchase same quality elsewhere—this advantage being purely on account of the uniform and smooth sawing this saw is capable of doing."

We are the original manufacturers of these machines

We have been manufacturing them for the past fourteen years, and the experience gained in all those years is at your disposal. We make these machines in three sizes, as follows, using

- 26-in. saws for 8-in. cants, as illustrated.
- 32-in. saws for 10-in. cants.
- 36-in. saws for 12-in. cants.

Each size is of the very latest design and up-to-date in every improvement.

May we send you a list of satisfied users?

We also make a complete line of twin circulars with chain or steam feed for slabbing logs for these machines.

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

A Rugged Pulley-Gripper

SparOak is a two-in-one belt combining rugged strength with unique pulley-grip.

Two kinds of leather enter into a SparOak Belt. The outer ply is oak tanned, cut from the best selected center stock. The ply next the pulley is Graton & Knight Spartan leather, tanned to give pliability and traction power unequalled by any other material.

SparOak Belts grip from the start and they keep on gripping for years under adverse conditions. They withstand repeated

SparOak Belting

Here is an 18" SparOak Belt on a hard drive in a warm, moist atmosphere where the extreme flexibility of Spartan and the firmness of Oak leather are necessary.

If you have a troublesome belt drive, consult us as to what belt is required. Maybe it is SparOak, but in any event one of the Graton & Knight Standardized Series of Belts will fit exactly. Write for our booklet on Standardized Belting.

shifting, and the wear against step cone or flange pulleys. They render efficient service on drives with high speeds, small pulleys, and heavy loads. In short, any of the factors that quickly wear out ordinary belts affect Spar Oak belting amazingly little.

Manufacturing All Kinds of Special Shapes in Refractories

Remember, we are making all our own blocks and making a specialty of special shapes.

We are using a high grade fire clay, which is the factor of supreme importance in all processes of manufacture. Our burners are experts. When you are in the market be sure and write us as we know you will find our proposition interesting.

Our stoker arches are designed to promote combustion and give longer life.

Our door arches and jambs are made to withstand the

strong-armed boy with the slice bar.

Our side wall blocks are made to eliminate the many joints that clinkers stick to, when ordinary fire brick is used. They give longer life and reduce air leaks to a minimum.

We designed these arches and blocks so that any handy man could replace same in half the time that it takes to repair a standard fire brick job.

Remember, Gates' blocks means cutting your cost of upkeep and fuel bills.

High Temperature Fire Clay for Emergency Repairs.

We specialize in all kinds of POWER PLANT BRICK WORK

Call on our engineers at any time for information you may require; their services are offered to you without obligation.

Alaska Double-Deck Bunk

When You Use "ALASKA" Double-Deck Bunks

YOUR men work harder and more steadily, because at the end of the day they can utterly relax with entire comfort on these sanitary steel bunks. The twisted link fabric springs have just the proper amount of tension to "give" without sagging. They support the body in a perfectly normal position, and when overlaid with an Alaska mattress they supply all the rest the most exacting workmen could demand.

They are noiseless under pressure, and because of their all-steel construction are not only durable and rigid, but entirely vermin proof.

Finished in black japan. Elevation of lower spring, 19 inches; of upper spring, 50 inches.

Shipping Weight, 118 lbs.

Alaska on an article means high-grade, every particle

Steel Carriages

Built with knee opening of 36", 50", 60", 72". Supplied in any length and with any number and spacing of head blocks. Designed for rope or steam feed.

450 WATEROUS CARRIAGES SOLD IN CANADA

Frame

The frame is built to eliminate spring. Stringers and cross girts of 8 in. x 6 in. selected oak, braced through-going tie rods and substantial corner brackets. Stringers are iron banded to prevent wear.

Running Gear

All steel. Double axles under each log seat. Bearing surfaces everywhere much larger than is the usual practice. Adjustment to take up wear provides means of quick re-alignment.

Head Blocks

Cast of toughest steel throughout. Log seats of double girder section with wide heavy nigger nose, braced internally and steel faced with reversible lining plates. Knees high and of new design, are steel faced, provided with nigger hook and spring cushioned, self aligning taper movement of 6 inches.

Racks and Pinions

Cut from the solid steel with deep involute tooth. Extra wide with the pinion split and adjusted to overcome back lash.

Dogs

These carriages are provided with Waterous Inserted Tooth Dog, latest and most common sense dog on the market. Damaged teeth can be withdrawn and replaced without disturbing the dog in the knee. Designed to swing to draw the log against the knee tightly and firmly. Small logs, large logs and cants of all sizes handled equally well.

Set Works

Our No. 4 Combination Set Works. A setter and receder in one machine. **Cannot develop lost motion.** We can prove this. New form of pawl. All operating parts of steel or wrought iron. The strongest, quickest acting, most exact set works yet produced.

The Complete Matcher

Our No. 77A—Model 5

A Supreme Achievement

This matchless machine embodies everything that makes for a thoroughly efficient and desirable Matcher and Planer. It is the last word in modern woodworking machinery in design and equipment. Its work is as perfect as it is possible for human achievement and present-day machinery to produce and its capacity is far greater than any other machine on the market.

Automatic Belt Release and Tighteners; built-in Head Knife Jointers for both top and bottom heads; a Feed Roll Gearing that eliminates all chains and sprockets; Matcher Logs quickly and easily adjusted; micrometer adjustment of Feed Rolls and Platen; these are a few of its desirable features.

Its capacity for an increased output in all patterns of siding, ceiling, flooring, etc., makes it an all round superior machine.

LOGGING CARS

Jno. J. Gartshore

58 Front St. West, Toronto

"One of the leading manufacturers of Southern pine (The Long-Bell Lumber Company) is advertising nationally for the purpose of getting the public to call for his branded lumber. The dealer who is selling the product of this company is certainly overlooking a large sized bet if he does not let his local public know that he has the material in stock. He has nothing to lose and much to gain by advertising himself as the local distributor of the lumber that they have been hearing about through the national advertising of the manufacturer."—From the Southern Lumberman.

Good lumber, plainly branded with the name of its manufacturer, its quality nationally advertised, distribution that has service for its watchword—these are some of the outstanding points that commend the products of The Long-Bell Lumber Company to the lumber trade.

Service Service

In times like this when lumber is scarce and hard to get, you will want a good connection. Try us. We have large blocks of CYPRESS in the south, besides we carry from one to two million feet of CYPRESS in our Cairo yard, from 1 to 4// thick, in all grades, and can ship out of this yard on a week's notice as we always have cars. We also have in transit to our Cairo yard, at all times, straight cars of any grade of CYPRESS and can divert same to you. Therefore, we are the people to furnish your lumber. Send us your enquiries and try us out. We are selling most of you now, but we want to sell you all. Write us for prices.

The Carriage You Are Looking For

Our No. 1 Size

CARRIAGE—Has three head blocks, as shown in cut, usually set 9 and 6 feet apart, will be placed any distance apart to suit purchaser. Knees open 38 in. from saw, and is fitted with Knight or Peel dogs, as desired. Taper movement on each knee. 1 15-16 in. steel set bar with steel pinions and coil spring receder, and friction lever brake for stopping knees where required. Timbers are 5 x 6 in., or heavier if desired, well bolted and braced. Diameter of truck wheel, 12 in. Axles 1 3/4 in. diameter, and extend clear across carriage, are furnished with self-oiling bearings. Front block is fitted with timber rule, placed as desired; 54 feet of V and flat track furnished with each carriage.

SET WORKS—As shown in cut, is made up of ratchet wheel 12 in. diameter, 4 in. face, with set lever carrying 7 steel pawls of varying lengths; also, same number of check pawls set in quadrant. Both sets of pawls are disengaged from either side of carriage when required to recede knees. This is a positive set, without lost motion.

FEED WORKS—As shown in cut, consists of 16 x 12 in. drum, with spur gear keyed to shaft. Pinion or friction shaft in saw frame engages with this gear. Cable takes two or three turns around drum, and is passed around end sheaves and attached to carriage. We also furnish 26 in. drum with internal gear in place of 16 in. drum when desired.

SIMONDS

INSERTED TOOTH

The perfect fit of the Points and Shanks in the Plate means no disturbing of the tension of the plate when inserting or removing points.

SAW

Milled grooves in Simonds Points and Shanks and milled "Vs" on the plate insure absolutely rigid teeth and perfect alignment.

Simonds gives perfect results on the toughest kind of sawing. Write us about the cutting you have to do.

Feeding the Camp

IF that is your problem, remember that it is our business, too. We do a tremendous lumber camp trade and are fully acquainted with the food requirements of logging camps. We shall be glad to quote you on any lines you need this year, and will submit special quotations if you will drop us a card. We can supply you with all that's best in provisions and fresh meats, and give you a service you will appreciate.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice, at Buffalo, N. Y., under the Act of Congress of March 3rd, 1879.

No. 21

The Lumberman and His Problems

In the ups and downs of business it is not an unusual experience for one who has enjoyed a moderate measure of prosperity or even scored a decided success in a financial way, to sit back occasionally and ruminate whether he might not have done better had he entered, at the outset of his career, some other sphere of activity. After an insight of twenty-five or thirty years one is inclined to review the past with considerable interest and raise an interrogation to the effect that, had he his life to live over again, would he follow the same course.

It is a peculiar characteristic of human nature that it never seems exactly satisfied. We are all prone to observe the snags and pitfalls which beset our own road, but the route of the other fellow resembles a primrose path leading down a pleasant vale to the borderland of happiness and content. We see too much of our own difficulties and obstacles, but have not the same broad vision or perspective regarding the perplexities of the other fellow. This may be accounted for quite easily when we remember that those on the outside seldom see what is going on in the inside, and in respect to our own particular vocation we are all on the inside and know comparatively little of what is transpiring on the outside. Lack of intimate acquaintance and daily association makes us think that the other fellow always has the best proposition, that his customers are more easily satisfied, that his manufacturing and selling conditions are more pleasant and agreeable and generally the whole of his organization conducted with less worry and disappointment, less labor and other deterrents than our own.

Reverting to the lumber business, too often the contractor wishes he were a retail lumberman and the retail lumberman believes that had he started into the wholesale business he would have ere this earned a sufficient reward, as the result of his foresight and devotion to duty, to enable him to live in comparative luxury for the

rest of his natural days. The wholesaler thinks that had he gone into the manufacturing line and dealt with the conversion of the raw material into the finished product, instead of acting as a large distributor, he would have cleaned up and, to use a colloquial expression, been on "Easy Street" by this time. The manufacturer will tell of his troubles with labor, production, raw materials and delivery, and wish that he were rid of them all and had simply to buy the stock and turn it over; then he would be comparatively happy.

Thus the flame of human interest and desire plays upon many scenes. Each one of which looks more alluring than the other, but when the other is reached then there seems to be a spot just beyond where all worries cease and satisfaction prevails. It all makes an interesting commentary upon the aims and desires, the pursuits and the pleasures, the ambitions and disappointments of the average man and few seem thoroughly content with their lot. Now and then one will admit that he has selected the right course and will be frank enough to acknowledge that the business he is in is not bad, yet adds a proviso that he would like to be in some other end of it; and so the ripples on the stream are seen on every hand. It is well summed up in the viewpoint of a leading lumberman who is recognized as one of the shrewdest and most successful of sawmill operators in the Dominion, yet the other day he declared seriously that he wished he had gone into the wholesale end of the business. He added: "The lot of the sawmill men is the most uncertain of any. There are so many 'ifs' about it. If we can get the men we can cut the logs; if we get the snow, we can haul them to the stream; if we get the rain we can float them to the mills; if we get them to the mills there is the question of labor; if labor is available, there is another 'if' in the way of the transportation, etc. Thus the whole circuit is one of 'ifs'. We send our men to the woods in August or September and the lumber made from the timber then cut is not sold or distributed until practically a year after. Thus we have to finance twelve months ahead or behind, which ever you like to call it. Now, with the wholesaler, matters are entirely different. He can go out and buy a block of stock, pay for it and sell the whole thing within a week or a month, collect his money and make a nice clean-up without any of the overhead worries that we have to go through for several months. If a fire should visit his lumber, why it is no doubt well insured, and he has not to wrestle with the labor problem, the weather, cutting, hauling, driving, sorting and manufacturing. The wholesaler should be a happy man to-day during this period of unrest, agitation and strife."

The Future of the Wooden House

The cabled reports from London give confused accounts of the wooden house situation. One clear fact, however, emerges from these reports—that a vigorous agitation has been waged in favor of wooden houses being erected to meet the very acute housing problem. The Ministry of Health was at first hostile, as the result of investigations into the suitability of the houses for Great Britain, and also on the assumption that the cost would be nearly as large as for brick dwellings. But the pressure of public opinion was too strong, and the department issued a series of regulations governing the construction of wooden houses. These involved considerable expenditure, due to elaborations deemed necessary to conform with British conditions. For instance, the lumber required by the regulations was larger in amount than in a typical Canadian wooden house. The result was strong criticism of the regulations, as being calculated to deter the building of the houses. The regulations did not survive the criticism; they were withdrawn, and the responsibility for the houses thrown upon the various municipal authorities, it being stipulated that the materials must be sufficiently strong to stand the inclement weather.

The wooden houses have found a backer in Sir Charles Ruthen, a member of the Council of the Society of Architects. He pointed out the pressing need for houses, and stated that if the output of bricks increased two hundred and fifty per cent. it would be some fifteen or twenty years before the present shortage would be overtaken. At the present time seven million people were improperly

housed. The facts, he stated, showed the impossibility of production of brick houses and the crying need of the immediate use of wood in building.

He estimated that if the housing problem is to be handled in any degree satisfactorily during the next five years a grand total of 1,044,000 houses must be erected or well over 200,000 each year. Calculating twenty-five thousand bricks to each house this would mean that five thousand million bricks would be required each year. To secure this amount two and a half times the number of workmen engaged in this industry before the war must be found to meet the demand.

The British Columbia representatives in London are hotfoot after the business for supplying wooden houses, and it is stated in a cable that some orders have already been given out. Three sample houses of different types have been sent from B. C. to London, and there is a probability of very extensive contracts resulting. Eastern Canadian firms have also gone after the trade very strenuously, the Canadian Timber Products Association, in conjunction with the Export Association Co. of Canada, having taken up the matter with the Ministry of Health. There are now several sample houses in France, where there is said to be a demand for these buildings, while Belgium is also in the market for some thousands of houses.

There would thus appear to be a very promising field for Canadian enterprise, provided always that sufficient shipping facilities and fair shipping rates can be obtained. The steamship companies are now charging very high rates, and these make it very difficult to compete with Scandinavian countries, where the freights are considerably lower.

The Many Recompenses of Courtesy

Courtesy costs nothing, yet is a valuable asset in all sections of business and social life. This is a truism which is not always recognized in a practical form. There is no class of men who appreciate courtesy more than the travellers of business houses. They are away from home, often for weeks together, in all seasons; have to encounter all classes and preserve a tactful and cheerful manner under all conditions.

"From a considerable experience on the road," remarked the head of a wholesale lumber firm, "I have a strong appreciation of the difficulties of travellers. Travellers are entitled to every courtesy from firms, and personally I am a believer in giving every representative at least a brief interview. Regarded even from the selfish point, such interviews are of value to those who are buyers of lumber. Travellers know general conditions in the lumber business far better than a man who sits in the office, and are able to give one much information of value, as they necessarily cover a very wide area. Naturally a busy man does not want his time taken up in the discussion of irrelevant topics, but any traveller worth his salt soon realizes the situation and does not waste time.

"In the lumber trade, at any rate, a refusal to see a traveller may mean the loss of stock worth while buying. To draw on my own experience, I always, in my younger days, used to call on one man—not because he bought from me, but because of the encouragement I received from the few words I had with him. I came away, perhaps at the end of a disappointing day, with a fresh stock of energy. He was, in a word, courteous. We sometimes hear of men who, although rough in speech and of a sour disposition, have yet kindly natures; but as a rule we avoid these prickly thorns. We are naturally attracted to men with courteous dispositions, and travellers are quick to size up a man's characteristics."

Editorial Short Lengths

In the Abitibi, P.Q., region there are now fifty sawmills completed and another four are in course of construction. At La Reine 6 mills are completed; Dupuy, 3; La Sarre, 6; Macanic, 6; Aulhier, 2; Privat, 4; Launay, 1; Trecesson, 2; Dalquier, 1; Figuery, 1; La Motte, 1; Amos, 5; Landrienne, 2; Barraute, 2; Courville, 1; Senneterre, 2; Doucet, 2. It is estimated that during next season 60,000,000 feet of lumber will be produced in this region. The Québec Government has spent large sums in developing the district.

Although comparatively little lumber has been sent to the United Kingdom on liners this season, a fair quantity has gone on tramps. The steamship lines have had such large quantities of ordinary cargo offered, that they have been able to ask very high rates, with the result that lumber could not be shipped except on a speculative basis. Room, too, is restricted, and the steamship lines are not anxious for lumber. The Government Timber Buyer is rushing all the lumber that can be sent, and the port of Montreal is loaded up with cars awaiting to be placed on board. The Liverpool strike interfered somewhat with shipments, but it is hoped to have the great bulk of the lumber shipped by the end of this month.

The Commissioner inquiring into the high cost of living has addressed a questionnaire to all manufacturers of lumber in Canada. The lumbermen are asked to give information about cost of production, and the reason for the price advances since 1914. A statement issued by the Cost of Living Commissioner is to the following effect: "Since the housing problem is one of the most serious in the country at present, lumber is one of the necessities which come within the scope of this investigation. The present high price of building materials is having a deterrent effect on building operations. There is a tendency to consider these prices abnormal and temporary. This inquiry aims to find out what increase has taken place.

In regard to logging operations during the coming season it is rather difficult to gauge conditions accurately at the present juncture. There will be a much larger cut in many centres, particularly in the Ottawa Valley and Northern Ontario, but advices regarding the availability of help differ widely. At some points bush workers are reported as numerous and the camps well filled up, while in others there is a shortage of man power. A large number of foreigners, now that the war is over, have returned home laden with cash-filled wallets by reason of the high wages received, and this effluxion has materially lessened the number of lumberjacks in various districts. It is generally conceded that labor is not as efficient as it was before the war, and that it now requires three men to accomplish what was formerly carried out by two. In the production of timber during 1920 labor will play an important factor, and just how it will shape up eventually cannot be stated as yet. It is too early to read conditions aright or make any predictions, but a number of operators are hoping that, with the closing of a large number of sawmills at the end of the present month, there will be an improvement in those parts of the country which now complain of a dearth of help.

The following statement given out in a recent interview with Mr. Wharton Clay, Commissioner of the Associated Metal Lath Manufacturers of Chicago, covers very fully the present building situation:

Those who are holding off from building at the present time will be sadly left. The general public already understand that prices on building materials are not going to be any lower. The Trade Associations now have the problem of convincing the public that the number of mechanics available in the United States for building construction is far below the normal requirements. This is due to many reasons, chief of which are the natural death rate in the past few years, with practically no addition of apprentices to fill up the depleted ranks. This was particularly intensified by the influenza epidemic of last year. The death rate among building mechanics was very high, due to the exposed conditions under which they are required to work.

Further, thousands have left the building trade and gone into other occupations which have offered them steady employment, and hundreds will never return.

It is entirely possible that the great building boom will bring a shortage of material, and the difficulty of transportation will be greatly magnified, and on the whole, conditions are better for the economical construction of building at the present time than they are likely to be for many years to come.

Lumber Stocks In West Are Greatly Reduced

Major-General McRae Tells Wholesale Lumbermen That Costs Are Mounting Rapidly, But Good Market Is Assured For The Next Two Years

Major-General A. D. McRae,
Vancouver, B.C.

which addresses were delivered by Major-General A. D. McRae of Vancouver, B. C., Mr. A. C. Manbert of Toronto, and Mr. John Pearson, who spoke on behalf of the Navy League of Canada.

Major-General A. D. McRae was a guest at the meeting having been in Toronto on a business visit. Lumbermen in all parts of Canada are intimately acquainted with General McRae's splendid record, both as the head of the Canadian Western Lumber Company, B. C., and as one of the most important Canadian officers who went overseas during the war. General McRae's wide business and organizing experience led to his services being utilized in connection with some of the most important purchasing and organization work of the Canadian forces, and finally he occupied a leading position in connection with the British Department of Propaganda.

After referring to a few matters relating to the war, General McRae described conditions in B. C. as they are to-day, chiefly in connection with lumber industry. He stated that the lumber manufacturing business on the coast presented many startling contrasts from that of five years ago. Practically the whole of the trouble facing them to-day was the outcome of labor conditions. While the general situation on its face appeared excellent, it was evident to the close observer that they were going to have considerable difficulty during the approaching winter. In preceding winters they always counted upon a good deal of unemployment at the coast. This year they were going to have a great deal more. Under the demobilization scheme of the Canadian forces, the boys were given the opportunity of taking their discharges wherever they liked in Canada, and many of them had decided in favor of going to the west coast. The unemployment situation on this account would be greatly aggravated and would become acute during winter.

Western Log Supply is Limited

The labor situation was the regulating factor in connection with the production of lumber, as the latter depended entirely upon the supply of logs. They could, therefore, anticipate a rather long shut-down of all the Pacific Coast mills during the winter as the log supply would be very limited.

Speaking of the situation in the woods, General McRae again laid emphasis upon the influence of the labor situation in British Columbia to-day. They had an eight-hour day for labor. The efficiency of woods labor had fallen off from 30 to 33 per cent, so that they were only getting about 50 per cent. of their former output. On a logging chance which used to cost from \$3.35 to \$4.00 per thousand, to put in the logs, the cost to-day was \$14. Wages were from \$4.50 to \$12 per day, and when he left the coast the men had been on strike for a \$5.00 minimum, with the eight-hour day lasting from the time when the man started from the camp until they arrived back. Many other demands were made, some of which were not only impossible, but utterly fantastic. They simply meant that the men wanted in

future to be boss. He understood that some sort of a settlement had now been reached, giving the men certain concessions.

It was quite impossible to satisfy labor at the coast to-day. Organization in the woods was under the O. B. U., and that meant I. W. W., whose doctrine it was to break the employer. They advocated that the men should lie down on the job. General McRae urged the manufacturers of Eastern Canada, if they were faced with organized labor in the woods or mills, to get it under the American Confederation of Labor or some other responsible body which would live up to its agreements.

Should Eject All Strike Leaders

The strike in B. C. had actually been brought about by a small minority of the employees. Quite 80 per cent. of their men had been all right. Probably not over 10 per cent. of them wanted to strike, while 80 per cent. wanted to stay. In most camps it had been 2, 3, or 4 men who had drawn out all the rest. Investigation showed that these strike leaders were men who had been driven out of Spokane, Seattle and other United States Pacific coast cities. If the Canadian Government would only take these men by the back of the neck and put them out of the country much of the labor trouble in Canada would be eliminated.

Discussing the situation in the Pacific Coast mills, General McRae said that conditions were improving, but the output was regulated almost entirely by the supply of logs they could get in the water. The cost of logs had gone up rapidly, and the result was that they were "up in the air". How long they would stay up nobody could say. Of course it was going to come down some time. But purchasers were afraid lest they should be caught in the avalanche.

Between 75 and 85 per cent. of the B. C. Coast lumber business to-day was with the United States. But a good many of the Coast mills, appreciating the fact that their bread and butter business was at home, had endeavored to take care of the home trade, as well as they could.

General McRae referred also to the situation in connection with available lumber stocks. When he went overseas, about the beginning of the war, they had about 100,000,000 feet on sticks. To-day they had about 28,000,000 to 29,000,000 feet, so that it appeared certain that stocks were going to be very low for some time. The building programme in the Western States was going to be larger next year than this year, so that he thought the market for British Columbia lumber was well assured for perhaps another couple of years in the United States. At the same time the output in British Columbia was going to be very limited. That was the situation as it appeared to him.

Mr. Manbert Reviews Conditions Overseas

Mr. A. C. Manbert, of the Canadian General Lumber Co., Toronto, who recently returned from Great Britain, where he had conducted propaganda work on behalf of Ontario lumber manufacturers, also addressed the meeting, giving a very interesting description of some of the conditions, both social and industrial, which he found in England during his six months' stay. Much that Mr. Manbert had to say has already been reported in the "Canada Lumberman," both in his correspondence from abroad and in personal reports upon his return.

Mr. John Pearson, representing the Navy League of Canada, also addressed the meeting to urge the Wholesale Lumber Dealers to take an active part in the forthcoming Navy League campaign to raise funds for its various activities in Canada. At the close of his address, on the chairman's suggestion, practically every member promised that his firm would furnish, at least, one man to help in making up the Wholesale Lumber Dealers' team to take part in the campaign on October 21st, 22nd, and 23rd.

A few further remarks were made by the chairman, and by Mr. Manbert, regarding the activities of the association during the coming months. The meeting then adjourned.

A federal charter has been granted to the Edmonton Lumber Exchange with a capital stock of \$200,000 and headquarters in Edmonton. The new organization is empowered to carry on in all its branches a lumber, timber and pulpwood business and to manufacture, sell and deal in timber, logs, lumber and wood of all kinds, pulp, paper, etc., and to acquire timber limits, water lots, etc. Among the incorporators are J. W. S. Chappelle, W. F. Cavanagh, J. J. Nierengarten and Benjamin Shore, all of Edmonton.

Educating England To Use Wooden Houses

Canadian Mission in London is Conducting Live Propaganda Campaign and Seeking to Dispel Many False Misconceptions Prevailing in Old Land

"The housing situation in England is, as you know, serious, and requires prompt and expeditious attention, and one of the difficulties is material," says a representative of the Canadian Mission in London in a letter to the "Canada Lumberman."

"We have been doing everything in this office to advance the cause of the lumber-built house, because we know, if we can overcome the official prejudice and the general feeling here that the lumber-built house is a temporary domicile, that Canada and Canadian lumber can take care of itself once the public are sufficiently educated in this country to accept the idea that a well-built, properly planned house of lumber is a suitable place of abode in this country."

"We have been endeavoring to get pictures of Canadian houses in the press, and have partially succeeded, but owing to the great strike and trouble through which this country is now passing, and the cutting down of newspapers it is almost impossible to get space at the present time, but as soon as the situation is relieved we will continue the propaganda."

The following articles have been sent out from the Canadian Mission, London, the first one going to the Canadian press and the second one to the British press. They are well worth perusing:

Canadian Timber for British Houses

During the last few weeks there has been a great controversy in the British press as to the prompt solution of the housing question in England. Much has been written relative to the wooden house. The general idea seems to be that it must be something of the up-ended packing case or rabbit hutch, and many ridiculous reasons are assigned as to why a house built of wood is not suitable for the United Kingdom.

Some say that, owing to the climate, people could not live in them. Canadians will smile at this when they think of the comparative mildness of the British climate to some winters they have passed comfortably in their wooden homes of Canada.

Another statement is made that a house built of wood will not last, yet there are many contradictions of this fallacy in houses built of wood in England that were in existence before Queen Elizabeth's time. Some say that a wooden house is hard to paint. Others contend that they have wooden houses in Canada because there is no brick or stone to build others.

The sum total of the situation is that the people of Great Britain have got to be educated to the fact that a properly and economically planned and well built house of wood, either plastered or finished in panel, is a warm, durable, economical and comfortable place to live in. To this end the people of Canada, and particularly the women of Canada, can do a great service to the lumber industry by making it their personal duty to write to any friends they may have in England, explaining to them the advantages and comfort of a wooden house. Personal letters of this kind will have a most beneficial effect upon the situation.

Although the shortage of houses and the housing question is a very acute one here, yet in the city of London alone at the present time there are over 60,000 substantially built stone and brick houses empty and to let. In the year 1903, which was considered a slack time, there were only 15,791.

The reason of this extraordinary state of affairs is, that, owing to the obsolete, inconvenient and unworkable plans of these houses, it is almost impossible for people to get domestic servants to go in to them, where such things as water and coal have to be carried up many flights of stairs, etc.

One of the difficulties of the situation will be to induce the architects of this country to adopt new ideas and new systems. Although the great inventor, Edison, has said that in the last five years, owing to the exigencies of the war, civilization has advanced 250 years, yet it will be exceedingly difficult to overcome prejudices of architects and contractors in this country, and the only way to do it will be by demonstrating to the private individual in the way that has been already outlined by a method of correspondence, pictures, etc., to personal friends in this country.

Quickest Solution of the Housing Problem

To-day there are over 60,000 houses in London empty. In the year 1903 there were 15,791, yet we are told on every hand the shortage in housing accommodation is acute. What is the reason of this?

The reason for this can only be attributed to the obsolete, inconvenient and economically unworkable plan and construction of the present London house.

On the basic principle of the present great reconstruction in the world that "old things have passed away and all things have become new" we must look for a more speedy and practical solution of the present difficulty than by continuing to build the rows of uninteresting, badly arranged brick houses that one sees in most of our large cities. The prompt solution of the trouble is houses built of wood. Judging from the press, the general impression seems to be that a house of this nature is a sort of rabbit hutch or up-turned packing case or army hut. Anyone who has visited Canada and seen the well planned, economically worked, comfortable and cheerful residences of the people constructed of wood will at once appreciate the absurdity and fallacy of these ideas. Some have gone so far as to say that owing to climatic reasons houses built of wood are not suitable for this country. A properly constructed wooden house plastered in the ordinary way on the inside is just as warm and comfortable as any more solid structure of stone or brick, and the rigours of the winter climate in many parts of Canada have no terrors for the people on the score of comfortable homes.

A steam-heated Canadian house, with an open fireplace, where, for cheerful reasons, wood or coal fires can be burned, are far more comfortable than the average English house with the small, smoky coal grate, where one can roast one's front whilst one's back is shivering in the Arctic regions of the atmosphere of the room.

In building groups of wooden houses central heating can easily be established and an enormous economy in coal could be effected.

One amusing reason assigned by a prominent person was as follows: Oh, yes, they certainly have to build houses of wood in Canada as they have no brick or stone. This, to the average Canadian, is more than amusing. Another reason assigned is that a house built of wood is difficult to paint. It is unnecessary to say this difficulty can easily be got over. The question of durability of a wooden house has also been brought up, but looking around England one can see wooden structures dating from the time of Elizabeth and further back the evidence is before those who wish to prove the durability of this class of structure. A properly constructed, well taken care of house, built of wood, will last at any rate one hundred years, and will always be a far more cheerful and comfortable home and less expensive than the present method of building in this country.

For artistic effect, economy and comfort, those who have experienced living in well constructed Canadian houses, built of wood, can readily testify to their suitability for the British Isles. The Eastern Canadian hardwoods are well fitted for flooring and panelling, and the far-famed Douglas fir and cedar of British Columbia cannot be excelled for the outside work, also supplying the durable, light, and serviceable cedar shingles for the roofs. Those who have seen the beautifully finished and grained panelling of the Douglas fir and cedar for interior decorations all testify to its suitability for inside lining, finishing and decorative purposes.

What Canada Could Supply Abroad

In regard to the prospect of the Canadian Timber Products Association supplying the Old Country with portable or ready-made houses, A. G. Rose, of Ottawa, who spent several months abroad last winter, investigating requirements and conditions, in the interest of the Canadian Timber Products Association, writes the "Canada Lumberman" as follows:—

"I do not think that the wooden house proposition will be acceptable in Great Britain; at least, from my experience of three months' work over there, this is the conclusion I arrived at. In fact, the British Government refused to allow the erection of wooden houses in the country. I understand the Canadian Mission in London recently have asked for films showing examples of Canadian frame houses for advertising purposes. The house they want would have to be in the British style of architecture, and, of course, this is entirely different to the house we concluded to build for France, but this is a matter that the Canadian Timber Products Association would have to look into. The freight rates now are very high, and we do not see how we could ship ready-cut houses to England at the present rates. I feel that the factory men at the present time are crowded and are not in a position to take up the available export business."

New Timber Cutting Regulations in Quebec

Deputation Urges Upon the Government Necessity of Several Changes in Lumbering Operations—Reforestation of Lands Held Under Licenses

A deputation of the Woodlands Section of the Canadian Pulp & Paper Association and of the province of Quebec Limit Holders' Association on October 15th at Quebec interviewed the Hon. H. Mercier, the Minister of Lands and Forests, on the subject of the cutting of timber on crown lands. This was following up the resolution passed at the summer meeting of the Woodlands Section of the first named association—"That in the opinion of this meeting certain changes in the regulations of lands and forests governing the cutting of timber on crown lands are essential to the preservation and perpetuation of the forests, and it is respectfully requested that the Executive Committee of the Canadian Pulp and Paper Association appoint a committee to co-operate with the existing committee of the province of Quebec Limit Holders' Association in waiting upon the Government with a view to urging the necessity of an early revision of these regulations in order to meet present day conditions."

On the previous day a conference between members of the committee of the section and the Limit Holders' Association was held at which, in an informal way, the proposed changes were discussed. The following were present: Messrs. Ellwood Wilson, Laurantide Co., Ltd., (chairman); R. P. Kernan, Donnacona Paper Co.; W. Gerard Power, River Ouelle Pulp & Lumber Co., (pres. of the Canadian Lumbermen's Association); Brig.-Gen. J. B. White, Riordon Pulp & Paper Co., Ltd.; J. M. Dalton, St. Maurice Paper Co.; T. F. Kenny, Jas. MacLaren Co.; M. H. Montgomery, Montgomery & Sons, Ltd.; William Russell, Jas. Richardson Co., A. L. Dawe, secretary of the Canadian Pulp and Paper Association, and Paul G. Owen, secretary of the Limit Holders' Association.

The Future Supply of Lumber

The members, in discussing the various points of the proposed changes, insisted upon the necessity of a change in the regulations so as to insure a good supply of lumber in the future. The question of waste was also touched on, it being urged that it was imperative to take steps to prevent this. The co-operation of the Government and the licensees was necessary to this end.

The subject of hardwoods was also brought up, particularly in relation to their utilization and logging. Some experiments are being conducted, which it was said gave promise of very satisfactory results. It was also pointed out that hardwoods had been used successfully for pulpwood purposes in some mills.

In connection with the general subject the following recommendations were submitted by Mr. Wilson:—All stumps should be cut not over one foot in height. All material down to three and one-half inches at the small end should be cut from the tops, where it is necessary to accomplish this, pieces down to four feet in length should be taken. All branches burnt and blown down and those attacked by insects or fungi, should be taken. All roads should be made with hardwoods. So far as possible all camps should be made of hardwood. All logging debris should be burnt to prevent the spread of disease, to eliminate the fire hazard, and to improve conditions for reproduction. Wherever hardwood is accessible to the mills it should be utilized. In the sulphate and soda processes this is now done, and while it cannot be utilized with the sulphite process, up to fifteen per cent. of hardwood ground wood pulp can be used in making newsprint. It takes less power to grind, the yield is about 25 per cent. more than for spruce and balsam and the quality of pulp is good. It does not bark easily in the knife barkers but does bark without difficulty in the tumbling barrels, and less of it needs rebarking than with spruce and balsam. In regard to driving, hardwood, cut and barked in the fall, is said to drive better than softwood. Cut in the spring and left with the branches on till fall, the hardwood logs float the whole season without difficulty. Mills which do not use balsam fir should do so, as there is no objection to its use whatever.

The Hon. H. Mercier gave the deputation a very cordial reception. The case for the deputation was presented by Mr. W. Gerard Power, who submitted the following draft for a Bill, embodying the changes desired. These changes were the result of the discussion at the conference held the previous day.

Par. 7.—Reforestation of the Lands Held Under Licenses to Cut Timber

1669a. When, on public lands held under license to cut timber, there are areas of more than one hundred acres

deprived of coniferous timber, if the person or company holding such license wishes to plant forest trees thereon, they may apply to the Minister and ask for a special license for this purpose.

The Minister shall obtain from the applicant, or, if the applicant be a company or corporation, from its president, manager, secretary, treasurer or officer duly authorized an affidavit stating: 1, that such area of land is deprived of coniferous timber and advantageous for reforestation; 2, that the applicant is in good faith and really intends planting the land applied for.

If the Minister is satisfied with the truth and sufficiency of the facts set forth in the affidavit, he may, under his hand and seal, issue to such applicant a special license, containing a description of the land and allowing its occupation for planting purposes.

1669b. Planting of such area shall be made within four years of the issuing of the license, and it shall be performed in accordance with the requirements of the present law as well as with the conditions of the license.

Not less than twelve hundred trees per acre shall be planted, except where the nature of the soil, mountains, rocks, rivers and other natural obstacles render such planting impossible.

If the land is already timbered with other than coniferous trees, sufficient of these must be removed to ensure the growth of the planted trees, and in such removal the Government cutting regulations shall not apply and no stumpage dues shall be collected.

1669c. Holders of licenses under the present law shall have such licenses registered in the register kept by the Crown lands' agent, in accordance with the terms of article 563.

1669d. If the planting license contains any clerical error, misnomer or misdescription of the land, the Minister may annul such license and order a new and corrected one to be issued, which shall take effect from the date of the first one.

1669e. The planting license may be transferred, and then shall be subject to the rules and restrictions contained in article 1562, 1563, 1564, 1568 and 1569, mutatis mutandis.

1669f. Four years after the planting, if the conditions of the license have been fulfilled and if the planted trees are in growing condition, the Lieutenant-Governor, on payment of the sum of \$1.00 per square mile or portion thereof shall vest the lessee with the absolute property of the land occupied under said license for 99 years, subject to a renewal of the lease for a further like period, and one-half the cost of said planting shall be refunded to the lessee by the Government on production of proper vouchers.

1669g. All land occupied or patented under the present law shall be free from all provincial, municipal and school taxes of any kind, during the existence of the planting license.

1669h. The cost of fire protection on the territory planted as above shall be divided between the Government and the lessee.

1669i. When the trees so planted shall have reached sufficient size to warrant thinning, such thinning shall be made at the cost of the lessee and he shall pay to the Government a stumpage tax not to exceed one dollar and a half per cord or 128 cubic feet stacked.

1669j. At any time after the trees as planted above shall have reached a diameter of six inches at four and one-half feet from the ground the lessee may cut any or all of said trees, and shall pay to the Government a stumpage tax not to exceed one dollar and a half per cord of 128 cubic feet stacked.

One point brought out was that the limit holders had no intention to encroach on the rights of the settlers, but that it was desired to co-operate so that the natural resources of the province could be developed.

Lumbermen Are Active in Fire Protection

New Brunswick Speaks Appreciatively of Their Assistance During the Past Season

—Province Had 342 Fires With Total Damage of \$154,000—The Causes

G. H. Prince, provincial forester of New Brunswick, has issued an interesting report giving a summary of the forest fires in that province during the season of 1919. The total number from April to September (both months inclusive) was 342, of which 240 were caused by the railways, and 102 from other causes, as follows: Fishermen, campers, travellers, hunters and smokers, 25; settlers, neglecting clearing fires, 38; industrial operations and careless use of fire, 13; accidental, 4; incendiary, 7; unknown, 15.

The total area burned was 11,326 acres, or about 17¾ square miles, and the total damage done was \$154,155.

The damage resulting from the fires through each cause was:

Railroads	\$5,400.00	or 3.5%	of total damage
Fishermen, campers, travellers, smokers, etc.	48,870.00	or 31.7%	"
Settlers	67,985.00	or 44.1	"
Industrial	11,000.00	or 7.1	"
Accidental	1,100.00	or .7	"
Incendiary	12,700.00	or 8.2	"
Unknown	7,100.00	or 4.7	"

Totals \$154,155.00 or 100%

The number of fires occurring each month was:

	Railway Fires	Other Fires	Total
April	2	2	4
May	26	40	66
June	129	45	174
July	54	11	65
August	28	4	32
September	1	—	1
Totals	240	102	342

The total number of locomotive inspections made was 275; of these 202 were found satisfactory and 73 had defective appliances. In the 75 locomotives with defective appliances these were found to have 88 defects in the front ends and 40 defects in the ashpan.

Co-operation of the Lumbermen

Great credit is due the lumbermen and lumber companies throughout the province for their earnest co-operation in forest fire protection. About 60 of their chief woodsmen were appointed co-operative fire wardens during the dry season of the year. They assisted materially in keeping down the fire danger. It is to be hoped that this will be carried on and extended next year.

Through an agreement with the Public Works Department of the Province about 500 road supervisors co-operated with the Forest Service in reporting and putting out forest fires in the vicinity of their work. These arrangements worked very well and did much to keep down the numerous small fires occurring along our highways. Thanks to Hon. P. J. Venoit, the Minister of Public Works, for his interest and co-operation in this work.

There were 36 prosecutions for violation of the Forest Fire Act of New Brunswick. These were principally for burning slash without a fire permit or neglecting to attend to clearing fires. Twenty-nine convictions were obtained, two cases were withdrawn and five cases dismissed.

Settlers Careless in Clearing Land

With the exception of about six weeks of extra dry weather during May and June, the past fire season was an average one as regards weather conditions in New Brunswick.

The most disastrous fire of the year was caused by carelessness of settlers clearing land and not taking the proper precautions against their clearing fire spreading. At Kedgwick, in Restigouche County, on June 12th and 13th, several of these fires got beyond control and caused enormous damage, especially to lumber and property. In this county alone there were 22 fires burning over 8,180 acres or about 13 square miles, and doing about \$126,000 damage, most of which was to ties, logs, saw-mills and settlers' houses.

During the past season the Provincial Forest Service, through the co-operation of the Canadian Forestry Association, has carried on a rather extensive campaign to educate the public on the importance of better forest fire protection in New Brunswick.

This was done principally by the distribution of posters, circu-

lars, and through newspapers, motion pictures houses, schools, Boy Scouts, exhibitions and exhibition car.

About 10,000 instructive and attractive fire posters in French and English were distributed by the Forest Rangers throughout the Province.

Educating the Public on Fire Prevention

About 3,000 circulars on fire protection and slash burning were distributed to the citizens of New Brunswick, as well as 500 circulars on "How to Burn Your Slash" were distributed to the settlers by the rangers.

The newspapers were used extensively and to good advantage in advertising the importance of the work the Forest Service was doing in New Brunswick, and in advertising prosecutions and violations of the Forest Fire Act.

Several good reels of moving pictures on Fire Protection have been shown, and through the co-operation of the owners of moving picture houses numerous instructive and warning slides have been shown during the dry season of the year. Two lectures with motion pictures were given by Mr. Robson Black at the Provincial Normal School, which should have good results in educating our coming school teachers on this big subject.

An interesting letter for the school teachers and school children, with 12,000 booklets "About Camp Fires" was distributed and read throughout the schools of the Province on June 4th. Interesting literature on fire protection was sent to the camp meetings of the Boy Scouts and two of our rangers attended their meeting and gave the boys talks on fire protection and "How to Make a Camp Fire," etc.

An interesting fire protection and pulp exhibit was displayed at the Fredericton and Chatham exhibitions.

The fire protection display was represented in four scenes—one scene the year of the fire, another, two years after the fire, another, five or ten years after the fire, and another, twenty years after the fire. Each of these scenes represented the conditions as they actually were in the forest. In the twenty-year growth were two small live deer, which added much to the attractiveness of the booth. Numerous moose, deer and bear heads, with mounted wildcat, beaver and owls formed a good background.

Through the co-operation and assistance of Mr. Stokes of the Forest Products Laboratory, Montreal, a good pulp exhibit was displayed. The whole was surrounded with white birch railing, which added much to the rustic effect of the booth. The booth, as a whole, attracted a great deal of attention and met with approval and commendation on all sides. Here the members of the Forest Service met many people who were interested in forest fire protection and distributed considerable good literature.

Will Wooden Houses Solve the Problem?

A controversy on the subject of wooden houses has been raging for some time in the British press, and its outcome will be awaited with much interest by Canadians. Wooden houses on the American plan have been suggested as a means of solving the acute housing problem, and if adopted under the Government housing scheme will probably lead to a very large trade in portable houses from Canada.

F. C. Wade, agent-general for British Columbia, has offered to have 500 wooden houses delivered in Britain so as to be available for occupation by Christmas. He states that such structures can be imported and erected at a cost of fifteen hundred dollars and upwards. The British Ministry of Health, however, is not yet convinced of the superior merits of wood as opposed to brick or stone, doubt being held as to whether it would stand the damp island climate of more than fifty years. The opinion has also been expressed that the necessity of frequent repainting makes the wooden house expensive. A third objection is the shipping shortage on the Atlantic, and a fourth is the expected hostilities of labor unions to the importation of such finished material.

There are few wooden houses in Britain, the reason being the by-laws against their erection. The Ministry of Health is now drawing new regulations to permit the building of such structures. There are other signs that public opinion is veering round in the direction of wood, and further education as to its advantages will be of great benefit to the Canadian timber trade.

His Royal Highness Pays Visit to Leading Coast Sawmill

The royal party returning from the mill. In the front row, reading from left to right are: Mayor Gale (in silk hat), Major-General Sir Henry Burstall, Alderman Woodside, Rear-Admiral Sir Lionel Halsey, Mr. J. Alex. Hendry, the Prince, Mr. Hamber, Mr. Arthur Hendry Sir Godfrey Thomas, Alderman Owen

ON September 23 the British Columbia Mills Timber & Trading Company was honored by a visit from His Royal Highness the Prince of Wales to the Hastings Saw Mill. The large plant presented a gay appearance; an arch of forest greenery and maple leaves with the words "Welcome to the Hastings Saw Mill" was placed over the entrance; and other parts of the plant were profusely decorated with evergreen trees, flags, bunting and appropriate emblems, which received added effect from the serenely beautiful weather.

His Royal Highness, who was accompanied by Rear-Admiral Sir Lionel Halsey and Major-General Sir Henry Burstall, arrived about 11 o'clock. He was received by Mr. Eric W. Hamber, the president, Mr. Arthur J. Hendry, general superintendent, and Mr. J. Alex. Hendry, secretary. With the party were the Hon. Martin Burrell, His Worship Mayor Gale, the alderman, and many others. Immediately after the welcome the royal party, under the guidance of Mr. Hamber and Mr. Arthur J. Hendry, proceeded to the mill. Cards giving some facts concerning the Hastings Saw Mill, and information relating to the departments to be visited, were distributed amongst the guests. The route was marked out by a line of bunting, along which were stationed at intervals members of the Royal Northwest Mounted Police. In order that no part of the route would have to be duplicated, the dry kilns and planing departments, where ceiling, flooring, siding and several varieties of mouldings were being manufactured, were first visited.

Next came the log pond, where several booms were to be seen, and the log slip. His Royal Highness was much interested in watching the huge logs being drawn up from the water, one of which he followed to the log deck. The log deck is always an interesting part of a sawmill to one strange to it, especially when the logs are of the size seen at the Hastings Saw Mill, the largest on this occasion being 8½ feet in diameter and 95 feet long. His Royal Highness was much impressed by the demonstration of mechanical power, and he stood for a considerable time watching the 60 inch circular saws "break down" the big logs. Passing to the opposite side of the mill he watched the 14 inch band saw sawing timbers 24 inches square and over 100 feet long, and their being carried away by the live rollers. Passing successively the second band

saw, the edgers and through the grading, measuring and tallying departments, the royal party proceeded along the electric railway to the wharves and export sheds, where piles of lumber were lying ready for shipment abroad. There were some fine Douglas fir timbers and spars up to 24 inches square and 100 feet in length for shipment to the United Kingdom, Australia, Japan and China; Douglas fir flitches of the best grade for Japan, and rough dressed lumber of smaller dimensions for Australia, the Fiji Islands and other countries. Nearby were some fine timbers from 12 to 24 inches square and from 60 to 90 feet long, ready for shipment to the Atlantic seaboard.

Too much time having been taken up, up to this point, His Royal Highness was unable to visit the picket, lath and broom handle plant, and filing room. The party therefore returned to the administrative building where His Royal Highness was presented with a souvenir of his visit in the form of an illuminated album of photographs, bound in morocco, of the great trees of British Columbia, the processes by which the logs are manufactured into lumber, and its being loaded on ships for transport to all parts of the world. The presentation was made by little Master Eric C. Hamber, nephew of Mr. Eric W. Hamber, and son of the late Captain H. B. Hamber, who was killed on active service with the Royal Air Force. The page opposite the presentation words was the interesting photograph

of the Duke and Duchess of Cornwall and York, now Their Majesties, King George V. and Queen Mary, the parents of the Prince, which was taken on the occasion of their visit to the Hastings Saw Mill on September 30, 1901.

On leaving His Royal Highness expressed himself to Mr. Hamber as being much pleased to have the opportunity of seeing a large modern sawmill in operation, and he thanked him for all the arrangements that had been made for his visit.

The departure of the royal visitor was made amid three rousing cheers and a tiger, led by Mr. Hamber, from the hundreds of employees, invited guests and spectators. The Prince during his tour of the Pacific Coast province was given a most enthusiastic welcome at every point and completely captured the hearts of all by his cheery smile, unaffected manner and unfeigned interest in all that he saw and heard on his trip.

His Royal Highness being received by the president, Mr. Eric W. Hamber

Urge Improvements in Logging Operations

Woodlands Section Says Level of Intelligence and Training of Men Directing Work in the Woods Must Be Raised—Changes in Methods Outlined

In general, there are three ways which could be used to improve and cheapen logging operations.

First, to ascertain where timber is located and its amount, lumbermen cannot cut logs without maps any more than a general can fight battles. If the amount of timber on a given area is not known accurately no accurate estimate of costs can be made, nor intelligent operating plans.

Second, the level of intelligence and training of the men directing woods' operations on the ground must be raised. Logging is a branch of engineering, and engineering training is essential if methods are to be cheapened and improved. In the West, the schools are giving courses in logging engineering with success. It cannot be expected that untrained, uneducated men can run logging operations well, any more than such men could be expected to handle mill operations.

Third, a much greater degree of co-operation between firms operating in the same territory is necessary. Co-operation in making road and stream improvements, in hiring labor and buying provisions, in hauling, driving and all other woods' operations. The woods' managers of various companies and operators in the same territory are still far too suspicious of one another, are continually trying to take advantage and "put one over" on the other fellow, and are still constantly making and breaking agreements in regard to the scale of wages to be paid. Wherever co-operation of any kind has been tried, it has proved successful, and a much greater measure is necessary in the future of logging operations.

The foregoing constitutes the recommendations made by the Woodlands Section of the Canadian Pulp and Paper Association in regard to improvements in logging operations. A committee was appointed by the section two years ago to go thoroughly into the whole subject. The members presented a report at the last annual meeting held at the beginning of 1919. The report which was referred back for further consideration, is as follows:

In considering any possible improvements in logging operations it is necessary first to have some clear idea of conditions in the forests in order to discuss the question intelligently.

Roughly our forests in Eastern Canada consist of the following types, practically pure stands of red pine or jack pine or black spruce, and mixed stands of spruce, balsam and hardwood, the latter covering the largest percentage of area.

Taking the latter type as the most common and the most important, the average number of spruce and balsam trees per acre, 4 in. and up, in the St. Maurice Valley is about 159.5, which, if these were evenly spaced, would mean that on an average acre the trees would be 16.5 apart each way, so that it is readily seen that the cost of cutting and skidding these trees is much more than it would be if the trees were spaced say six feet apart. The hardwoods compose quite a large percentage of the stand and as they are not utilized are only an obstruction to logging operations, as is the small hardwood brush. Then, too, the softwood is likely to be in clumps which are rather widely scattered, making logging difficult and expensive, or sometimes fine large trees stand alone, and as it is difficult to go far from a road for them they are often left by the jobbers.

The highest number of cords per acre 6 in. and up at breast height in the St. Maurice Valley was 19.2, the lowest 11.8 spruce and balsam combined. The figures for Government diameter limit were 16.2 and 6.1, or an average of virgin country well timbered of 12.7 cords 6 in. and up 10.2 cords cut to Government limit.

The highest percentage of balsam was 82.2 per cent. of the softwood stand and the lowest amount was 43.5 per cent. The grand average was: balsam, 64.2 per cent.; red spruce and black spruce, 20.2 per cent., and white spruce, 15.6 per cent. Taking all the trees in a fairly average mixed stand we get the following percentages:

Total stand, 244.9 trees per acre.

Above Government diameter limit, 190 trees per acre.

	% of total stand	% merchantable stand
Under diameter limit	22.42	...
White Spruce	1.76	2.27
Black and Red Spruce	1.84	2.38
Balsam	64.04	82.54
Spruce and Balsam, combined	67.64	87.18
White Pine	.04	.05
Cedar	.23	.30
White Birch	9.27	11.95
Maple	.24	.31
Ash	.007	.009
Other Hardwoods	.15	.20
All Hardwoods	9.67	12.47

General Picture of the Woods

The general composition of the country is roughly: water, 6.15 per cent.; good merchantable timber, 33.8 per cent.; poor merchantable timber, 6.3 per cent.; black spruce, 1.1 per cent.; burnt, not reproducing, 5.29 per cent.; swamp, 42 per cent.; burnt, reproducing, 23.3 per cent.; burnt, reproducing in jack pine, 5.32 per cent.; lumbered, 13.0 per cent.; and settled, 5.22 per cent.

Classified by percentage of total species above Government diameter limit, we have white spruce 28.57 per cent. black spruce, 31.5 per cent., 9 in. and up; and balsam 75.1 per cent. 7 in. and up.

The above gives a rough general picture of the woods we have to operate and show that the quantities of timber are low, making logging more expensive than if the forests were well stocked. We might say that if we called a fully softwood stand 100 per cent., our forests run about 14 per cent. stocked.

As giving some idea of how our logging operations are carried on, an investigation of an average operation carried out in extremely good territory where the stand of softwood was estimated at ten cords per acre, the amount actually cut was 6.4 cords. The balance was not all left standing, but much was wasted in high stumps, long tops, wood used for skids, and roads and lodged trees left.

Now, in order to discuss improvements in logging intelligently, it is necessary to run over various wood's operations and describe them briefly as now carried on and to suggest possible improvements.

The first step is exploring; that is, locating the locality to be cut. This is usually done by some foreman who goes into the woods, picks out the territory to be cut over, and estimates how much he thinks can be cut, and who then takes some jobbers up and bargains with them for the price per thousand and the locality. Some firms have their timber mapped and estimated several years in advance and this locating of and bargaining with jobbers can be done by some higher official in the office. In the latter case, the amounts are known with much more accuracy than in the former, and the cut can be more closely predicted. In the former case, the jobber usually gets a territory with a good deal more timber than he needs and he generally cuts the best and leaves a good deal which is very expensive to get at a later date.

Cutting Plan for Series of Years

It would seem that an improvement in procedure would be to have a map and reasonably close estimate made of the whole territory of an owner; then for the logging manager in consultation with the general management and the superintendent of manufacturing, or the head of the sawmill in the case of a lumbering concern, to make out a cutting plan for a series of years, taking into consideration all of the factors. If a firm did not care to spend the money to map all of its territory at once, it could make maps for one or two years in advance. Knowing just how much timber was in each section and the amount required each year, plans could be accurately made which would get the timber out in the cheapest way; camps could be located for several years, as could roads, stream improvements could be made and the district progressively logged until cut out. Knowing how much timber there was in each tract, the jobbers could be more intelligently handled, and if the amount cut fell below the estimate the blame could be accurately placed.

In examining cut-over territory, it has always been noticed that much less has been cut than it was possible to get, and, as not

enough is left to make it worth while to go back, this timber is entirely wasted.

The next operation is taking in provisions. This is usually done in summer by rail, boat or wagon to the main depots at the end of the summer roads and then the provisions are taken in on "jumpers" or by canoes and the men to the new camps. Sometimes, provisions are taken in the winter previous to cutting and left in caches till the next year in care of a keeper. In hauling from railroad to main depots and from there into the woods two horses, or one horse, waggons, the latter more usually, are used. The only improvement that could probably be made here would be the hauling by small tractors and trailer waggons or sleighs, but this cannot be done until some of the almost impossible grades on the country roads have been materially reduced, as one bad hill in a long haul will determine the maximum load to be hauled, no matter what the length of road. Where portaging must be done over a series of years, the saving to be effected by increasing the size of the average load should be calculated and the road work done to that amount.

Reducing Waste in Camp Building

At present, camps are built of spruce and balsam with pole or tar paper roofs and much good timber is wasted. The average jobbers' camp contains 2,618 bd. ft. and stable 1,700 bd. ft. A camp seldom lasts more than two years, and as an average company operation calls for 347 camps and stables this means 1,300,000 bd. ft. per annum. Camps could be built of hardwood, especially birch and poplar, which would reduce this waste, or camps could be taken down and made into logs when finished with. Some experiments have been made with portable camps made in small sections which bolt together; these have been quite successful and will last for four or five years, especially if painted. The jobbers, on leaving their camps, usually break all the windows and smash things up generally, thus adding to the waste.

Better Methods in Felling Trees

Felling is now generally done with the saw and the days of wasteful chopping with the axe are about over. The principal improvements which can be made in felling are, better laying out of work by the camp foreman, cutting of lower stumps, cutting further into the tops, taking branched trees, taking everything that can be gotten out of a tree, that is, leaving only the part that is actually rotten instead of leaving the whole tree, and cutting all the trees which the law allows instead of leaving isolated trees or those a little difficult to get at uncut. Time studies should also be made so that a foreman should know just what constituted a day's work for a crew. Some idea of the wastes in the above respects can be gained by actual figures covering 347 jobbers for one winter. 6,314 stumps were cut over two feet high, the highest being 3.0 ft. If these stumps had been cut 1 ft. high, by no means a difficult operation, there would have been a great saving of the best wood in the tree. A careful estimate over a large area showed that by high stumps, 4,496 cords were wasted annually. That this waste is due to carelessness was shown by the fact that of all the stumps measured seven per cent. were cut under one foot, many of them down to six inches, and this without any orders to do so. It was also shown that there was a tendency on the part of the fellers to increase the height of stumps as the diameter of the trees increased. The earlier the cutting is commenced in the fall, the easier it will be to cut low stumps. One great source of waste in the St. Maurice Valley is the custom of cutting logs thirteen and one-half feet in length. Trees should be cut so as to get the greatest amount of good timber out of them, regardless of the length of the log. By measuring trees as ordinarily cut it was found that the average length of the top left was 20.1 ft., and that if one piece was taken out of each top, varying from four to 16 ft. in length and 4 in. in diameter at the small end, a saving in one year's cut of 3,000,000 ft. board measure would result. Such pieces cut from the tops would cost no more to haul or drive but would cost more to handle at the mill owing to their small size, but wood smaller than this is being bought from the farmers, and from the Abitibi region as a regular thing. Some other items of waste as shown by records are branched trees left in a winter's operations of cutting about 46,500,000 feet, 276; good logs cut and left in the woods, 2,453; logs 6 in. and up left in tops, 2,441.

Company camps have been tried in years past and were practically forced on some of the operators by the shortage of labor during the past season. So far as is known they have never delivered logs as cheaply as the jobbers could. The Companies usually have to pay more and feed better than the jobbers and cannot get so much work out of the men. Then, too, the camp foremen are not sufficiently intelligent to plan out their work, make time studies and use their heads for the improvement of the work.

Some sort of light portable saw should be developed, run by

gasoline engine which would reduce the number of men necessary in the woods and increase the output. Several types have been invented but, so far, none that is practical for this country.

Skidding, Hauling and Culling

It is hard to think of any improvements which can be made in skidding, except to begin work earlier in the fall and get the logging finished before the snow becomes deep enough to seriously impede the work.

Hauling is done almost entirely today by one-horse sleds. Using double teams increases the cost of the roads and makes snow sheds and ice roads often necessary. It is thought that by using small tractors, hauling say five or six cords to a load, the work can be materially cheapened. Such machines do not need very much work done on the roads and can manoeuvre easily in the woods. By having two sets of sleighs for each tractor, they can be kept running steadily. In their use it pays to have a skilled mechanic to keep them always in good order. An extra machine, or a good supply of repair parts, should be always on hand. As the cost of the machines is low, this is quite feasible.

Culling is one branch of logging which needs a thorough overhauling. The present methods of measurement which have been handed down are neither practical nor scientific. The cullers have not sufficient education to do the work intelligently; they are underpaid and too much work is expected of them. The result is that they often estimate when they should measure. The custom of measuring by the board foot unit should be abandoned and the cord or cubic foot substituted. Many logging superintendents think they are getting the best of the jobber by using the board foot scale, which they think gives them a large over run, but even in the case of saw timber the mill men seldom know accurately just what the over run is. By using the cubic foot, buyer would know just what he was getting. The change would be of great value to the paper and pulp mill, which carries out all its other measures in cords. As there is no possible means of exactly changing amounts in board feet to amounts in cords, the mills are at a disadvantage. If the whole subject of logging measurement were put into the hands of an expert for development, many improvements could be made. A self registering caliper for measuring logs has been developed and a model made by one of the instrument-making houses.

Reducing the Cost in Driving

The great importance of river driving and the length of time it has been used should have greatly increased the efficiency of it, but so far as can be seen this is not the case. The work has been left to men without engineering experience or education and is apparently run more by tradition than anything else. As the amount of water is the principal determining factor, and as this is at its maximum only for a short period in the spring, there should be a large enough force on hand to see that the drive starts promptly and that the stream is kept continually full of logs. The number of men required on a drive should not be computed by the number of logs but by the difficulty of the stream; there should always be sufficient to keep the logs moving. Most of a crew's time is spent in breaking jams which should never be allowed to occur. Leaky dams are another factor of waste as these take longer to fill up than tight ones and the crews are often idle while dams are filling up. If accurate estimates of the amount of timber to come on a given stream were available the amount to be spent in improvements could be accurately gauged, and these could often be done co-operatively when a new territory was opened up, thus cheapening the drive for years to come. Short booms placed at sharp ends and dangerous points in a river would often reduce the danger of jams materially, at a low cost. Plenty of men should be used at dangerous points instead of being strung along the course of a creek or river. The number of drowning accidents is far too large. This could be decreased by furnishing the men with light life belts which would not impede their work. One company has already purchased some of these. There should be more co-operation in driving the small streams than at present.

Abolish Present System of Sorting

Sorting is part of the lumbering operation which should be given up altogether in its present form. All the logs put into any certain stream by the operators upon it should be pooled, and a man placed at the log haul of each operator on the river to measure the logs taken up. In this way the enormous number of men now used at the sorting gaps on rivers where the same logs are often gone over two or three times would be eliminated, and adjustments could easily be made between the cullers' sheets for logs delivered on the streams and those taken out at the log hauls. The only obstacle to this scheme is that each operator insists that his logs are bigger than anyone's, without really knowing anything about it. Even if this were so, it could easily be adjusted.

New Position for Mr. C. J. Brooks

Charles J. Brooks, Toronto

Chas. J. Brooks, who for the past two years and a half has been Eastern representative of the Vancouver Lumber Co., with headquarters in Toronto, is leaving in the near future for Vancouver, where he has been appointed to a responsible position with E. C. Walsh Lumber Co. of that city, who are wholesalers and manufacturers, with mills at North Vancouver, having a capacity of about 50,000 feet a day, sawing principally fir. The many friends, which Mr. Brooks has made during his residence in Toronto, while regretting his departure, will join in expressions of hearty well wishes for his continued success in the lumber arena. Mr. Brooks, who was born in Prince Edward Island, has had a thorough experience and insight into all branches of

the business, and is, therefore, well equipped for the new duties which he is undertaking. His first position was with Chappell Bros. & Co., of Sydney, N. B., where he spent four years in their factory. He was next engaged in logging work in New Brunswick and then joined the staff of Murray & Gregory, Ltd., of St. John, being first in the shipping department and later in the office. Going west, Mr. Brooks took a position with the Moose Jaw Sash & Door Co. as shipper and foreman of their stock-cutting departments. He spent three years with this organization and then was with the Rat Portage Lumber Co. in their plant at Norwood, Man., in which he devoted his attention particularly to machine work. Nine years ago Mr. Brooks went to the Coast and joined the Vancouver Lumber Co., where he was first in the shipping department and subsequently on the selling staff. He came East nearly three years ago to assist Mr. C. J. Plant (now sales manager of the company) in his work in Toronto, and on the departure of the latter for the West, Mr. Brooks was appointed manager of the company's interests in the East. He has always taken an active interest in the welfare of the industry in general and has been aggressive in looking after sales of B. C. forest products for his firm.

K. M. Brown of Vancouver, who succeeds Mr. Brooks as Eastern representative of the Vancouver Lumber Co., has arrived in Toronto and is assuming his new duties. Mr. Brown has been for some time on the head office staff of the company and is thoroughly familiar with the industry as a whole.

Export Outlook for B. C. Timber

Speaking of the export lumber trade a leading paper of Vancouver says: If lumber shipments to Great Britain from this province continue at their present rate during the next month or so, at the end of that period the mills of the coast will have completed the large order placed with them by the British government, and must turn their attention to securing orders elsewhere. According to statements made recently by several prominent lumbermen of this city, it is hardly probable further orders will be given out by the government, and it will, therefore, be left to private enterprise to shoulder the responsibility of providing export markets for one of British Columbia's most important industries. With the exception of the Hastings Mill and the Dollar Mill, which have been giving serious attention to export trade for some time, very few of the mills of British Columbia had given much thought to securing trade across the seas. One or two of the mills had been shipping to the Orient and to Australia, but the trouble with this trade was that when the demands of the Canadian prairies became more insistent, export business was allowed to go by the board, being picked up again only when the need for greater scope in marketing made itself felt.

Like every other industry, the export trade to the lumbering industry is one of the most vital factors to its development. It is true that the trade of the prairies has furnished reason for extension of some of the plants on the coast, but the market there is limited, is canvassed by competitors from Eastern Canada, and to a very great extent depends upon the crop conditions.

The tremendous importance of export business and how it should be vigorously pursued, as a source of expansion, achievement and inspiration, is conceded by all. But so far, as has already been mentioned, with the exception of occasional efforts to establish a

footing abroad, no really consistent attempt has been made by the lumbermen of this province to capture the great market that is offered to them, not only in Europe, but in the Far East, in Australia and in South America. In Japan and China there is a market for our lumber that will absorb the entire output of British Columbia for many years to come, if it can only be secured. In China, more particularly, opportunities are offered that do not exist elsewhere.

Opens Lumber Market and Exchange

A. T. Smith, who for some time has been selling lumber, has opened the Lumber Market and Exchange, Toronto, with offices at 34 Victoria Street. The object of the new organization is to render prompt service both to wholesalers and retailers in the matter of stock and all business is done on a two per cent. commission basis. The Exchange has lists of various kinds of lumber that are available and when a purchaser is in need of any material of whatever kind, thickness or grade, information will be readily furnished where it can be obtained, where located, price, shipping facilities, etc. Mr. Smith states that, by his new system, he is able at all time to give quotations and place orders with any of the reliable wholesale merchants in Toronto or Hamilton with whom he has made arrangements to sell their stocks at rock bottom prices and this convenience eliminates the present method of telephoning or writing several firms. Both hard and softwoods are being handled.

Paper Company Adopts Forestry Branch

The Abitibi Pulp & Paper Co., whose plant is at Iroquois Falls, have organized a Forestry Department. The scope of the Department is a large one and has been concentrated under the general heads of Nursery, Engineering, Protection and Investigation. A splendid site has been selected adjacent to Twin Falls and 10 acres of land have been cleared and prepared ready for actual operations in the spring of next year. It is proposed to clear and prepare a similar 10 acres annually until a maximum of 50 acres is reached. Here will be developed the stores of supply for the Reforestation branch. The nursery will be placed on such a basis as to give an annual yield of from 1,000,000 to 2,000,000 4-year-old trees. As the first stock grown from seed will not be available to the Reforestation branch until 1922 and 1923, the company will purchase plantable stock of from 3 to 4 years in age in order that the Reforestation department may commence operations in 1920.

Will Build New Mill at Oromocto

Robert B. Smith, M.L.A., of Oromocto, N.B., manager of the River Valley Lumber Company, Ltd., was in St. John, recently, arranging for the purchase of the Flewelling mill at Hampton, Kings County.

It is the intention to take the machinery from this mill, which was completely equipped with gang and rotary systems, and remove it to Oromocto, where it will be used in the new mill which the River Valley Lumber Company will erect to replace that which was destroyed in the recent fire which almost swept all of Oromocto off the map.

The Flewelling mill was formerly used in the manufacture of lumber, from which the wood for the old-fashioned matches, made at Hampton in large quantities, was supplied and the machinery is said to be in excellent condition.

It was said that Mr. Smith plans to start immediate operations to dismantle the Flewelling mill and thus be able to have the machinery towed to Oromocto before the close of navigation, which would make it possible to have the new mill built and ready to commence sawing in the early spring.

New Lumber Company Obtains Charter

A provincial charter has been granted the Empire Timber, Lumber & Tie Co., Ltd., with headquarters in Toronto and a capital stock of \$85,000. The company is empowered to carry on the business of lumbermen and saw and planing millers and to buy, hold and deal in timber limits, timber lands, logs, etc., as well as to manufacture ties and all articles made of wood. R. H. McKee, who is at the head of the Ontario Lumber and Supply Co., Limited, with offices at 408 Tyrell Building, King Street West, Toronto, is president and manager of the Empire Timber, Lumber and Tie Co., Limited, which, it is understood, will embark in the retail line and has acquired suitable premises at 358 Greenwood Ave., Toronto. The Ontario Lumber and Supply Co. will devote its entire attention to the wholesale line.

A charter has been granted to the Economy Timber Co., Limited, of Courtenay, B. C., with a capital stock of \$25,000.

What Wholesaler Does for Lumber Business

An Indispensable Link in the Chain of Distribution who Stimulates Production and Sales and Increases Purchasing Power of the Consumer

By Louis Germain, Jr.

This need for economic lumber distribution developed the wholesaler, who by reason of his knowledge of the various kinds of lumber manufactured in all sections of the country, required by the consuming public, and his ability to handle these various kinds and species of lumber in different places, and in large quantities, has for forty years made it possible for the wholesaler to serve the consuming public by supplying any or all species needed at a minimum cost of distribution.

The term "wholesaler" has often been misapplied and confused with the commission agent, the jobber or the broker, none of whom perform his function, so in referring to the wholesaler we should clearly recognize that in distributing the manufacturer's product in carload lots of lumber to either the individual consumer or to the retail yard, he acts independent of either, or both, he is engaged in buying and selling lumber at wholesale for and on his own account, advances money in payment therefor, takes title to the lumber at point of production, assumes transportation hazard and risk and customarily extends credit to his purchasers, thus carrying the burden of finance and credit risks with resultant necessary services to both of his clients.

Naturally, considering the many classes of lumber distributed, the types of wholesale organizations are many and varied, but the legitimate wholesaler will be found as performing necessary functions in the industry.

Having defined the wholesaler, it is interesting to note that of the total mills in the United States, only about three per cent of the mills who produce about forty-seven per cent of the total, distribute their own product either through their own selling organization or through mill selling agencies; the remaining ninety-seven per cent of the mills being dependent upon the wholesaler to a greater or less extent for the disposal of their product. There are approximately three thousand five hundred wholesalers serving approximately twenty-five thousand retailers and wholesale consumers of lumber the country over. The capital investment in the wholesale lumber business undoubtedly amounts to more than one billion dollars, and the organization of especially trained experts employed by wholesale firms has been estimated at approximately one hundred thousand persons.

These facts lead to the consideration of what functions the wholesaler performs, and whether or not he is an economic necessity in service to the consuming public, to the mills large and small, and in the scheme of democratic industrial order which the policy of our government has fostered.

Indispensable Sales Force

The wholesaler furnishes an absolutely indispensable sales force to the small mill operator. He is the agent through which the smaller manufacturers have been and are enabled to effectively and vigorously compete in the sale of their product.

He places at the disposal of each mill an efficient sales organization which it would be impossible for a single small mill to maintain independently. The mills can be divided into two classes—timber or dimension mills and board mills. To the former the wholesaler is indispensable. He furnishes special cutting to suit available timber. Most mills in the Eastern and Southeastern states are of this character.

Not only does he save the small mill and the capital investment necessary to maintain a sales organization, but he also actually helps to finance most mills, both large and small, by paying cash, or from 75 to 90 per cent. of the mill value, for lumber at the time of shipment. Among many mills he makes cash advances to enable such mills to buy additional timber or equipment, to meet pay rolls or to finance surplus lumber stocks, which would otherwise be dumped upon the markets at times when they could not be absorbed.

He is also the agency through which odd lots of stock are efficiently marketed, where they can be used to the best advantage or in substitution for other kinds of lumber, to very material saving for the mills.

The wholesaler purchases generally at the mill, assuming the responsibility of risk, damage or delays in transportation or losses due to railroad overcharges on both weight and freight rates. He

assumes the sales credit risk and conserves to many mills their limited capital for increased production, at all times guaranteeing a market for his goods without usual sales worries, thus permitting the manufacturer to give his entire time to the details of production.

To the consumer the wholesaler supplies varied services.

Adjusts Market Demands to Supply

Through his efficient sales organization, with direct personal contact with individual buyers, the wholesaler is able to give information to the consuming public as to the most acceptable kind of lumber available at lowest market prices suitable to each buyer's use, and by substituting, at times, lumber from one territory, in place of another, supplies the consumer with the most efficient character of lumber suited to his use at the lowest available market price, thus helping to adjust to the public demand with resultant conservation in the industry.

This same constant contact with the consumer together with the wholesaler's knowledge of available stock at various mills, permits delivery from points taking the most advantageous freight rate to the benefit of the consumer, since on many classes of lumber the freight is from 25 per cent to 45 per cent. of the total delivered selling price and a big factor in establishing market values at points of consumption.

Shipments from points of production where stocks are most available and obtainable at the lowest freight cost consequently permit the wholesaler to equalize conditions in various manufacturing sections as well as to stabilize market prices to the consumer at delivery point.

Effects Economy of Service

In meeting the requirements of the large consuming trade, more particularly the industrial trade and manufacturers, who require lumber in large quantities for remanufacture, or in the handling of large orders of all one size or quality or orders of very difficult character or mixed orders covering various kinds of lumber, the wholesaler, having at his disposal the product of many mills located in different sections, can meet this greater variety of demand more promptly and efficiently and by handling same through the one selling organization can more efficiently serve the consumer at a lower cost for such service than could any one individual or group of manufacturers seeking such trade in competition from various sections of the country.

Large contracts of all one class of size of material that could not be handled by any one manufacturer, are distributed through the wholesaler to many mills whose timber is especially suitable for such special cutting, thus giving the buyer the benefit of securing production from many sources of supply at competitive cost prices, but with the saving in energy and time to the consumer in having to deal with one agency.

Consumers Depend on Wholesalers

Acting as he does, for a large number of industrial and consuming users of lumber, notably the railroads, large industrial plants who require lumber in large quantities for their own products, the expert knowledge of the wholesaler with his intimate acquaintance with the grades and classes of lumber produced in various sections provides to such buyers services that they could not secure unless they organized individual departments to purchase requirements at much higher cost to themselves than the service charge paid by them to the wholesaler.

Many such buyers are entirely dependent upon the wholesaler's knowledge, as the same market would not be available to them except at a greater cost and loss of energy to themselves were it not for the organization of the wholesale distributor whose services to them are indispensable.

While in a general way the wholesaler finances most of the manufacturers, he at the same time assists all commercial buyers in their financing by extending terms of payment to the consumer that permits him the option of either paying cash on delivery or settling by note or trade acceptance. This, in many cases, especially among the small retail yards, small industrial plants and in large building contracts, allows renewals of these notes from time to time

*Address delivered before the recent Northern Lumbermen's Salesmanship Conference at Antigo, Wis.

with a considerable assistance to the purchaser in carrying the burden of his own financial requirements.

The wholesaler, in all cases, carries the financial burden, and in many cases, makes it possible for the consumer to take orders which he otherwise could not handle with his own restricted banking facilities. In this way it is estimated that the wholesaler more than doubles the consumer's purchasing power and banking credit, and in that way performs an especial service to the general public, keeping in the industry many small operators, both manufacturers and retailers of a competitive nature who would otherwise be unable to function, and who at all times tend to level market values.

In addition to stimulating retail sales of lumber by reason of extension of credit, in turn the wholesaler, especially during present abnormal times, performs a special service to the extent of stimulating production at the sources of supply by financing mills in the production of small bodies of timber that could not be handled by the large mills, and in that way materially assist the public in conserving to their use timber that could not otherwise be placed upon the market. This function of the wholesaler is more especially appreciated at the present time when stimulation of production is needed to meet the enormous present demand.

Function for Public Benefit

In many other ways, various types of wholesalers function for the benefit of the public, such as guaranteeing to the small buyer delivery of material at a fixed price, f.o.b. destination, establishing a fixed cost of the lumber delivered at his plant and protecting him against the usual transportation hazard, risk or overcharge. Also, through their buying organizations many wholesalers supervise the manufacture, inspection and shipment of lumber at the mills, saving to the consumer at the cost of sending his own inspector to the mill and saving losses to the mills in supervising their grades to meet the qualities required by the consuming public.

Adjustment of claims, due to mismanufactured stock, damage in transit, re-inspection, through personal contact of the wholesaler, permits of fair and equitable adjustment to the mutual protection of both manufacturer and consumer. This is a service much needed but very often misjudged.

Securing empty cars for loading at points where cars are needed, tracing shipments in transit, diverting lumber that is needed to markets in dire need, re-routing of cars to avoid embargoes or congestion, shipping by water to sections of the country where water delivery can be accomplished, and looking after the many other intricate details of transportation that are most necessary to the distribution of lumber, and burdensome to the consumer, are services to both other branches of the industry which are performed daily by the wholesale distributor.

Wholesaler Has Won Place

In conclusion, it is found that the wholesale distributor has won his place and is an indispensable economic necessity, due entirely to the functions and services he performs and due to the absolutely competitive and independent factors that prevail in industry in keeping with the principles of business freedom assured us under our democratic form of government.

The war has given a great impetus to socialism. The present labor unrest is due to this influence. Socialism means Government ownership, not only of the telephones and railroads, raw materials and manufacturing plants, with centralization of power and finance, and with the entire loss of personal initiative so productive under our present order of business democracy.

The greatest enemy that socialism has to-day is democracy. The greatest saviour of civilization and independence to-day is democracy.

Business Can Preserve Democracy

You can best preserve democracy how? By preserving business and industrial democracy, by conserving competition, by conserving potential but fair and honest competition. By preserving individual initiative, individual opportunity; by preventing monopolies by law, as the Sherman law has done. I do not mean that there should not be great units and large organizations of capital or industry, as a great saving can be accomplished to the general public by economies of such organizations, and the benefits of large scale productions with reduction of overhead cost both in manufacturing and distribution, but these organizations should not be of such character as to become monopolistic in control.

Co-operation, but independence of the various branches in industry, is the salvation to business democracy.

Co-operation in our industry of all three branches—the manufacturer, the wholesaler, the retailer—is necessary, but it must be of such character as to preserve competition. The competition must be clean, fair and honest, and of such character that men can grow, no matter how small their beginnings may be, so long as they have the ability, the energy, the enterprise and the courage to do honestly and to do successfully. There is room with ample return for both capital

and energy for the prosperous growth of all three branches of our industry and through honest co-operation their interests can be so united to better educate the public as to the services and functions performed by each and by preserving fair competition in the industry, a greater service can be rendered by all to the public in general in keeping with the wonderful opportunity of our great business democracy.

How Far Does Your Trade Extend?

The retailer's local community, as shown by the accompanying diagram, may be confined to the area of the inner circle, designated "0," or it may overflow into the surrounding territory designated "1," "2," "3" and so on.

In the diagram, "0" represents a territory two miles in diameter, containing 3.14 square miles, or 2,010 acres. A town occupying this area may have a population of from 3,000 to 5,000, or from 600 to 1,000 families—say, on an average, 750 families.

The belts of territory surrounding "0" have a breadth of one mile. In the case of cities, their area will take in one or more of these belts. The acreage of each belt is indicated in the accompanying table. Allowing 4 to 5 families per acre, on an average, the approximate urban population of each belt in the city area can be computed. In the table following a town of 750 families is assumed, all contained within the circle designated "0." The rural territory begins with belt No. 1, and extends, in the diagram, to a distance of 21 miles out from the retailer's place.

The retailer's field, before serious competition from other neighboring towns or cities is encountered, will almost certainly take in Belts Nos. 1, 2, 3, 4 and 5, and may take in a number more. Each retailer will know just how many of these mile-wide belts he can fairly count as his own field.

The accompanying table will suggest to each retailer the approximate number of families residing in his field; and suggests the amount of their probable annual consumption of the particular class of merchandise sold by the retailer. It is for the retailer himself to ascertain just how many families in his field he is serving regularly, and how close he comes to doing all the business which his field is able to yield him.

The significance of the accompanying diagram is interpreted in the reading matter above. The centre of the inner circle, marked "0," represents the retailer's store, or the heart of the local business community. The circular strips or belts marked 1, 2, 3 and so on, represent mile-wide areas surrounding the local business community.

The area of each of these belts, expressed in square miles and acres, is given in the table accompanying, as is also the probable population by families. The amount of business which the retailer's field should yield is likewise indicated.

James R. Summers, wholesale lumber merchant, Toronto, and wife have returned from an extended motor tour through Northern Ontario, going as far north as Sturgeon Falls. Mr. Summers managed to do some duck hunting while away and had good luck. He reports that the roads for the most part were in good condition and that many improvements are being made to the highways.

Cut on Ontario Crown Lands Will be Large

Reports from Various Timber Districts in Province Generally Reveal Extension in Operation — Increasing Costs Will Make Lumber Sell for Higher Figures

It is interesting to review conditions and activities in various parts of Ontario during the past season so far as they pertain to crown lands. For the information presented in this article the "Canada Lumberman" is indebted to the Crown Timber Agents of the province, who are closely in touch with the progress and development of the lumber, tie and pulpwood industry.

Everyone is looking for a large timber cut in the Port Arthur district during the coming season. It is too early yet to give data, because none of the tie contractors have closed or signed up contracts for this season's output, according to J. A. Oliver, Crown Timber Agent. Everyone is, however, expecting a record production. The tie contractors, so far, are holding out for a raise in price over last season, while the railways are holding out for a lower figure. In connection with pulpwood for export, the pulp companies are offering a slight raise over last winter, while the contractors are anticipating the same. Generally, conditions are about identical with those of last year. Some classes of labor are demanding higher wages than last spring and, in addition, supplies are more expensive, particularly hay and oats. It is too soon to speak with any assurance regarding the supply of labor. The Port Arthur district generally gets some benefit from the harvesters returning from the West, and also from the dock employees and elevator employees who quit when the shipping season is over on the Great Lakes. At present, there is not sufficient bush labor. No new saw mills are going up in the Port Arthur district, although some small settlers' mills have been put in.

A report received from Crown Timber sources in the Thessalon district states there will be about 100 per cent. increase this season in the output of logs. Wages of lumberjacks run from \$65.00 to \$70.00 per month, with board, while camp supplies are very high. Hay and potatoes are some 40 per cent. above last year's quotations, and it is believed that it will cost 10 per cent. to 15 per cent. more this season to get out logs than it did last year. There will not be many ties taken out in Algoma and the total amount will not exceed 5,000, while the production of pulpwood will be limited—about 5,000 cords in all.

W. P. Christie, of Parry Sound, who is the Crown Timber Agent in that district, remarks: The outlook for the coming season in this agency looks better than the past few years, and the prospects for an enlarged cut this winter appear bright at present. The operators in this district find men more plentiful and wages and other expenses compare well with last season. For the past few years the output of ties and pulpwood has been small. The Schroeder Mills and Timber Company, who are heavy operators in Mowat and Blair townships, have purchased the mills formerly owned by Lauder, Spears and Howland, situated in the township of Mowat, and will cut part of the output at that mill and the balance of their logs will be put on the market for sale. In all their operations in past years the Schroeder Co. sold their stock of logs to other lumber companies in Ontario.

P. J. Whelan, Crown Timber Agent of Arnprior, says: As far as I know at the present time there will be taken out in this district during the present season, around sixty million ft. B.M. of lumber, and about twenty thousand cords of pulpwood, and two hundred thousand ties, on crown lands under license. On settlers' lots and lands, on which there is no crown dues, there will be around twenty million ft. B.M. of lumber, and thirty thousand cords of pulpwood, and one hundred thousand railway ties. Men seem to be fairly plentiful, and wages run from \$55 to \$65 per month, but experienced bushmen like we used to have in the days gone past, are scarce.

George Bremner, Crown Timber Agent of Cochrane, gives the following summary of the timber situation in his district: Men seem to be quite plentiful, only the lumbermen have difficulty in holding them. Wages are about \$65.00 per month with board and other expenses a little higher than last year. The output in pulpwood last year would be somewhere near 250,000 cords. The tie production in this district is not large, perhaps about 200,000 ties. There is only one new sawmill being erected so far and it is at the crossing of the Driftwood River on the Canadian Government Railway. It is being built by the Carol C. Critsinger Corporation.

Wm. Margach, the Crown Timber Agent at Kenora, observes that it is too early in the season to give definite data regarding the timber cut in 1919, the season for which the Agency prepares reports

really beginning about October 1 and ending about April 30 or May. Mr. Margach adds: Hardly any camps are operating as yet, there being practically no summer cutting, and the camps will really not be in operation for, at least, another month or six weeks. I might say that men seem a little more plentiful and really a better class of men, this being the second and third year for some of them. No new sawmills are being built in and around Kenora.

Another representative of the Crown Lands Department, writing from New Liskeard, Ont., states that he does not expect lumbering operations will be very much changed from last season. Men are scarce and hard to keep, and wages are much the same as last year.

In regard to the timber operations in the Sault Ste. Marie district, A. H. Huckson, Crown Timber Agent, believes there will be a slightly larger cut this season than last. Two firms are taking out waney timber and there will be an increase in pine operations owing to the fires last summer. Labor conditions are a little easier than last season but wages are slightly higher and other items of expenditure about the same. Last season there was a cut of about 6,000,000 feet of pine saw logs, 125,000 cubic feet of waney timber, 75,000 railway ties and 160,000 cords of pulpwood but this season there will be a larger increase in all these lines with the exception of pulpwood.

A new sawmill is being erected at Searchmont by the Searchmont Lumber Co. (of which Hon. George Gordon, A. B. Gordon and others are members) who have six townships in the district. A new company formed in the United States is opening up an operation in the township of Pennyfeather and intend erecting mills for the cutting of hardwood and other timber. The township of Whitman has been acquired by the Horner Lumber Co., of Reed City, Mich., who intend building a sawmill for hardwood at Glendale.

S. J. Hawkins, Ontario Timber Agent at Webbwood, asserts that there are about forty-six camps in that district, which is double of what there were last year. Men have become more plentiful during the past few days and some of the camps are about filled up. Wages run from \$60 to \$65 per month while other items are about the same as last year with a few higher in price. In regard to the output of 1919, Mr. Hawkins states that he cannot give any estimate as yet but last year it was very small. Very little pulp wood and ties are being cut in the Webbwood district; only what the farmers get out.

Next Logging Congress in Vancouver

The annual meeting of the Pacific Coast Logging Congress which was held in Portland, Ore., was one of the largest ever and the 1920 gathering will meet in Vancouver.

The new president is Arthur Hendry, of the British Columbia Mills Timber and Trading Co., Vancouver. The papers read at the sessions were all of a practical and helpful character and among the delegates from B. C. were W. R. W. Armstrong, secretary of the B. C. Loggers' Association; J. Garrett, of the Munn & Kerr Co.; F. R. Pendleton, Wm. Hanson, F. Wilkinson and J. W. Wilkinson, of the Wilkinson Co., Vancouver; E. J. Palmer, Victoria Lumber and Manufacturing Co.; J. M. Dempsey, of the Dempsey Logging Co.; G. G. Johnson, Capilano Timber Co., North Vancouver; H. B. Gilmour, B. C. Workmen's Compensation Board and W. Rae.

One feature of the congress was the introduction of movies and slides of equipment that was handled by those who read papers.

The list of officers for the coming year is: Pres., Arthur Hendry, Vancouver; vice-president, Joseph Irving, Everett, Wash.; secretary, George M. Cornwall, Portland, Oregon; Executive: Oregon, A. S. Kerry; Washington, Wm. Chisholm; British Columbia, W. W. Johnston; California, W. W. Peed (retiring president); Idaho, W. D. Humston; Montana, E. H. Pallies.

November 11 has been definitely set as the date for the holding of the Forestry Conference in Syracuse, N. Y., at which Col. H. S. Graves, Chief of the United States Forest Service will come to New York state to discuss with all interested organizations his proposed National Forest Policy. This date has been set, with the consent of Col. Graves, so as to make it possible for the manufacturers, retailers and dealers in lumber, foresters, those interested in all phases of conservation, to attend and hear Col. Graves explain his proposed program.

Canada's Great Forests Are Extolled

But Time is Not Far Distant When Spruce May be Exhausted, Says Leading Authority

C. Price-Green, Toronto

value of the chemist and the wonderful work he has wrought in industrial development and his place in finding a use for the raw products of mine, field, water powers, forest and fisheries.

Referring to the timber wealth of the Dominion, Mr. Price-Green remarked:

Canada has the largest forest area within the British Empire, and its pre-eminence as a paper-producing country lies in its possession of 350,000 square miles of pulpwood forest which, it is estimated, will yield over a thousand million cords of pulpwood. Upon these forests America is largely dependant for her news print. The more important of these forest areas lie along the line of the Canadian National Railways, in the provinces of Ontario, Quebec, New Brunswick, Nova Scotia and British Columbia, and support the leading manufacturing industry of the Dominion of Canada. In 1890 Canada's export of pulp and paper products amounted to but a hundred and twenty dollars; in 1918 they reached a total of over 71 million dollars.

Considering the huge demand and rapid consumption of paper, these resources afford attractive openings for pulp and paper mills for the manufacture of sulphite, sulphate, mechanical pulp and news print. As there are throughout these areas, many important water powers, the economic value of these forests can readily be recognized. A few facts regarding the consumption of pulpwood for newsprint will give some realization of the rapid rate at which the forest products of the world are being consumed. The newspapers of Chicago alone, consume daily equal to more than 5,000 average size spruce trees, and one edition of Chicago's largest newspaper requires the spruce of 30 acres of forest. With but one-fifteenth of the world's population the United States consumes one-half of the world's production of paper. At the present rate of consumption and destruction by fire, insects and fungus growth, one is forced to the conclusion that the time is not far distant when a substitute will have to be found for spruce, in the making of news print, and one of the most likely sources of supply is to be found in the vast quantities of straw from the grain growing area, which, at the present time, is being wasted.

The most valuable stands of timber remaining in Canada lie in British Columbia, tributary to the line of the Canadian National Railways. It is estimated by the government that these contain no less than 52 thousand million feet of merchantable timber, including such varieties as Douglas fir and silver spruce; from the latter, during the war, the stock for no less than 35,000 aeroplanes was taken out. * * * * When one considers its vast undeveloped areas, with its known resources, one must be convinced that Canada is on the eve of a period of great activity, for it is only since the war that the people of the world at large have awakened to its wonderful possibilities.

The question naturally suggests itself, if Canada has all this material wealth, why does she not develop it herself? The answer is that Canada needs men and money more than anything else to support increased production. She has only eight million people and they have accomplished perhaps more than any other eight million in history. Her war record is sufficient in support of this statement.

In a comprehensive address delivered recently by Mr. C. Price-Green, of Toronto, Commissioner, Industrial and Resources Department, Canadian National Railways, at the National Chemical Exposition in Chicago, the speaker said:

One of the important phenomena of this progressive age is that business men, as a result of the war, have become more or less practical economists. Though they may never have read a word on the subject, they have come to regard their business in its relation to world trade. One hears the question of the balance of trade, exchange, the labor situation and kindred topics discussed by the man on the street as common topics of conversation. In like manner the manufacturers now see the creative

Four Billion Dollar Sale of Lumber

The largest lumber transaction in the history of the world has just been completed by the sale of all the surplus lumber and timber belonging to the Emergency Fleet Corporation to the American Lumber Sales Co., with headquarters on the 12th floor of the Colonial Trust Building, Philadelphia.

The American Lumber Sales Company is a corporation formed for the purpose of purchasing this material from the Fleet Corporation.

Mr. Walker, the president and executive head of the new company, is well known to the lumber trade. He is the president of the Lumbermen's Bureau and of the American Woods Export Association, with headquarters at Washington, D. C., and recently completed a two years' investigation of the European lumber markets on behalf of the Department of Commerce and of the National Lumber Manufacturer's Association.

Through its contract with the Emergency Fleet Corporation the new company comes into possession of approximately 100,000,000 feet of lumber, located in forty-five shipbuilding and storage yards along the Atlantic and Gulf Coasts. This is the largest stock of lumber in the world, and as 50 per cent, of it is located in the large consuming markets of the East, it is thought that the placing of this material on the market will relieve, to a considerable degree, the great shortage of lumber which has existed in these markets for many months. Thirteen months' time is allowed in which to market this stock. The American Lumber Sales Co. is planning to export considerable quantities of this material to be used in the rebuilding of the devastated areas of Europe.

The lumber involved in this sale is largely long leaf yellow pine, although there are also considerable quantities of Douglas fir, cypress and oak. This material was got out during the war in connection with the wooden shipbuilding program, which was terminated with the coming of the Armistice, and the forests of the country were culled over to secure the finest timber available for this purpose.

The prices at which this material was purchased have not been announced, but it is understood that the total transaction involves approximately \$4,000,000,000.

Included among the various yards which are being taken over by the American Lumber Sales Company in connection with this transaction, is the rail and water yard and complete milling plant of the Edward F. Henson Company at Philadelphia. This yard has been under lease to the Emergency Fleet Corporation and this lease is being assumed by the new company.

Recent Timber Arrivals in Liverpool

The timber report of a leading Liverpool timber broker furnishes the following information:

Imports during August were larger than for some time past and deliveries, though hampered by congestion at the docks and railway depots, have been fairly satisfactory. Stocks, almost without exception, are within moderate compass. There has been no material change in the business of the past month, although with the labor outlook becoming more settled the future is regarded with more confidence. Until the freight position improves and the foreign exchanges become more stabilized, business will continue difficult.

The following table shows imports on timber into Liverpool during August, and total stocks on August 31:

Commodity	Import	Stock	Price, September 1.
Quebec waney boards	50,000 c. ft.	50,000 c. ft.	6s. 6d. to 10s. per c. ft.
British Columbia & Oregon		126,000 "	Logs—5s. 6d. to 7s. 6 d. per c. ft.
pine logs and planks	Nil		Planks—£38 to £46 per std.
Oak planks, Canadian and American	150,000 c. ft.	109,000 "	6s. per c. ft.
Birch logs	23,000 "	18,000 "	5s. to 7 s. per c. ft.
Birch planks	40,000 "	47,000 "	6s. to 8s. per c. ft.
Quebec pine deals	1,950 stds.	3,060 stds.	£43 to £65 per std.
Quebec Red pine deals	770 "	1,085 "	"
Quebec Spruce deals	1,150 "	960 "	"
New Brunswick and Nova Scotia Spruce and pine deals	4,320 "	6,960 "	Spruce—£27 to £33 per std.
Sleepers and crossing, Canadian and United States	610 "		

Good Progress Made on New Mills

Clarke Bros., Limited, of Bear River, N. S., report that construction is being carried on with satisfactory progress in connection with their new sawmill and new sulphate pulp plant, and that they are also making readjustments and extensions to their woodworking establishment at Lake Jolly. Clarke Bros. will be operating about the usual number of lumber camps during the coming winter season. The labor situation is somewhat difficult, wages and the cost of camp supplies all being higher than in 1918. The work in logging operations is just starting.

The busy waterfront at Buctouche, N.B., showing sailing vessels laden with lumber and other products from the industries of J. D. Irving, Ltd., whose factories and buildings cover a floor area of over 135,000 square feet. The storage sheds and warehouses are seen in the background.

Some of the splendid logs owned by the Finger Lumber Co., Ltd., of The Pas, Man. The logs are driven down the Carrot river into a storage boom, located where the stream empties into the Saskatchewan. The company are the pioneers in the lumber industry in Northern Manitoba.

Western Provinces Adapted to Tree Growth

During a recent address Robson Black, of Ottawa, secretary of the Canadian Forestry Association, in speaking before a gathering of financial men in Winnipeg said:

"Forestry is the science of obtaining maximum profits from a great natural resource. It is concerned with growing repeated crops of timber on non-agricultural soils. 75 per cent of Manitoba is under the growth and not more than 35 per cent. of the whole provincial area will ever pay a profit to the farmers' plow. One half of Saskatchewan and two-thirds of Alberta are adapted by nature for the growing of profitable crops of timber. The timber is the largest crop in point of acreage, and in view of the experience of such provinces as Quebec and New Brunswick and nations like Sweden, it offers possibilities that some day may rival the profits from grain.

"Since confederation the forest areas of Canada have been responsible for over 1,500 million dollars of export trade as compared with 2,000 million dollars received for cereal crops. This year pulp and paper exports alone from the spruce growing sections of Quebec, Ontario and to a smaller extent from British Columbia have jumped to 120 million as against 120 dollars in 1890—a million times as great."

Mr. Black told how spruce areas in United States and Canada were making enormous rises in value. 40 million newspapers a day are produced on this continent and this publishing industry alone makes incredible demands upon the very limited sources of spruce wood supply. Several American newspapers stripped from 15 to 30 acres of forest for each Sunday edition turned out. The Winnipeg daily papers were consuming probably 250 spruce and balsam trees with each day's run. Coupled with the lumbering industry the pulp and paper industry had shown the old time phrase of "exhaustless forests" to be nothing short of undiluted moonshine. These industries in the eastern states and Canada were now coming forward with schemes which approximated scientific forest management. The day of forest butchery must end or the country ceases to be an international competitor. The history of the lumbering industry has been one of continuous chase of virgin timber supplies from county to county and north to south. President Dodge, of the International Paper Company, recently declared that there were not today two stands of spruce in eastern America that would justify the erection of two fifty-ton pulp mills. In eastern United States the last stand of the great American lumber industry was now being made in the south after stripping Maine, Wisconsin, Michigan and other lake states. The president of the Southern Pine Manufacturers has declared that 3,000 mills under his jurisdiction will go out of business in ten years because of exhausted forests.

Turning to Canada, the speaker showed that the forest resources in the three prairie provinces except for the areas in the forest reserves, are in a state of progressive deterioration; 80 per cent. of the west's original inheritance of splendid forests has been destroyed by forest fires. On the most valuable portions of what now remains, said the speaker, the methods of commercial operating under sanction of the Dominion government were leaving the forest properties continually poor. Mr. Black declared that few, if any, lumbermen and pulp company executives in eastern America were any longer deluded by the old fiction that unregulated logging at present in vogue throughout the Dominion will do anything but destroy the capital values of our timber area. European practice now centuries old which looked upon a timber tract as a source of permanent timber crops was now being adapted to American and Canadian conditions. As far as the three western provinces are concerned, this calls emphatically for the handling of the public-owned timber berths of over 6,000 square miles by the Dominion forestry branch, which is the government's only technically qualified department. The United States government has had its entire area of national forests lands under strict regulation by the U. S. Forest Service for many years past and with uniformly satisfactory results to the American people and the commercial operator.

The speaker made clear that in the truest sense the most valuable and indispensable timber areas in the prairie provinces are not "alienated" as people commonly suppose. The Dominion government representing the interests of the west, is absolute master of the methods of handling such timber berths and can at any time establish on these areas such constructive forestry practice as is in the true interests of the community. Mr. Black explained that the quarrel as to the ownership of the forest resources in the west was not the conservationist's business, his only concern is to see that no matter who owns the western forests they are administered in the interests of the greatest number of people over longest possible period of time. In any event, ownership of the prairie province forests does not constitute an immediate financial asset, looked at from the point of view of relieving other forms of taxation. The Dominion

government spends more than 200 thousand dollars annually on the Western forests for protection and administration over and above what comes to the federal treasury as revenues.

"Forest is state business. A corner grocery, a broker, a farmer, follow the individualist's law of business, by which for a given investment he expects and must have a fairly immediate return. This natural factor removes the practice of forestry from the sphere of private effort because the forest is a long time proposition maturing its crops only in cycles of 60 to 100 years. Forestry therefore is community insurance for the community has a vastly more considerable interest in perpetuating the forest estate than has the commercial timber land operator. Only the state with its self-perpetuating life can afford to enter upon a policy that will ensure the continuance to posterity of the public-owned forest inheritance."

When Lumbermen Get on the Job

In the recent Navy League campaign, when over \$150,000 was raised in Toronto, the wholesale lumbermen played an important part in the canvass and also subscribed liberally to the fund. A. E. Clark was captain of the team, which consisted of about fifteen representatives of various firms. The block bounded by Yonge St. on the west, Toronto St. on the east, King St. on the south and Adelaide St. on the north was taken over entirely by the lumbermen who conducted their work thoroughly and met on the whole with a generous response. The members devoted three days to the subscription campaign and their labors were highly praised by the central committee.

The lumbermen's team collected in the neighborhood of \$10,000 and the following constituted the members of the canvassing committee: Messrs. Wilson, (Canadian General Lumber Co.); George, (R. Laidlaw Lumber Co.); Hardy, (Union Lumber Co.); Spragge, (Victoria Harbor Lumber Co.); Findlay, (Long Lumber Co.); Greene, (Terry & Gordon); Howes, (Campbell, Welsh & Paynes); J. R. Carter, (Fesserton Timber Co.); Barclay, (Canadian Western Lumber Co.); Lamont, (C. G. Anderson Lumber Co.); Alex Read, (Read Bros.); Armstrong, (Seaman, Kent Co.); Jarvis, (Elgie & Jarvis Co.); A. C. Gordon, (Edward Clark & Sons). The captain, A. E. Clark, has written a letter of thanks to each of the firms represented, expressing his gratification at the active work done by them individually and collectively.

Hardwood Limits and Plant Change Hands

The Jones-Webster Corporation of Wenlock, Vermont, in which Edward Clark & Sons, of Toronto, have a controlling interest, have disposed of their saw-mill, logging equipment and timber-cutting rights on 70,000 acres of limits to the Warner Sugar Refining Co., Wall St., New York. It is the intention of the purchasers to continue operating the sawmill and to erect a large stave plant at Wenlock for the manufacture of their own barrels. The sawmill has a cutting capacity of 30,000 ft. a day and the timber of the holdings consist principally of birch and maple. The Jones-Webster Corporation retain the present stock of lumber and will finish cutting this year's allotment of logs in about six weeks. They have on hand some 4,000,000 ft. of lumber, which has practically all been sold, but has yet to be shipped out. Edward Clark & Sons will still maintain their selling organization in the Eastern states and will devote their attention more exclusively to the wholesale line. They have been engaged in the manufacturing end in Vermont for about two years.

Good Market for Maple Flooring

J. Forsyth Smith, Trade Commissioner, Liverpool, sends an interesting report to the Department of Trades and Commerce at Ottawa in regard to the market for maple flooring in England. He says that the general outlook for this commodity at the present time is excellent, as there is a good demand, and with the large amount of building in prospect, this should steadily increase, as industrial conditions become more settled. The sizes most in demand are 1-inch and 1½-inch by 4-inch and 4½-inch. Wholesale prices at various dates during the past few years have been as follows:

December 31, 1917,	30 to 40 per standard
June 1, 1918,	35 to 45 per standard
December 31, 1918,	35 to 45 per standard
February 1, 1919,	30 to 37 10s. per standard
May 1, 1919,	25 to 35 per standard
August 1, 1919,	55 to 65 per standard
September 1, 1919,	55 to 65 per standard

Forest Fires Sweep Valuable Timber

A bush fire, about seven miles west of Fernie, did damage to the estimated extent of \$5,000 to A. J. Farquharson, cedar dealer, operating a camp in that locality. Between 12,000 and 15,000 manufactured cedar fence posts were destroyed, also a large quantity of mining props and poles, together with bush equipment, chutes, roads and landings. The limits were also badly fire-swept. Mr. Farquharson managed to save his camps, which are located on the opposite side of the railway, from the fire.

It is very exceptional at this season of the year for fires to be considered dangerous, but the past season has been the most disastrous in the history of this district. Millions upon millions of feet of merchantable standing timber have been swept over by fire, and huge quantities of the same fire-killed, which unless logged and manufactured within a short time, will be a total loss. The rain precipitation this season has been practically nil, and consequently the condition in the woods is exceedingly favorable to fires rapidly spreading once they have started.

Many Hungry Souls With But Single Thought

There is nothing like the open air to give one a healthy, keen appetite, and the accompanying picture shows a boat-load of hungry sorters at the dinner-shack. The picture was taken some time ago at the sorting camp of the Laurentide Co., Grand Mere, Que., and the scow is seen approaching the dock. One can almost picture the effectiveness of the attack of the boys upon a ton or two of pork and beans, as determination is written in every lineament of their countenances. Some of the expectant ones seem to have visions of an unusually good meal, for the company is particularly happy, and after a busy morning's work no five o'clock tea morsels are required to tempt their voracious appetites. After the fray is over, one can picture the outcome as something in the nature of a massacre. The Laurentide boys are, to use a terse term, good feeders, and, incidentally, good workers. The camps of the Laurentide Co. are well managed, and the town of Grand Mere is a model one in many respects, with every modern convenience and facility for education, relaxation, entertainment or healthy sport.

New Company Has Big Plans Ahead

As stated recently a federal charter has been granted to Lumber and Pulpwood of British Columbia, Limited, with a capital stock of \$1,000,000, and headquarters at 120 Bay St., Toronto. The officers of the company are: President, Joseph Oliver (Oliver Lumber Co.), Toronto; Vice-President, E. V. Tillson, (The Tillson Co.), Tillsonburg; Sec.-Treas., John W. Gordon, 120 Bay St., Toronto; Directors, James A. Thomson, (Gartshore-Thomson Co.), Hamilton; George C. Goodfellow, (Wholesale Lumber), Montreal.

The distribution of the products in Ontario will be taken care of by the Oliver Lumber Co. of Toronto, who have been over forty years in business, while the requirements of the Maritime Provinces and Quebec will be looked after by George C. Goodfellow, wholesale lumberman of Montreal, who has five lumber yards in that city.

The company have been incorporated for the purpose of manufacturing lumber and cutting pulpwood from the valuable timber limits secured in 1908 at a low cost by the Willow River Timber Co., which was organized as strictly a timber holding and not a lumber manufacturing company. The limits are situated on the watershed of Ahbau Lake and Willow River, Caribou District, B.C., and consist of forty-nine square miles of standing timber. It is estimated that the limits will produce over 500,000,000 feet, board measure, of good, general-purpose lumber, and 250,000 cords of the finest pulpwood. About 80 per cent. of the timber is white spruce, 10 per cent. white or balsam fir, with a small stand of red fir. The company propose to erect a complete sawmill plant with a capacity of 100,000 feet in ten hours, and to install the most up-to-date machinery.

In regard to pulpwood, the company state that this industry is merely in its infancy in the Pacific Coast Province, and they point out that one ton of B. C. spruce will produce 2305 lbs. of ground pulpwood. The company add that should it be considered desirable when conditions warrant, the organization will be recapitalized or a subsidiary company formed to manufacture both pulp and paper, and if a sulphite mill were erected, all edging, slabs and other mill waste could be utilized.

An Attractive Business Calendar

The E. Long Manufacturing Co. of Orillia, Ont., have issued a large and decidedly attractive calendar, which is one of the finest productions in that line. Upon a buff background is shown a bird's-eye view of the company's large factories, and at the foot of each sheet are seen splendid cuts of the representative lines made by this enterprising firm. These include log jacks, log deck equipment, portable sawmills, semi-portable and heavy duty mills, saw frames, edgers, Pacific Coast mill equipment, saw mill repairs and supplies, lath machines, lath bolters and other information. The whole calendar is a work of art and beauty and contains much useful and valuable information.

More Power for Bathurst Lumber Co.

Plans have been prepared for a hydro-electric power development at Grand Falls, on the Nepisiguit River, for supplying power to the Bathurst Lumber Co., Bathurst, N.B., in connection with their lumber mills and pulp plant. The current will be transmitted over a transmission line, with steel piles, to Bathurst, a distance of 19 miles. Two units will be installed, provision being made for

Laurentide workers arriving at sorting camp for noon-day meal

a third unit. Each unit will be 4,500 h.p. The turbines will be of the vertical, umbrella type, direct connected to generators, and will work under a head of 100 feet. The dam and power-house—the former 450 feet long—will be constructed of concrete. Mr. William Kennedy, Jr., of Montreal, is the hydraulic engineer, and Dr. L. A. Herdt, Montreal, the electrical engineer.

Wooden Shipbuilding Under Community Plan

Continuance of the wooden shipbuilding industry on the Pacific coast depends on the success of a scheme for community building and operation. The last of the twenty wooden cargo carriers built by the Foundation Company for the French government has been launched, and unless further business is forthcoming from another direction the industry will have ceased. The work of outfitting the hulls is being proceeded with at present. Several hundreds of workmen employed at the Point Ellice and Point Hope yards have been paid off. The last launching took place at Point Ellice, B. C., on October 10. This marked the completion of the largest shipbuilding contract ever awarded in British Columbia.

The plan of building wooden vessels under a community plan has received the endorsement of the Foundation Company, according to an announcement by Bayly Hipkins, vice-president and Pacific Coast manager of the company, after a conference in New York, with the directors of his company. Definite plans have not yet been made public. The company is understood to be willing to assist in financing the scheme by purchasing stock and by contributing its plant and organization to Victoria. The management points to the urgent need for tonnage and the high freight rates which show no sign of diminishing in the near future. The vessels will pay for themselves in a comparatively short time, company officials state and will help to transport British Columbia products to overseas markets. The building of four wooden vessels at a cost of \$500,000 each has been proposed, involving the raising of funds to the extent of \$2,000,000.

The death of Frank Skinner White occurred recently in St. John. He was a highly esteemed citizen and a popular business man. Mr. White was manager and a member of the firm of W. Malcolm Mackay Ltd., lumber merchants, and was well known throughout the country. He is survived by his wife and one son.

The Passing of Pioneer Lumberman

John Headhead, who recently passed away at Lowville, Ont., was a widely known lumberman and actively connected with the industry up to his death. He was born in Peterboro in 1835 and, when twelve years of age, started rafting down the Trent Canal, and then on the St. Lawrence river to Quebec, which work he continued for some years. Later he followed millwrighting and started operating plants of his own, sawing by the thousand feet at Stone Bridge on the Welland Canal, Ancaster, Carlisle, Freelon and other places. In 1868 he purchased from James Hadden, another pioneer, a lbock of timber in Nelson township, Halton County, where he operated continuously till his death, cutting several large stocks. He had no less than four sawmills burned, the last one when he was nearing his 70th year, but his courage never failed and he quickly set about rebuilding. He still owned a mill at the time of his death which he ran last Spring for several weeks, doing all his own saw-filing and setting. The late Mr. Readhead was for several years a member of the municipal council and held other public positions. Walter Readhead, of Milton, a director of the Canadian Hereford Breeders' Association, in which the late Mr. Readhead also took much interest, is a son of the deceased, who was well known in Halton, Wentworth, and Welland counties, where he enjoyed a wide measure of esteem.

How Canada's Lumber May Reach Foreign Ports

This is a picture showing Benson log rafts moored at San Diego Harbor after a journey of 1,200 miles by ocean from the Columbia River. It affords a good idea of how Canada's timber may reach foreign ports in future, thereby ameliorating the shipping problem. The cut is kindly loaned to the "Canada Lumberman" through the courtesy of the Intelligence Branch of the Department of Trade & Commerce, Ottawa, and affords some conception how rapidly transportation systems, and means are changing to meet present-day requirements regarding bulk, service and delivery. In connection with the numerous big rafts now seen on the Pacific Coast it may be stated that the first Davis rafts of cut lumber that entered Vancouver harbor were recently at the government wharf awaiting shipment east. The tugboat Contli made the long haul from Masset Inlet to Vancouver without incident. There are 2,500,000 feet in the two big rafts, which draw fourteen feet. This lumber was cut at the Masset Timber Company's mills at Buckley, on Masset Inlet. It consists of spruce lumber, part of the production of the war-time airplane spruce campaign. The Masset Company bought it from the Imperial Munitions Board.

Help is Scarce in the North

F. E. Hawkes, who operates a saw and planing mill at South Gillies, Ont., in the Thunder Bay District, reports that during the past season he cut about ,0000 feet per day. The timber was mostly small, consisting of balsam and spruce. His cut during the past summer was around 300,000 feet. Mr. Hawkes says that he finds labor the hardest problem to deal with and it is difficult at times to get sufficient help. He does a lot of custom work for farmers and others, in both sawing and planing, but does not operate any camps, buying most of his logs from outsiders. Lumber is ruling high in the Port Arthur district at the present time, and the prospects are exceedingly good for next season's activities.

Timber Operations Extending in England

A new organization for the development of Canadian export trade has been launched in London in the formation of Shawinigan, Ltd. The corporation which is financed by Montreal and English interests, has as chairman and managing director H. T. Meldrum of Montreal. The vice-chairman is S. Ray Marshall of London, and the directors are: Edmond J. Boake, London, John Dawbarn, Liverpool, and Howard Murray, Montreal. It will deal in the products of the greatest electro-chemical centre in the Empire, Shawinigan Falls. They will have the sole right to sell products in the United Kingdom and Europe.

Timber Operators & Contractors, which was formed in Britain by demobilized officers and men of the Canadian Forestry Corps, at present are logging and sawing at seven different British centres, and are launching out into Siberia and Europe, as well as acting as British agents for Canadian timber firms. They have acquired one of the best re-saw plants in the United Kingdom, the Priddy and Hale plant, at Rotherhithe, Surrey docks, are erecting a creosoting plant, and will build a sash and door factory. The firm is capitalized at \$2,500,000 and is headed by Major-General Alexander McDougall, former general officer commanding the Canadian Forestry Corps.

Pembroke Sawmills Have Busy Season

Pembroke is one of the busy town in Eastern Ontario and has long been a prosperous and thriving community. As a lumber centre it is well known and possesses two large concerns, both of which have had a good season. These are the Pembroke Lumber Co., Limited, and the Colonial Lumber Co., Limited, the products of which are shipped to many points. The output of these two companies is about 40 million feet annually.

The Pembroke Lumber Company, which has been one of the town's leading industries for over 25 years, was founded by the Hon. Peter White, Mr. A. T. White, Arunah Dunlop, Cornelius Chapman, Thomas Deacon and John Bromley, and has always been a going concern. It has increased its plant from time to time.

At present the Company employs about 250 men in its mills, and manufactures about 20,000,000 feet of lumber per year. Besides its ordinary log cutting equipment it operates a lath and picket mill, its planing being done by the recently erected planing mill of Mr. L. S. Barrand. The company is operating six logging camps this year with a staff of about six hundred men. Two of these camps are on the Big Jocko river, two on the Little Jocko, one near Kenny's Siding and another near Diver on the C. N. R.. The officers of the company are President, Mr. E. A. Dunlop; Treasurer, Dr. J. D. Deacon, and Manager, Mr. Arthur Eastcott.

The Colonial Lumber Company, which was originally founded by Messrs. Robert Booth, Robert Gordon, E. F. and G. F. Faquier.

Transportation of Canadian timber by log rafts

E. J. Chamberlin, and J. W. Smith, about twelve years ago, these gentlemen taking over the plant of Messrs. A. and P. White, has prospered exceedingly. The Colonial Lumber Company suffered a number of reverses through fire, but even that did not impede its progress, and to-day its plant is up-to-date in every respect. It employs about 250 men about its mills, and some 600 in its logging camps, seven of which it is operating this year, two on the Kippewa River, three on the Deux Rivieres, and two on Deep River. Its average yearly output is about 20,000,000 feet, while it operates both a lath and picket mill. The officers of the Company are: President, Mr. E. J. Chamberlin; Vice-President, Mr. J. W. Smith; and Secretary-Treasurer, W. R. Beatty, Mayor of Pembroke.

Eastern Concern is Rushing Business

The Davison Lumber & Manufacturing Co., of Bridgewater, N. S., say that during the past summer they have found market conditions better than they have been for many years. Both the local and export demand for lumber was exceptionally good and the selling prices allowed of a respectable margin of profit. The sales of the company were limited by their output, which, for the past two years, has been only about 50 per cent. of normal, but they are making preparations to log to normal capacity this winter. While at present the labor to do this does not appear available locally, they hope to find sufficient help through the medium of labor bureaus and by other means.

The Davison Lumber & Manufacturing Company report that the demand for hardwood flooring is decidedly active, and they are booked up for, at least, three months ahead to the full capacity of their mill, and the same observation may be made with regard to box shooks. For several months their planing mill, box factory and hardwood flooring departments have been working time and a half. Between the company's mills at Bridgewater, Springfield and Mill Village, the Davison organization hope to have available for next season's cutting about 40,000,000 feet spruce, pine, hemlock and hardwood. The lumber market for next year appears promising and good hopes are held out for its stability if operators will come up to the demand and not-adopt the old idea of "any old price but we must have the order."

Conserve Natural Growth of Timber

How New Brunswick Is Perfecting Forestry Service and Keeping Tab on Annual Cut on Crown Lands

G. H. Prince, Fredericton, N.B.

Mr. G. H. Prince, chief forester of New Brunswick, recently read an instructive and timely paper on "Forestry in New Brunswick," before the Engineering Institute of Canada, which met in St. John. Mr. Prince dealt with his subject from many standpoints, and covered the ground thoroughly. He said in part:

The present marked development in forest administration in New Brunswick may be traced largely to a Canadian Forestry convention, held in Fredericton just twelve years ago. At that important gathering of practical and scientific men the many problems of Forestry, including proper utilization, fire protection and Forest Conservation were fully discussed, and many far-reaching resolutions were presented to the

Government. The most important and immediate result of that convention was the establishment of a four years' course in Forestry in the University of New Brunswick in the following year.

In all, twenty-nine foresters have since graduated from this university, a small number you will say, but well worth the effort when you consider the great part they have taken, and are taking, in the development of forest conservation in all parts of Canada.

Before attempting to describe what the Provincial Government has done, let us consider the progress of forestry with owners of crown granted forest land. One company owning over one and one-half million acres of forest land in New Brunswick early started the surveying and cruising of their limits. This forest survey, a task that took over five years, furnished the company with accurate timber maps, timber estimates, reports on the conditions and growth of the timber, etc. This information has had much to do with shaping this company's policy in regard to the disposal of its timber towards an increased income and a perpetual supply. Quite extensive surveys have also been made by two other large owners of private lands in New Brunswick.

Survey of Provincial Forests

The government of New Brunswick, no doubt realizing, as the private companies have done, that the best results in the management of its greatest resource, the forest, could not be obtained without a full knowledge of that asset, passed the Act which provided for the forest survey and classification of the seven and one-half million acres of public forest lands. This survey, commenced in 1916, has been continued as rapidly as possible, consistent with war conditions, and already over one-quarter of the total area has been surveyed and mapped, at a cost of approximately five cents per acre.

The objects of this forest survey, as defined by the Act, are, briefly:

First—To report with as much detail as possible upon the character and quantity of the lumber, estimating the quantity of timber and the reproducing capacity of the forest.

Second—To estimate as accurately as possible the annual growth of timber upon each area or tract. That is, the number of board feet produced each year.

Third—To report upon the accessibility of the timber on each section, estimating cost of logging on the different areas and cost of driving.

Fourth—To report the location of lands deemed suitable for agriculture, distinguishing them from other lands that might be regarded as suitable for the growth of timber only.

In order to obtain the above information the most modern and scientific methods of timber estimating and mapping have been employed, and this survey is said to be the most extensive of any survey of its kind in regards to areas in North America. The method of carrying out the above work is technically known as the strip method.

Correct Return of Logs Cut

One of the main duties of the forest service is to secure a correct return of the logs cut from crown lands, and when it is stated that usually there are 700 or 800 camps and the cut exceeds 200 millions and 500,000 ties, it is seen that it is considerable of a task.

Each ranger is furnished with complete plans of the crown land in the district assigned to him, and he is held responsible for the

proper count, scale and return of all material cut from these lands each year. He is furnished with an assistant or counter, who assists him during the scaling season. About 5,000,000 feet is considered sufficient work for any scaler. Each camp is visited every two weeks and the yards of logs counted and scaled, marked and numbered. A report is furnished the Crown Land Office every two weeks on the logs scaled and counted at each of the 700 or 800 camps in operation. This report is checked and a duplicate mailed at once to the licensees, so that he is properly informed of any infractions of cutting regulations, such as cutting undersized timber, too high stumps. If the licensee disputes the scale the logs are still there and a check scaler is put on and the dispute immediately settled. This system, tried out last season, has given very satisfactory results, and will be in use again this year, with only slight modifications.

Beck Company Buys Little Current Mills

The C. Beck Mfg. Co., Limited, of Penetanguishene, Ont., who operate two saw mills as well as extensive woodworking plants in that town, have purchased the mills and timber of the Little Current Lumber Co., Little Current, in the Algoma district of Ontario. The Beck Co. are now operating their camps.

The Little Current Lumber Company's mill is built upon solid rock, which resulted in securing for its machinery its excellent smoothness of operation. The machinery of the sawmill consists of a double-cutting band saw and a gang-saw in addition to the full equipment of edgers, trimmers, etc. The capacity of the plant is about 140,000 ft. in twenty hours when the mill is operated night and day. The plant of the Little Current Lumber Co. was formerly owned by W & A. McArthur, Cheboygan, Mich., and it was taken over by Mr. Geo. T. Jackson (then interested in that company), along with the others. There is a well-equipped lath department, and the number of men employed in the plant is from 150 to 200.

What the conditions will be during the coming season the Beck Co. say that it is difficult to determine at present owing to the unsteadiness of labor. Men are going out from the camps now faster than they can be put in and the situation is most discouraging and unsatisfactory. Those who shift at short notice or no notice at all, are mostly foreigners and by their frequent migrations not only interrupt business but cause an enormous amount of trouble and loss both of time and money to the lumbermen. It was thought when the war was over that conditions would settle down somewhat but the "travelers" from one camp to another appear to be as numerous as ever.

Will Use Both Wood and Concrete

A recent despatch from London, Eng., says: The Ministry of Health announces that with a view of securing more rapid erection of houses, it is negotiating with a number of firms for the erection of buildings of other materials than brick or stone. These materials will include wood, reinforced concrete and asbestos sheeting, as well as interlocking and hollow terra cotta bricks. Messrs. Boulton and Hall are prepared to erect a large number of one-storey wooden bungalows on a plan approved by the Ministry of Health. The approximate cost of each bungalow is to be about \$3,000. This firm has stated that it hopes to build about a thousand of these houses each year.

Lumber Piled High Awaits Shipment

While the winter port season draws near the problem of lumber merchants in New Brunswick becomes more involved for they have still many millions of feet of lumber belonging to the British government piled high in their yards and on every available space near their mills. In addition, they have the vast majority of this year's cut on hand, and the question which is causing them no small concern is where they are going to find room for it all. Some of the mills have runs a long distance for their mills, and the pilers have to carry the deals etc., three and four times as far as would be necessary if that already sold was disposed of. With the approach of the winter port season the chances of getting cargo space become more remote, and the real problem will be in the spring. The merchants are making every effort to better conditions and are hoping against hope that steamers will be released to carry away the supply, which has been left too long on their hands.

Rafting operations at the Douglas booms, Fredericton, which had been suspended for some time on account of lack of water, have been resumed. Between one and two million feet of lumber were at the booms. The corporation drive at Grand Falls, N.B., was estimated to be about two million feet, but by the time it reached Bristol it was said to be four million feet. The St. John River Log Driving Company were all through their sorting at Van Buran, early in July, but their logs were held up there by lack of water.

The Forestry Corps Knew No Failure

Only Now is Magnitude of Task Performed by Sturdy
Canadians Being Fully Appreciated

The Canadian Government was asked by the Imperial authorities to supply, if possible, fifteen hundred men for lumbering operations in Britain. This was in February, 1916, after the war had been going on a year and a half. The conditions under which the war was being waged had created an enormous and ever-increasing demand for timber for use in a great variety of ways. It was required in the construction of the endless lines of trenches, in the walling and roofing of dugouts, in the building of military roads and railways, in the strengthening of wire entanglements, in the building of huts, and in a hundred other ways.

During the first eighteen months of the war an attempt had been made to supply this demand by increased production in Great Britain and by heavy imports from this country. It was found, however, that the movement of this timber drew heavily upon the tonnage, which was urgently needed for the transportation of foodstuffs, munitions, and other essentials. The British Government having decided to rely upon the home timber industry, a practical difficulty presented itself; it was found impossible to procure an adequate supply of the right kind of labor. It was then that an appeal was made to the Canadian Government. Six weeks saw sixteen hundred men of the first Forestry Battalion (the 224th) mobilized at Quebec, drawn from all parts of Canada. This battalion took to England its own equipment, including mills, lorries, etc., valued at a quarter of a million. By May 13th sawn lumber was being produced in England by this battalion.

Of the work done by the Canadian Forestry Corps, much has been said and written, but relatively few people in Canada have anything approaching an adequate conception of the service which this corps rendered in the war. The first draft which crossed the ocean under Lieut.-Col. Alexander McDougall (now Major-General McDougall, C.B.), was followed by a steady stream of foresters. The initial experiment, if it can be so called, was successful from the beginning. The work of the first battalion revealed the possibilities of more extended operations, and the Canadian Forestry Corps came into being. The Canadian lumbermen, as has been stated, took with them their own mills and machinery. What was equally, or more important, they took with them their own methods, and they worked under the direction of officers who understood thoroughly the business of lumbering. Beginning with the forests of the south of England, the operations of the Corps were soon extended across the Channel into France, and northward into the Highlands of Scotland. Major-General McDougall, who became the Director-General of Timber Operations in Great Britain and France, provided at an early stage for a great expansion of the service by the advance purchase of equipment sufficient for a force of ten thousand men. The wisdom of this step was fully demonstrated by subsequent events. It meant a great saving of time during a period when time was everything. The working conditions in Britain differed radically from those prevailing in Canada, but the Canadian machinery was adapted to these conditions with very little change, and, under the direction of practical lumbermen, Colonel Gerald V. White, C. B. E., in Great Britain, and Brigadier-General J. B. White, D. S. O., in France, the field operations of the corps were conducted upon a scale of production which was a revelation to the governments and people of both France and England.

One example of this will serve as an illustration. In February of 1918, when important events were anticipated on the western front, an emergency call was made for forty thousand tons of timber to be sent to the front. The mills were running day and night, the men voluntarily working for long hours, without extra pay or other inducement, and by the tenth of February shipments had commenced. By March 20 the whole order had been filled, eleven days before the expiration of the time set.

The work of the Canadian Forestry Corps is deserving of a specially written history, and it is satisfactory to learn that something has been done in that direction by the publication of a book entitled "The Canadian Forestry Corps, Its Inception, Development and Achievements." The work has been prepared at the request of Sir Albert Stanley, the President of the Board of Trade, and is written by Mr. C. W. Bird, of the Timber Supply Department, and Lieutenant J. B. Davies, of the Forestry Corps. What is contained in this book conveys a much better idea of the magnitude of the task performed than could be gathered from previous contributions dealing only with special phases. It pays to the Corps and its officers no tribute which they do not well deserve.

Timber Wealth of Western Canada

Timber has always played an important part in assisting in the development of new countries. This is particularly true of the prairie portions of Western America, where the first need of every settler is lumber. In this particular, nature has been exceptionally kind to the four Western provinces of Canada, for while the prairie provinces of Manitoba, Saskatchewan and Alberta produce a certain amount of lumber, the lumber needs of the prairie districts of these provinces could not be filled were it not for the vast timbered areas of the province of British Columbia. This province differs from its three sister provinces to the east in that it is more or less mountainous throughout, and only in the valleys is there opportunity offered for agriculture, horticulture, and animal industry, but the province possesses one of the great undeveloped timber areas of the world. Conservative estimates indicate that the commercial standing timber in the province of British Columbia amounts to 366,000,000,000 feet. This timber comprises cedar, Douglas fir, spruce, hemlock, white fir, lodgepole pine, western yellow pine, yellow cypress, western larch, western white pine and cottonwood.

This vast timbered area has already been developed to a certain extent through the medium of sawmills and allied woodworking industries, but the extension of this portion of our industrial activity will offer opportunities for a further investment of capital coincident with our extension of agricultural settlement east of the mountains and of our overseas export lumber business. There would also seem to be an opening for the extension of our wood pulp and paper making industry in view of the vast quantities of suitable pulpwood to be found in all these four Western Provinces, and in this connection it is noted that we must endeavor to correct the situation which occurred last year in which Canada exported pulpwood to the value of \$15,000,000, whereas this pulpwood manufactured into paper at home, at the then existing prices, would have realized the sum of \$79,000,000.—Col. J. S. Dennis, Chief Commissioner, Department of Development, C. P. R., before recent Alberta Industrial Congress at Calgary.

The Safety Speed of Circular Saws

The National Safety Council recommends the speed of circular saws corresponding to rim velocity of 9425 feet per minute.

Diam. of Circular Saw	R. P. M.
12 inch	3,000
14 inch	2,570
16 inch	2,245
18 inch	2,000
20 inch	1,800
22 inch	1,635
24 inch	1,500
26 inch	1,385
28 inch	1,285
30 inch	1,200
32 inch	1,120
34 inch	1,055
36 inch	1,000
60 inch	600
72 inch	500

Some manufacturers recommend somewhat higher speeds than here given; however, more than a 20 per-cent. increase is inadvisable.

Band saws are operated at speeds of from 3,500 to 8,000 feet per minute, the heavier saws running at the higher speeds.

Grinding of Wood from Young and Old Trees

Green or freshly cut wood is known to yield a more desirable ground wood pulp than seasoned wood. It is not unnatural to assume, therefore, that a similar difference might occur in the grinding of wood from very small trees which contain a large proportion of heartwood, and smaller trees of the same species. This assumption has been verified by the Forest Products Laboratory, at Madison, Wis.; in a series of commercial grinding experiments on wood from large and small white fir (*Abies concolor*), grown in Plumas County, California. Paper was afterwards made from the pulp on the laboratory machine, and tested for strength and color.

The small or young wood was cut from trees 18 inches or less in diameter, and the large or old wood was split from a single tree 40 inches in diameter and 130 feet high. Under like grinding conditions, the actual solid volume of old wood ground was, in every instance, appreciably less than the volume of young wood ground in the same time.

In brief, the tests demonstrate that (1) there is a considerable difference in the quality of pulp produced from white fir, depending upon whether the wood is taken from old or from young trees, and (2) the advantages as regard production, power consumption, strength, and color are all in favor of young wood.

J. A. Mathieu, Rainy River,
Returned in recent Ontario elections in
Conservative interests

John Carew, South Victoria,
late Conservative Member, who did not seek
re-election

Chas. M. Bowman, West Bruce,
Veteran Liberal representative, who recently
retired

W. D. Cargill, South Bruce,
who put up strong fight but lost
the battle

Lumbermen Candidates are Defeated

Only Two Were Returned at the Polls in the Recent Ontario Campaign—Mageau and Mathieu Win

In the recent Ontario elections the lumbermen legislators did not fare very well at the polls and went down in the general upheaval. There were ten members identified with the industry who sat in the last provincial parliament—four Liberals and six Conservatives. The Liberals were Charles M. Bowman, West Bruce; Zotique Mageau, Sturgeon Falls; Udney Richardson, East Wellington; George C. Hurdman, Ottawa West. The Conservatives were John Carew, South Victoria; W. D. Cargill, South Bruce; Edward A. Dunlop, North Renfrew; James I. Hartt, East Simcoe; James A. Mathieu, Rainy River; James Thompson, East Peterborough.

All of the foregoing sought re-election with the exception of Charles M. Bowman and John Carew, who withdrew from political life. This left eight lumbermen legislators in the field and in addition there were three other lumbermen who sought parliamentary honors in the persons of R. S. Potter, of Matheson, who ran in the Liberal interests in Cochrane, R. E. Butler, of Woodstock, who contested North Oxford in the Conservative cause and James G. Cane, of Toronto, who was the Liberal standard bearer for seat "A" in Northwest Toronto. This made eleven lumbermen who went to the polls, five in the Liberal interests and six in the Conservative ranks. The late Sir John A. Macdonald once remarked that there was nothing quite so uncertain in this life as a horse race or an election. Out of the eleven lumbermen contestants, only two were returned by the people. They were Zotique Mageau, Liberal, Sturgeon Falls and James A. Mathieu, Conservative, Rainy River.

Mr. Richardson was defeated by a United Farmer candidate in East Wellington; George C. Hurdman by a Conservative in Ottawa West; W. D. Cargill by a Liberal in South Bruce; James I. Hartt by an Independent Liberal in East Simcoe; James Thompson by a United Farmer in East Peterborough; R. S. Potter, by a Liberal in Cochrane; R. E. Butler by a United Farmer in North Oxford; J. G. Cane by a Conservative in Northwest Toronto, and Edward A. Dunlop by a United Farmer in North Renfrew.

There will thus be only two lumbermen legislators in the new House, one Conservative, Mr. Mathieu of Rainy River, and one Liberal, Mr. Mageau of Sturgeon Falls.

J. A. Mathieu was re-elected for Rainy River in the Conservative interests and has been a member of the Ontario house for the past seven years. He spent a long period in the lumber arena in Wisconsin and Minnesota and knows the business in all departments. He is a public-spirited and enterprising citizen and is vice-president of the Shevlin-Clark Lumber Co. and also vice-president and director of the Shevlin-Mathieu Lumber Co., as well as manager of other concerns. He has resided in Rainy River for the past seventeen years.

W. D. Cargill, who was defeated in the recent election as the Conservative standard bearer for South Bruce, has been a member of the Ontario Legislature since 1914 and his father represented East Bruce in the House of Commons for several years. Mr. Cargill is president of Cargill's Ltd., who operate a large woodworking

plant, and also is a director of the Hepworth Mfg. Co., Hepworth, Ont., and president of several other organizations. Previous to becoming a member of the Ontario Legislature, he contested South Bruce in the Conservative interests for the Federal house in 1913.

John Carew, who was not a candidate in the present election, having retired on his own account, is a progressive lumberman from Lindsay and his withdrawal from the political arena will be much regretted by many friends. Mr. Carew was first elected to the Ontario Legislature in 1914 in the Conservative interests as a representative of South Victoria. He was well liked on both sides of the House. Not only does Mr. Carew conduct a busy sawmill at Lindsay but he also runs a planing mill and retail lumber yard. He has always taken a deep interest in the advancement of the town and is a useful and progressive citizen.

Chas. M. Bowman of West Bruce is another member of the late House who did not seek re-election. He had been Liberal whip for the past sixteen years and will be greatly missed by many old friends. He came through six elections without a defeat, which is a unique record. Mr. Bowman is actively engaged in several woodworking industries and was for a number of years president of the Southampton Lumber Co., Ltd., operating in the Bruce Peninsula for ten years. He has always taken an active interest in the development of Southampton where he is a director of a number of live, go-ahead concerns not only in that town but in Port Elgin and Durham. He is a former president of Southampton Board of Trade and a former reeve of that town.

References to the careers of other Ontario lumbermen legislators who were members of the late House have been made in the last two issues of the "Canada Lumberman."

Eastern Lumber Plant Changes Hands

The Brompton Lumber & Mfg. Co., Bromptonville, Que., has purchased the plant of the Tobin Mfg. Co., and will operate the same in all its departments, which include wholesale lumber, hardwood flooring, planing mill and woodworking factory. The officers of the company are: President, E. W. Tobin, M.P., Vice-President, P. Alegre, Managing-Director, U. E. Germain; Directors—A. Fournier and J. P. Mullins. It is the intention of the Brompton Lumber & Mfg. Co. to cater to the retail yards in the provinces of Quebec and Ontario, and also to carry a full stock of B. C. fir, which can be shipped mixed with eastern products. The company are very busy at the present time and are having a remarkably good season.

Manitoba Has Small Forest Fires

Manitoba had by far the lowest forest fire losses of the prairie provinces this year largely because of a vigorous enforcement of the system of supervising settlers' fires says the Winnipeg "Free Press." Exactly the same law is in force in Saskatchewan, but was left a dead letter by the provincial authorities, with the result that Saskatchewan lost an incredibly large share of its timber properties. Alberta has not yet taken provincial action in curbing the forest evil, although it belongs the primary responsibility. Alberta's losses in timber have been enormous and the evil effects upon the provincial water supply, for power and irrigation, are among the serious consequences.

A Busy Sawmill in Nipissing District

Denison & Gunter, of Porterville, Ont., expect to operate their sawmill until about the close of the present year and have had a very satisfactory season. They started sawing on June 1st and up to the first week in September has cut over a million and half feet mostly hardwoods. The firm are now trucking logs from the bush. Their mill is located in Sabine township, Nipissing district, on the portion of the Canadian National Railway formerly known as the Central Ontario running from Picton through Prince Edward and Hastings county and terminating at Wallace in the Nipissing district, some four miles north of the northern boundary of Hastings county.

The mill has a double cut band saw put out by the Breeze Deni-

Glimpse of the mill and logs along the track

sion Co., of Newburgh and a cutting capacity of about twenty thousand feet daily in hardwoods on an ordinary run of logs, and is driven by a fifty horsepower engine and boiler carrying only eighty pounds of steam. The boiler is fired entirely by sawdust.

The band wheels of the mill are six feet in diameter and take an eight inch saw, which when properly fitted, cuts a kerf only seven-sixty-fourths of an inch. The saving against an average circular saw, which cuts a kerf of about seventeen sixty-fourths of an inch wide, can be readily seen.

The lumber from the band saw can be cut thinner and still equal the strength of the circular saw inasmuch as the band sawn lumber is smooth and the fibre of the timber not bruised or broken.

Newsy Happenings of Much Interest

J. M. Berry of the Berry Lumber Co., New York City, spent a few days in Toronto recently, calling upon the members of the trade.

A barge carrying 200,000 laths and 616,821 feet of lumber cleared from St. John, October 10th, for Boston. It was shipped by the Pjepsco Company.

C. C. Schreiber, of Sudbury, Ont., who for twelve years was inspector of ties and buyer of construction material for Mackenzie & Mann, has joined the selling staff of the Hocken Lumber Co., Toronto, and has entered upon his new duties.

C. G. Anderson of the C. G. Anderson Lumber Co., Toronto, severely wrenched his right hand while cranking his Reo car, which back fired. He was laid up a few days, but is able to attend to business, although the disabled member is, at times, painful.

A serious fire broke out in Oromocto, N.B., recently and wiped out nearly the entire village as well as the sawmill and lumberyard

of the River Valley Lumber Company, which was the chief industry of the village. R. B. Smith, M.P.P., manager of the company, estimated their loss at \$200,000. The fire was discovered in the saw mill underneath the engine room, and a few minutes later had spread, and the mill was soon a mass of flames. A high westerly wind was blowing at the time and soon the blaze spread to the offices, mill yard and lumber piles. There were four million feet of manufactured lumber in the yard and two cars on the railway siding.

William Robertson, forester for the commission of conservation, was in St. John, recently, while en route to Northumberland County, to make a preliminary examination of Dominion lands on which timber had been destroyed by the spruce bud worm. The utilization of the lumber killed will depend upon the result of his investigations.

Lively Briefs From the East

The Bonny River Lumber Company of St. George will cut two million feet of lumber on the Brine property about Mill Lake this winter. Roscoe Burgess and Matt. McKay have contracted for one million each. The mill now operating in St. George will be moved into the woods and the lumber manufactured there. The company has also put a crew in at Piskegan. Their output will be rafted and towed to St. George for manufacture.

Twenty-two young men, eighteen of whom were returned soldiers, took examinations last week for forest rangers. They were taken to Victoria Mills, near Fredericton, where they were given an examination on scaling. The remainder of the examinations were written in the parliament buildings.

Two schooners, the E. M. Roberts and the Maplefield sailed within the past few days for Barbadoes, lumber laden. The former took away 209,383 feet of lumber and 6,196,001 shingles, while the latter carried 3,405,000 cedar shingles.

The American Consul in St. John gave out the following account of lumber shipments to the United States for the three months ending September 30. The report shows a considerable increase over the corresponding months last year:

Laths	22,962,000	\$96,624.34
Lumber	12,510,000 ft.	416,282.22
Pine boards	82,000 ft.	2,803.00
Pulpwood cords	4,457	62,084.25
Shingles	340,000	2,697.65
Spruce piling	2,492 pcs.	6,665.50
Wood pulp	6,255,000 lbs.	322,667.41
Total		909,824.37
Total for the same period 1918		652,697.97

Returned Men on Field Work

H. S. Laughlin, forester of the J. B. Snowball Co., Limited, Chatham, N. B., in reviewing the summer field activities, says that the work was started June 24th and completed Sept. 15th. 50 sq. miles was surveyed into blocks $2\frac{1}{2}$ miles square and cruised. The line work was started with a crew of five men and one crew of four men cruising, but after about three weeks three of the returned men on the party had a return of their disabilities and the party was shortened to six men all doing line work. When the line was finished only one cruising crew of four men was retained. The cost of the work, line and cruise (51) was about \$07 per acre. Of the original party seven were ex-service men.

About 300 M. ft. Birch, Red Oak, Beech and Elm, ready for immediate shipment. Also $\frac{3}{4}$ " Crating Spruce, 1", 2" and 3".

Apply: J. P. ABEL, FORTIN LTD.,
379 Desjardins Avenue,
Maisonneuve, Montreal.
21

For Sale

One "S. A. Wood Matcher 24" fitted with 20 different sizes knives for top and bottom cylinders. Four pairs of heads with six sets of bits. Price \$800, on cars. Savoie & Co., Manseau, Que. 21

Wanted-Machinery

Wanted

Small second hand twin screw alligator with cable. State price and condition. P. & J. Shannon, Biscotasing, Ont. 21

Wanted

1 Pony Double Cut Band, 1 Heavy Edger, 1 Log Jack with chains complete, 10 Live Rollers, Trimmer and Slab Slash. Give description and condition, also prices.

HUBBEL BROS.,
Bancroft, Ont. 21

Double Surfacers Wanted

Yates No. 177 Double Surfacers or other similar machine wanted at once. Sectional rolls, infed rolls, and chip breaker, sectional pressure bar and round cylinders. Must be in first class condition.

Canadian Box & Shook Mills Limited,
Sherbrooke, Que. 21

For Sale-Machinery

For Sale Cheap

One full front 80 H.P. Tubular Steam Boiler, Goldie & McCulloch make. One 65 H.P. Steam Engine, Wheelock's newest type, Goldie & McCulloch make. All as good as new, only used a short time. Move quick for bargain. Apply to Gordon Lumber Co., Stratford, Ont. 21-22

FOR SALE

One Brown type engine, first class condition, 10" x 24" all fittings, ready to set up, 16" x 7" belt wheel.

One Belt, 70' 6" x 44' 3 ply leather endless, scarcely soiled. Two Belts, 60' 6" x 20" double leather, scarcely soiled. Two inserted tooth lumber saws, one 56" practically new, one 52" in good condition. W. H. Cook, Box 356, Orillia, Ont. 21

Band Saw Mill Complete

Waterous 9 ft. Band Mill, Gunshot Feed Carriage, with extra Saws complete.

Filing Equipment

Three Saw Edger, lot of live rolls, Engines, Shafting, Hangers, Pulleys, etc.

All of the above is Waterous equipment in good condition at a bargain.

The Geo. F. Foss Machinery & Supply Co., Limited,
305 St. James Street,
Montreal, Que. 17-t.f.

For Sale

1—17 x 24 Atlas Engine, with 36 in. x 10 ft. flywheel.

3—No. 94 Berlin Matchers, 15 in., fitted with hard steel knives on top and bottom cylinders—one pair shiplap, jointer and flooring heads with bits for each machine.

1—No. 182 Berlin Double Surfacers, 30 in. x 6 in.

1—No. 199 Berlin Buzz Planer.

1—No. 290 Berlin Picket Header.

The Otis Staples Lumber Company, Ltd.,
19-t.f. Wycliffe, B.C.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

YOUNG MAN, experienced in all branches of lumber trade, open for position as sales man or manager of manufacturing plant or yard. Box 52, Canada Lumberman, Toronto. 21-22

OFFICE POSITION WANTED in lumber company. Five years' practical experience. Pay Rolls, Specifications, Bookkeeping, etc., etc. Quebec province preferred. No objection to northern location. Box 39, "Canada Lumberman," Toronto. 21

WANTED EMPLOYMENT—By practical Lumberman capable of organizing and taking full charge of lumbering operations, no matter how large. Plenty of experience; good references. Box 42, Canada Lumberman, Toronto. 21-22

WANTED OFFICE POSITION by Clerk with good experience in lumber office work. Bookkeeping, etc., general assistant to manager; or charge of small office. Preferably North Shore, or Gaspé coast in Quebec province. References from former employers. H., Box 41, Canada Lumberman, Toronto. 21

SCOTCHMAN, 29 years of age, wishes position in lumber office, any part of Canada or States. Salary \$100 per month and prospects. Has had 15 years office experience, banking 5 years, paper and pulp office 4 years, lumber office 5 years. Has had experience in all branches of lumber office work—accounting, surveying, etc. Inside post wanted. Willing to work to gain good position and can guarantee satisfactory work and trustworthiness; is shorthand typist. Apply Box 48, Canada Lumberman, Toronto. 21

Wanted-Employees

WANTED AT ONCE, fifteen first class construction millwrights. Wire or write the Finger Lumber Co., Ltd., The Pas, Manitoba. 21

WANTED: — PRACTICAL SAW-MILL MAN with portable mill to manufacture hardwood lumber, commencing first of January. Convenient location. Southern Ontario. Bradley Co., Hamilton, Ont. 21

WANTED HARDWOOD INSPECTOR at Montreal, familiar with National Hardwood Lumber Association grading rules. Permanent position at good salary. Must speak French. Box 53, Canadian Lumberman, Toronto. 21-22

POSITION OPEN for a high-class man capable of organizing and assuming full management of all lumbering operations of a 500 mile timber limit for a Company operating a Saw-mill and a Pulp-mill. All replies will be treated confidentially. A permanent position with a good salary open for the right man. Box 993, Canada Lumberman, Toronto. 16-21

JNO. J. GARTSHORE,
58 Front Street W.,
Toronto, Ontario.

20-21

Big Lumber Cut Promised

New Brunswick will this winter have the greatest lumber cut in history, according to all present indications.

The Department of Lands and Mines is preparing for a hitherto unheard of size cut of 250 million feet on the crown lands, and it is believed that the cut on privately owned lands will be equally large.

Shipping is now being made

available for lumber cargoes from New Brunswick to overseas points, and it is estimated that in one week more than twenty-five million feet of manufactured lumber has been shipped by New Brunswick firms across the Atlantic.

Recently when the general strike in the lumber industry on the Miramichi was called every mill with one exception had a steamer in the process of loading. The employees selected the psychological moment for their strike, but leading men in the lumber industry declare that the outlook for profitable operation was never better than to-day despite high prices for labor, supplies, and everything that enters into production of manufactured lumber.

Returns have only just been completed for the last season's lumber operations on the crown lands of New Brunswick, and the figures have furnished some startling surprises. While the estimated cut of 200 million feet was said at the time to be extravagant, even the officials of the department have been surprised to find that complete returns show 210 million feet of lumber actually cut on the crown lands and stumpage charged upon it. Included in this gross amount are some five or six hundred thousand railway ties.

Meanwhile standing timber is being sold at unprecedented prices. One of the biggest deals of this kind closed for some time is just reported from Queen's county, and it is said \$15 per thousand is the price paid for the standing timber. Another case which illustrates the demand for timber is the recent sale by a York county farmer of the wooded part of his farm for \$10,000.

Canada's Shipping Rapidly Expands

The program of ship construction undertaken by the Dominion Government early in 1918 has yielded substantial results. To date, fifteen ships have been delivered, and are already in service under the direction of the Canadian National Railways. There have been 25 sailings, aggregating 116,000 tons of traffic. Voyages have been completed between the Atlantic seaboard and the United Kingdom, and from the Pacific Coast to Great Britain. Thirteen voyages have been completed between Canada and the West Indies and Cuba to South America, and one to Newfoundland. A service is already under way to Australia and New Zealand, and it is possible that the first ship will be available at Vancouver on or about Dec. 1. Additional sailings will be inaugurated in London, Glasgow, Avonmouth and St. John's.

When the present government

ship-building program is completed, 60 vessels will be in service. These will have a dead-weight tonnage of about 325,000 tons.

The Dominion of Canada ships have brought some 35,000 tons of raw sugar from Cuba. A real shortage was averted by the national ships, as no privately-owned ships were available for the service.

McGibbon Sawmill Burned to Ground

The saw-mill of the McGibbon Lumber Co., Limited, was burned to the ground recently at Penetanguishene, Ont. The blaze broke out shortly before noon, and, fanned by a high wind, the mill was soon a mass of flames. The loss is estimated at \$25,000, partly covered by insurance. The mill was equipped with a circular saw and had a cutting capacity of 40,000 ft. per day, the product being white pine, hemlock, hardwood, lath and shingles. The industry was run for many years by the late Chas. McGibbon, and since his death, by his sons. The plant was one of those visited by the Ontario Retail Lumber Dealers' Association on the occasion of their annual outing in July last to the Georgian Bay, and had been very busy during the past season.

Why is Bird's-Eye Maple?

What makes the bird's-eye maple? That is the question which is often asked when a beautiful piece of furniture made of this wood is displayed. There have been a number of theories, but the real reason is simple.

The favorite theory has been that sapsuckers by pecking holes through the bark of young maples make scars which produce the bird's eye figure in the wood during the successive years. Bird-pecked hickory is often cited as an analogous case, yet who ever saw bird's eye figures in hickory, though the bark may have been perforated like a collender by the bills of energetic sapsuckers? Some attribute it to the action of frost, but no such connection between cause and effect has been shown to exist.

The explanation of the phenomenon is simple, and a person can work it out for himself. The bird's-eye figure is produced by casual or abnormal buds which have their origin under the bark of the trunk. The first buds of that kind may develop when the tree is quite small. They are rarely able to force their way through the bark and become branches, but they may live many years just under the bark, growing in length as the trunk increases in size, but seldom appearing on the outside of the bark. If one such bud dies another

will likely rise near it and produce the fantastic growth known as bird's-eye.

It is said the Japanese produce artificial bird's-eye growth in certain trees by inserting buds beneath the bark. The Field Museum, Chicago, has a sample of what is claimed to be artificially produced bird's-eye wood from Japan.

Review of Current Trade Conditions

Ontario and the East

The situation during the past two weeks has not materially changed, and business on the whole is reported good. Now and then one runs across a wholesaler or manufacturer who states that things have dropped off a bit, but, on the other hand, the bulk of the trade are exceptionally well satisfied with what they have been able to accomplish during the past few months. The most striking phase of the whole situation is that the mills are endeavoring to ship out as much lumber as possible in order to have their yards as clear as they can before the snow flies and the usual fall congestion of traffic sets in. The result has been that many retailers have been busy unloading cars, and their stocks, which were low, have been replenished to quite an unexpected extent. This has caused buying to fall off somewhat, but it has not materially altered the general state of affairs. The eyes of the trade are naturally being turned on what will eventuate next year. The mills have advanced white pine \$3.00 per M. on all stuff that is now being bought, and, one wholesaler stated that if a man required a carload of material, he would quote him a certain price, but if he wanted half a million feet, the figure was raised accordingly as the delivery of this quantity could not be made within a short time. Prices were liable to take jumps and it was necessary to protect himself against such contingencies.

There is quite an active demand for 1 in. 1½ in. and 2 in. mill run white pine in the Buffalo and Tonawanda markets. The outcome is that stocks with the majority of Ontario wholesalers and mills are lower than they have been at any time during the past four or five years. Hemlock is particularly scarce.

B. C. shingles have taken a drop and are now selling around \$6.90 and \$7.00. The demand has fallen off and further declines in prices are expected. The result of the recent aviation in shingles has been that some dealers do not care to touch them at all. There has been little stability to the whole market and the patent roofing man has taken advantage of the situation and has enjoyed a record business. Lath are still very scarce and almost any price can be obtained for them. No one ever dreamed that lath, which a year ago were a drug on the market and could not be moved at any figure, would have developed such an abnormal demand, but it is one of the peculiar characteristics of the building and general market situation. There is not much material from the Coast coming in at the present time. Orders of various lines are taken and some Easterners are figuring on scoring his business in a Western Ontario town, where, it is rumored, 500 houses will be put up by a construction company in order to meet the demands occasioned by industrial expansion, particularly in the automobile line. At least five million feet of Douglas fir, dimension and shiplap, will be required. If this order of 200 cars goes through, it will give much activity to Western wood goods.

So far as the labor situation and logging progress is concerned, these are covered in special reports presented in another column from the Ontario crown timber agents and other companies in the East.

In summing up the whole matter it would seem that the labor situation has been very little improved from last Fall, and there is still much restlessness and jumping of jobs. The one hope is that matters may steady down and a larger supply of men be available as soon as the sawmills close down, which the majority of them will do at the end of October or by the middle of November. This has been a particularly fine Fall for operating, and those who had a supply of logs, have taken full advantage of the opportunity.

The main topic of conversation is the price of lumber for next year, which some predict will show an increase of \$5.00 per M. on all kinds of softwoods, whereas in regard to the hardwoods there is no foretelling how exalted quotations may be. Cost of production climbs all the while. It is interesting to know that before the war the wholesale cost of white pine for box and better was \$20.00 to \$22.50, and today the figure is from \$45.00 up. In hemlock, the pre-war quotation for No. 1 was \$14.00 to \$17.00 wholesale, and today the figure is \$32.00 to \$35.00. In merchantable spruce the figure before the European conflict was \$16.00 to \$18.00 and today it is just double, \$35.00 to \$37.00 being the reigning quotation. In Western woods the advances have been particularly striking and the market from the other side has been decidedly brisk. A graphic description of Western conditions, so far as the lumbering situation, present and prospective, is concerned, was furnished by Maj.-Gen.

A. D. Rae at the recent meeting of the Wholesale Lumber Dealers' Association, a full report of which will be found in another column.

In hardwoods there is a scarcity of all kinds of thick stock. Many inquiries are being received for two and three inch birch which cannot be filled. Three inch soft elm for automobile manufacturing is also being called for but the supply is very limited, while agricultural implement men are asking for two, three and four inch maple and can get only small quantities.

The lumber trade has informed the Ottawa government that 44,000 Canadian cars are withheld in the United States as against 23,250 American cars in Canada. It is hoped that things will be evened up in the near future.

Announcement was made at the City Architect's office, Toronto, recently that the end of 1919 will see approximately 2,300 new houses occupied or ready for occupation in Toronto. This is a larger number than was built in all the cities of Ontario put together in 1918. Permits have already been issued for 2,400 brick houses in Toronto this year, and 2,200 of these with about 100 frame and rough-cast dwellings, will be finished by the year's end. Building permits in Toronto so far this year represent some \$14,000,000 which is reported to be nearly three times the value of the permits issued in Montreal where progress was checked for a considerable period by the building trades strike. All over Ontario the end of the war has been followed by building activities, despite the high cost of material and labor.

The housing problem is a serious one all over the country. There are not enough houses for the people to live in, and they are not being built fast enough to meet the demand. This makes a rather good outlook for the lumber industry for next year, but there is some doubt whether production will be advanced so that full advantage can be taken of the demand. Labor is in smaller supply than it should be, but even worse than this is the disposition of labor to loaf on the job or to refuse to labor at all. It is quite probable that were every laborer disposed to exert himself, production in all lines could be speeded up to a point where supplies would be nearly, if not quite, adequate.

United States

The brisk demand, which has been in evidence for all kinds of lumber, has fallen off to a certain extent. This is caused owing to the approaching Fall months and the subsidence of building activity and, to a certain extent, by the car congestion at various points. Another contributing factor has been the steel strike and the industrial unrest which has characterized many cities and towns. In some lines there is a softening of prices, particularly in Southern pine, but even with the decreased demand, it will take the mills a long time to catch up with production. Prices are changing rapidly on a number of other lines, rising and falling, so that it is almost impossible to keep tab on the general situation.

The first recession in 1919 building activity as indicated by building permits issued, is manifest in the September returns. Official reports from 160 cities give a total estimated valuation for September of somewhat over \$137 million as against an estimated valuation of about \$161 million from 153 cities for August—which was the biggest month of the year. Seventy-eight cities show a decrease in September, 67 show a gain over August. The general outlook is not at all reassuring owing to the continued demands of labor, and if trouble does not break out in one trade, it seems to find an opening in another. The steel strike is petering out, but there looms ahead the possibility that the production of a large part of the output of fuel will be stopped the first of next month by a strike of soft coal miners because exorbitant demands have not been met. In fact, in most lines of staple production, labor troubles, past, present or prospective, make the future very uncertain.

The lumber industry has not been entirely free of trouble of this character. Strikes or threats of strikes have handicapped the manufacturers, while building operations in many places have been hampered by the demands of workmen. Another thing which has militated against successful operation in the lumber industry is the difficulty of getting supplies to market. Car shortage, or a shortage of motive power, is prevalent all over the country where lumber is produced. The effect just at the present is not as bad as it has been in the immediate past, for building operations, particularly in the country districts, is less pronounced during the cold weather.

Production has nowhere been up to normal, because of labor

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

shortage and indisposition on the part of labor to produce. This takes the form of less work during working hours, and refusal to work at all while the laborer has enough money to pay for the next meal and the next night's bed.

There is a steady demand for hardwoods and the factory demand keeps up well although building requirements have fallen off a bit. Offerings in many centres are limited. Production at several of the important hardwood centres during the last few weeks has increased, but this has brought no increase in unsold stocks as the output has been fully covered by demand. Supplies of quartered white and red oak are at rock bottom and the market is strong at the highest prices ever quoted. Plain oak also is in an exceptionally good position; in fact, in all the woods unsold stocks are extremely light as compared with normal for this time of year. The hardwood industry, in the South especially, is experiencing a car shortage that is retarding shipments.

There has been a falling off in the demand for southern pine and prices are somewhat weaker. The decline in the demand for southern pine, in common with most other building woods, seems largely confined to the cities, and should this situation continue the manufacturers have hopes for at least a brisk country trade during the late fall and early winter to support the market in the meanwhile. However, any real period of trade dullness seems out of the question, especially for the reason that a great building season is expected next spring and the retailers are likely to start their buying for spring requirements early to make sure that they are under cover. Heavy rains in some producing sections have interfered with operations considerably during the past few days. A considerable decrease in demand is reported in Douglas fir and there is none too good conditions prevailing in regard to transportation and distributing.

Great Britain

It is interesting to note in connection with the British market that, according to a letter recently sent out by one Liverpool firm, the arrivals of New Brunswick and Nova Scotia spruce deals at Liverpool and Manchester during the month of September amounted to 14,000 standards, and the stocks now total over 22,000 standards. It is stated that the consumption was disappointing, largely due to the goods already sold being held up owing to transportation difficulties.

The arrivals of Douglas fir at Liverpool consisted of 85,000 feet, and the consumption was light. Continuing, the report says, in respect to Scandinavian deals and boards, that there were no arrivals of flooring boards to Liverpool, and only a small quantity to Manchester. The consumption was satisfactory. Stocks are light and values firm and deals arrived in fair quantities.

The import of pitch pine consisted mainly of pitch pine lumber. There was a fair consumption, but stocks at Manchester and Liverpool now amount to nearly 1¼ million feet. Congestion and lack of distributing facilities curtailed deliveries, so that the stock includes timber that would otherwise have gone into consumption. C. I. F. quotations are at present somewhat easier.

The demand for hardwoods during the past month, especially the latter part of the month, on account of the railway strike, was very dull and inactive. Consignments still arrive freely and owing to the poor consumption, aggravated by transport difficulties and labor unrest, the major portion has gone into store.

The government auction sale of hardwoods sold without reserve, held on Sept. 25, was well attended. The bidding was brisk

throughout and the quantity offered was cleared at satisfactory prices. The auction sales of mahogany held during September were well attended, and the moderate quantities offered were cleared at prices which show an advance upon the preceding sales. Sound, well-squared logs of cedar are in demand, but there is no enquiry for round logs.

Lately the inquiry for fresh goods was a little more active, probably on account of the short period which now remains for shipping. Many firms have this season endeavored to put off buying in the hope of obtaining autumn bargains, as they often did in pre-war days, but the sudden strike has now upset all their calculations. It is principally Swedish stocks which are inquired for, and especially the Gefle and Soderhamn makes. For even if the price of common wood should fall, it is not impossible that the value of prime productions, and especially of larger sizes, can be reduced. The import cost at the present time is so heavy that there is only a moderate profit on the present selling prices, and the supply in proportion to the demand is very short.

There is anxiety in all the ports as to coming timber arrivals. Surrey Commercial Docks, the largest wood depot in the world, are already congested. The 200 acres of piling grounds are becoming crowded, especially those close to the six miles of quays.

Mr. Montague L. Meyer, who is disposing of the Government timber stocks, of which he was the official buyer during the war, says: "There is timber congestion in every large port in the country. This is due first to the shortage of small timber ships that could enter the smaller ports and so distribute the arrivals; secondly, the shorter day, slacker labor, and shortage of barges and transport. Large quantities of Government timber are already here from Scandinavia, and have been sold to the trade in addition to what has come on private account. But the congestion at the ports is aggravated by the difficulty of getting it inland, to Birmingham and elsewhere, where it is wanted. It must be remembered that timber is a seasonal trade. Most places of origin close in October because of the frozen waters, and do not open again until May. We have to get the wood in for the coming reconstruction schemes or there would be a shortage that would be worse than a temporary congestion. The congestion will be worse before it becomes better, which should be by Christmas. By then I expect we shall have in about 150 more cargoes from Scandinavia, Canada and America—in all 150,000 to 200,000 standards (each standard 165 cubic ft.). All departments are working to distribute it to ports where the congestion is least pressing at the time and the ships can be accommodated."

Among the many lessons of the war is that home-grown timber, when graded and properly seasoned, is in no respect inferior to imported wood for most purposes, says "Timber". The problem of encouraging the use of home-grown timber is engaging serious attention inside and outside the trade, and the growing number of merchants interesting themselves practically with the exploiting of English-grown trees is a remarkable sign of the times.

It is asserted that the Government is not the best agent for the manufacture of timber, and that the latter should be in the hands of the trade. As regards sources of supply, it is urged by the friends of home-grown timber that the United States may in the future be ignored as a regular source of supply, as the American market is unable to do more than supply its own requirements. In Canada it is asserted that, although things have not yet touched the same low level, they are tending in the direction of depletion, a somewhat remarkable statement in view of the existing conditions of demand and supply.

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Local Business at St. John Good—Export Fair

During the past month business at St. John has been, locally, very good. Prices have kept up and consumption has also kept stocks moving in good volume. The general building trade has been active, and a large amount of remodelling of buildings, both exterior and interior has taken place. A considerable number of old structures of quite a large size have changed hands and are being converted into apartment houses. These are in good demand at reasonable rentals, which are leaving the owner a fair return on his investment.

The St. John Housing Commission have let a contract for twelve houses, some being self-contained and some semi-detached, which are being erected in Lancaster, near the C. P. R. elevators and within sight of the St. John winter port, on good high land affording a fine

view of the harbor. These dwellings will cost about \$4,000 each, including land. The demand for all kinds of finish for houses is very heavy, showing very little signs of abatement. Stocks are very scarce, B. C. products being especially so, and also very high in price. This, of course, is helping the Eastern manufacturer sell his own native stocks, such as spruce and pine, at prices about same as B. C. products, but his opportunity to get deliveries to his works are much better than if B. C. products were supplied.

The factories are all busy and will continue so for at least some months, largely on interior finish for construction now being carried on.

Refuse lumber is in fair demand and bringing good prices in the local market.

Laths, locally, are almost impossible to find and prices range

ST. JOHN, N. B.

about \$6.00 per M and upwards. There are practically no laths at St. John to-day for local consumption.

The English market for foreign shipment still remains in fair condition. Freight rates are not quite so firm, around 225 shillings being the offered price of steamer charters for the British ports. Of course, some vessels are getting somewhat greater freights, but on a whole it is felt that conditions will weaken in freight charges. Prices are fair and it is felt that they will continue so. Any manufacturer with a good specification of 7 x 3 and up deals, carrying a good percentage of 9 inch and up, can get a good price.

The American market is weaker than a while ago, and shows no signs of improvement. With winter coming on and business in building slowing down, not as much demand will take place; also many portable mills are sawing this winter. What effect this will have remains to be seen. If the winter is severe, not as much lumber will be cut, as is anticipated, and supplies are cut down and the present demand keeps up, a good price will be realized.

Two St. John mills have ceased operations for the season, the Randolph mill, and one of the Murray & Gregory mills below the Falls. All others are operating and will continue to do so until the closing of navigation.

Logging crews are now in the woods. Men are scarce, wages in some localities being \$75.00 to \$80.00 per month with board. With high supplies and higher wages than a year ago, as cheap a log as in 1919 certainly cannot be expected.

Business in Montreal Moving Along Well

Business in Montreal has picked up all along the line. There was a lull for a short time, but orders are now coming in more freely, and prospects are cheerful. Locally, the demand is better, due to more building coming out, while the sash and door factories and the box makers are doing a satisfactory turnover. Lath is firm and difficult to obtain. A considerable amount has been sold from the saw. The chances are that next spring it will be almost unobtainable. The orders from over the border, which dropped for a time, are now picking up, although on some lines foreign cars are in very short supply. Hardwoods are very firm, with a fair business passing. In B. C. stocks, the chief demand is for timber, other descriptions being slow on account of the high prices ruling. Shipments are none too brisk.

Building is undoubtedly improving. The permits taken out last month reach a high total, the records showing considerable additional constructional activity, notwithstanding some labor disturbances. There are two very large buildings included in last month's permits, although the chief new work is an apartment and other houses. Montreal is very short of dwelling accommodation and unless there is still more progress in building, the famine will become very acute.

The labor situation is more settled. The strike of the employees in the box-making factories was short-lived; the men going back on the old conditions. A dispute at St. Therese, near Montreal, involving a strike at three piano factories has gone before a board of conciliation. The strike in the Montreal building trade is gradually dying out. Many men are now back at work, although the unions claim that it is at higher wages. It is certain, however, that men are now employed under the old conditions, despite the pressure of the unions.

The export season is now drawing to a close. Practically all the Government lumber has been shipped from this port, and the greater bulk from Quebec; it is probable that a small amount in the latter port will be left over until next season. There is promise of great activity at the winter ports, but it is certain that a considerable stock in the Maritime Provinces will not be lifted until 1920.

A further decline in the exports of pulpwood has to be recorded. For the month of August the total of \$944,877, was \$1,033,135 below that of the corresponding month in 1918. The aggregate for five months of the fiscal year is \$4,051,118, a falling off of \$3,905,148. During August paper substantially advanced, while chemical pulp gained \$73,000 and mechanical pulp \$3,000. For the five months chemical pulp decreased \$7,562,000, and mechanical pulp increased \$67,500.

The Market at Ottawa Slackens up Somewhat

A slackening of demand, coupled with confidence that a fair winter's business would be done, were the features of the Ottawa lumber market, during the closing period of October. A decline in orders and inquiries were noted, especially from the United States, but at this season of the year trade reports indicated that such was to be expected. Business, in the general opinion of lumbermen, was better than for a corresponding period a year ago, even if somewhat quieter than during the preceding two weeks.

That there is no tendency toward the market weakening was indicated by prices, which remained absolutely firm, and in three

of the better pine grades advanced. The top notch figure for good pine, inch and inch and a quarter siding, was reached when the manufacturers' prices took an eight dollar jump and went to \$110 per M. The reason given for the increase in these particularly fine grades is that stocks were low and the demand is fairly heavy. Some lumbermen looked at it as a matter of replacement of stock and if the purchaser did not want to pay the new price, they did not seem much worried, consoling themselves that before the winter months were through their stocks would bring more money.

Local, domestic, and foreign business outside of the United States remained just about the same as it was during the two preceding weeks.

For ocean export "bottoms" were the whole thing and they continued scarce. Reports at Ottawa were that with the settlement of the British railway strike, shipping was getting back to where it had been before, with the result that the orders on Government account to the Old Country were beginning to move more freely. Patience seemed to be the virtue of most shippers to the Old Country, they expressing their contentment with the procedure of affairs by remarking, the stock was purchased by the British Government. It is going out of the country, which lessens existing stocks here. And the sooner it gets across the more opportunity there is for ocean space to ship on our own account.

The car situation to the United States became a little more acute than it had been. A few orders were delayed. Some shippers prophesied that it could be expected as the beginning of one of the worst car shortages that the local trade had ever experienced. Various reasons were given for holding this view. Some took the position that during the war fewer cars had been built by American roads for use in the United States than during the pre-war years. To further add to the troubles of the retail situation there had been a big increase in commercial shipments since the armistice was signed, which taxed the railways to handle the business. Now comes the movement of the western grain crop, and there is not the usual number of cars available which are in first-class condition.

Another point in support of this was that railway reports to the shippers intimated that there were more Canadian cars on American roads than there were American cars on Canadian rails, hence a shortage in car space could be easily noted.

The labor situation so far as the woods were concerned, began to tighten up a little. Reports from manufacturers and operators indicated that while there was still a pretty good general offering of bushmen, their numbers were not as great as they had been. All the help that is needed for the woods camps has not yet been obtained. Even when labor is obtained and shipped to the woods, the seemingly ever prevalent problem of the "transients" throws a monkey wrench in the machinery, so far as production is concerned. Woods operators, even in spite of the obstacles before them, are setting their backs, and believe the timber output of the Ottawa Valley for the 1919-20 season will establish a high record over the war years.

The sawmill season neared its close, but if logs and labor hold out it is the intention of the mill heads to cut well up till the ice begins to form.

Conditions with the woodworking plants and factories remained about the same, there being enough business in sight to keep them busy. There was a good demand for furniture and, in some circles, there was a shortage of cabinet makers' labor. One plant was working fifty hours per week and paying forty-five cents an hour, and reported it could use more hands.

Shingles and lath, though they did not advance further in price, remained scarce, and reports agreed that stocks of both were low and hard to get.

Big Schooner for Carrying Timber

Mr. Alexander Livvantaal, Montreal, has designed a four-masted schooner for the purpose of carrying lumber. The idea is to build the vessel mainly from the lumber to be carried, the ship to be dismantled at the end of the voyage; certain parts of the vessel, including the rigging and the internal combustion engine for steering, would be shipped back to Canada. He estimates the construction of these ships at about twenty dollars, plus fifteen dollars for sailing, a total of thirty-five dollars per standard, to which would be added a royalty to the owner. The ship would be manned by twelve men, comprising the captain, mate, second mate, cook, wireless operator, engineer and six men. Mr. Livvantaal, who was born in Switzerland, is a naturalized Englishman, and now proposes to settle in Canada. He states that he was connected as a consulting engineer, with Sir William Armstrong, and the late Count Zeppelin. We hope to be able, at a later date, to give full particulars of his lumber ship, which differs in essential particulars from the Davis raft, which will convey B. C. lumber, bought by the British Government, to England.

Turkish Figs

We have already told you of the fine lot of Smyrna Figs which we have secured and now desire to let you know that many lumbermen and contractors have bought freely of this fruit for their camps. One company has taken as many as two hundred and fifty bags for distribution to their several camps.

You who have not yet tried them do not know that you are missing one of the best food propositions which you have ever had placed before you, for the quality of these figs is simply superb and the price very moderate indeed.

Fancy Turkish Figs, Bags about 65 lbs. 18½c.

For Rapid and Economical Moving of Lumber Use a Bell Locomotive

*Operated
on Liquid
Fuel*

For efficient hauling of heavy loads the Bell Locomotive gives a tractive power of special advantage in the lumber industry. It saves labor, time and money. Because of its high grade mechanical construction and material it can be relied upon to give long and satisfactory service with constant use.

Can be operated on kerosene, fuel oil, distillate or crude oils. Emits no hot ashes or sparks.

Has 50% greater tractive effort than direct-connected type locomotive of equal weight. Operated by one man—one valve fire control. Standardized Design—all parts interchangeable and kept in stock for immediate delivery.

Write for catalogue and prices to-day.

In the accompanying views, looking from left to right, the first shows two black spruce (left of centre) attacked by Bud Worm. The next scene shows young trees in the foreground entirely denuded and the larger trees badly damaged. The last view shows a dead fir after an operation.

The Spruce Bud Worm Ravages

By H. S. Laughlin, Chatham, N.B.

The Spruce Bud Worm is reported as having done considerable damage in the province of New Brunswick and during the present years its ravages have surpassed anything previously reported.

Loggers state that there was no evident sign of the worm in the Tabucintao watershed last year, but this summer the stand in places had the appearance of being fire swept.

On investigation it was found that the last five years' growth of the trees affected had been suppressed, so much so, in fact, that the total growth for these five years was no more than the one year's growth just previous. This seems to be sufficient evidence to prove that the bud worm has been affecting the timber for the last five years, and, no doubt, gradually increasing in number and its ravages increasing in proportion.

Balsam Fire has suffered the most. In the areas affected this tree has been absolutely denuded and there is very little or no chance for its recovery. This is more especially true in areas where fir has been left standing after logging.

Black Spruce has been damaged to considerable extent too but not so much as the Fir. In mixed stands of Black Spruce and Fir the worm seemed to attack the Fir in preference to the spruce. But in the pure stands of Black Spruce the tree has been greatly damaged. Some of the younger trees have been entirely denuded and will not recover. The larger, sturdier trees are still green, though the terminals of the branches and twigs are denuded, yet early in September a few of the dormant secondary buds burst, sending out their tender light green shoots. It is feared that these shoots will be too tender for the early frosts but there is not a great abundance of them. The belief is that the greater proportion of these buds will hold over the winter and that bursting forth next spring will aid the tree in recovering. But next spring will have its own story to tell.

The White Spruce seems to have escaped so far from the ravages. Several instances were noted where this tree had a healthy crown, even in the midst of attacked trees.

Personal Paragraphs of Interest

W. T. Mason, of Mason, Gordon & Co., Montreal, was in Toronto lately on business.

J. B. Knox of Knox Bros., Limited, Montreal, spent a few days in Toronto recently calling upon the trade.

J. L. Campbell of Campbell, Welsh and Paynes, Toronto, and daughter, have been spending a few weeks' holidays at Atlantic City, N.J.

F. A. Kirkpatrick, of Muir and Kirkpatrick, Toronto, who was confined to his home with illness for several days, is able to resume his duties.

Hugh A. Rose, of Toronto, who represents Mason, Gordon & Co., left lately on a business trip throughout the Maritime Provinces.

J. H. Lefebvre, of Howick Station, P. Q., died in Montreal on October 13, after a brief illness. He was largely interested in lumber operations in the Province of Quebec.

M. C. Foley has embarked in the wholesale lumber business under the name of the Foley Lumber Co., and has opened an office in Room No. 31, Canada Permanent Building, Toronto St., Toronto.

James W. Sewall of Old Town, Maine, reports that there seems to be considerable increased activity in timber circles in the northeast. His business of estimating and valuing timber reflects such activity to a marked degree and forms a fairly good barometer of conditions. His office is engaged in surveying, and estimating the

pulpwood and lumber on over 700,000 acres of land scattered from New York through New England to the very northern end of New Brunswick. Ordinarily at this time of year timber cruising work becomes quiet.

O. A. Gignac, of J. H. Gignac Ltd., lumber merchants, Quebec, has been elected a member of the executive committee of the newly-formed Quebec division of the Canadian Manufacturers' Association.

H. Brown, of the Atlantic Lumber Co., Toronto, will leave next month on an extended trip to the Old Country. Since his return from overseas last spring he has been actively engaged as a lumber salesman, assisting J. W. Jacobson, local manager of the Atlantic Lumber Co.

S. G. Denman, Montreal, the Eastern Canada representative of the Import Lumber Section of the Board of Trade, London, has sailed for England to confer with the department as to the shipping during the winter of the Government bought stocks in Canada, from Halifax and St. John.

Lieut. Col. R. H. Webb, formerly of the Webb Lumber Co., Toronto, has returned after having been in service overseas for more than five years. He was one of the First Canadians to enlist in service and was wounded several times, being unfortunate enough to have his leg shot off by a shrapnel shell, which killed fourteen men behind him.

Sidney R. Anderson, wholesale lumber dealer, who recently opened an office in the Manning Chambers, Toronto, intends leaving on a trip to the Old Country about the middle of the present month and will be accompanied by Mrs. Anderson. He received the sad intelligence a few days ago that his mother has passed away at Hull, England.

Brig.-General W. B. R. Hepburn, C.M.G., M.P., of Picton, Ont., has arrived in Canada, after three and a half years' active service with the Canadian Foresters. He went overseas in April, 1916, with the rank of major, and after sometime on the headquarters staff in London, was appointed deputy director general and second in command of timber operations. O. M. F. C. During his absence overseas Brigadier-General Hepburn was re-elected to Parliament by his division, Prince Edward County.

Know Your Costs When Estimating

Once upon a time (that is the way all stories should begin) two retail dealers figured against each other on a bill of material for a building to be erected on a farm. Before going any further, we will say that this is a true story, says the "Mississippi Valley Lumberman." One of these dealers was the manager of a yard belonging to a line yard concern, and his figures had to be confirmed and approved by the headquarters office. His estimate came to just an even thousand dollars. The other dealer cut his figures to the bone—and then some—and his estimate was more than three hundred dollars less than the yard manager's total.

He had been so afraid that he would be too high that he had cut all the profit, and more than that, out of his estimate.

But he learned what the yard manager had bid, and immediately tried to recoup. He went to the customer and told him that he had made a bad mistake, and that he could not sell the material for so little. He then named a new price which was thirty-five dollars below the figures of the yard manager.

Meanwhile, the estimate had gone in to headquarters, where an error of seventy-five dollars was found, and the manager was immediately notified.

This left the other dealer the higher bidder by forty dollars, and he wondered why he did not get the order.

The moral to this story is that every dealer should know what it costs him to do business; then he should figure every bill at a fair profit and then adhere to his estimate.

Handle it Mechanically

EDGINGS

Ontario

Wm. Bonter & Sons, Marmora, Ont., contemplate building a saw and grist mill.

D. J. MacDonald is erecting a new sawmill on Turner St., Ottawa. The building is one storey high, 36 x 40 ft.

The C. Beck Mfg. Co., of Penetanguishene, have bought the mills and timber of the Little Current Lumber Co., Little Current, Ont.

The offices of the Canadian Pulp & Paper Association have been removed to 701-2 Drummond Building, St. Catherine St. West, Montreal.

A provincial charter has been granted the Empire Timber, Lumber & Tie Co., Ltd., with headquarters in Toronto and a capital stock of \$85,000.

The Alfred McDonald Lumber Co., of Peterboro, intend erecting a new box factory and will also further develop their sash, door and planing mill business.

A provincial charter was recently granted to the Laoc Coal & Lumber Co., Limited, Hamilton, to manufacture and deal in lumber and other wood products.

Victor Attridge, who for many years has conducted a planing mill and lumber yard in Schomberg, Ont., has disposed of his business to Burnel Graham of that place. Mr. Attridge is now building several houses in Schomberg.

Manufacture of tone arms, motors and accessories for phonographs is being undertaken in Kitchener by the General Phonograph Corporation of New York, which has purchased the Pollock Manufacturing Company's plant, according to an announcement by Mr. A. B. Pollock.

The Elliot Woodworker Company, of Toronto, have secured the plant in Belleville formerly occupied by the Burrill Rock Drill Co., and expect to commence operations in a few weeks. The new plant is well equipped with metal-working tools. The Toronto plant will be continued for a time at least.

Marks-Hanley, Limited, has been granted a charter to carry on the business of lumbering, planing mills and to manufacture woodenware of all kinds as well as deal in timber, lumber, etc. The capital stock of the company is \$15,000 and the headquarters in the city of Ottawa. The provisional directors are Edward Marks, E. A. Hanley, Wm. H. Hanley.

A charter has been granted to the Partridge Lumber Co., Limited, with headquarters in Rainy River and a capital stock of \$100,000 to carry on the business of timber merchants, sawmill proprietors and timber growers and to buy, sell and deal in timber and wood of all kinds. The incorporators are Thomas M. Partridge, Harry F. Partridge, of Minneapolis, Minn., and Wm. J. Moran and Charles W. Chappell, of Winnipeg.

J. E. L. Streight, of Islington, Ont., has completed a new office and stables in his lumber yard and hopes to have his new sheds ready by the new year. It is Major Streight's intention to build a new planing mill in the Spring. It will be a two-storey brick structure of the latest type and embody all modern ideas. Business has been good during the past season and is continuing active right along. Major Streight says that one difficulty during the summer was a shortage in help.

It is understood that M. J. O'Brien, Limited, a \$20,000,000 corporation, will erect a large pulp and paper mill at the north end of Lake Temiskaming. During the past year preliminary survey has been carried on and with reasonable assurance of an adequate labor supply, the big project is expected to be launched next year. Waters tributary to the Quinze River and the Quinze Lake flow through territory containing vast pulpwood resources which, with care, appear to be practically unlimited for several generations. The company own and control part of the great water-power of the Quinze River, the whole of which would make it possible to generate 100,000 horsepower or double that amount, according to some authorities.

A new company, with the title of the Judge, Jones Milling Company, of Belleville, has been formed, and comprises of the firms of Grahams, Ltd., Belleville, and the Judge Grain Company, Montreal. The new concern is building at a Belleville a mill to manufacture about 250 barrels of flour, 250 barrels of cornflour, one hundred barrels of rolled oats, three hundred barrels of corn meal, and one thousand sacks of feed per day, in addition to an elevator to handle oats and a quantity of grain, for cleaning and bagging in transit. Mr. Geo. B. Jones, of the Judge Grain Company, Montreal, is removing to Belleville to look after the Judge, Jones Milling Company's interests there. Mr. Jones is a miller of several years' experience.

A controlling interest in the Toronto Paper Mfg. Co., Ltd., has been sold to the Howard Smith Paper Mills, Ltd., of Montreal, the figure for the stock being \$138. a share. The company's authorized capital is \$1,000,000, of which \$750,000 has been issued. Under the terms agreed upon every shareholder has the right to dispose of his stock at the figure named, and the Howard Smith Paper Mills is prepared to pay more than \$1,000,000 to secure control. As soon as sufficient stock has been turned over to insure the consummation of the undertaking, the officers of the Toronto Paper Mfg. Co. will step out. The president of the Toronto Paper Co. is R. S. Waldie and vice-president, W. J. Sheppard, of Waubesa. Both are widely known in lumbering circles, the former being vice-president of the Victoria Harbor Lumber Co. and the latter president of the Georgian Bay Lumber Co. The Toronto Paper Mfg. Co. has a large plant at Cornwall, which was established a number of years ago by the late John R. Barber, M.P.P., and others.

Eastern Canada

A large vessel, the "Ilmanau," of London, called recently at Rimouski and loaded 2,500,000 feet of lumber for Price Bros & Co.

John D. Walker, of Rexton, N. B., is starting a winter operation at that place and expects to take out between four and five million feet. Part of

this timber will be for winter sawing and the remainder for next summer's cut.

The Grand River Co., Montreal, P. Q., has been incorporated to manufacture and deal in lumber, pulp, paper and similar products. Capital \$50,000. E. E. Howard and W. H. Howard, barristers, of Montreal, are two of the incorporators.

Ewart C. Atkinson, of Fredericton, Peter Mahoney, of Gagetown and Abner B. Belyea, of Fredericton, have been incorporated as E. C. Atkinson Lumber Company, Limited, with head office at Gagetown and capital stock of forty-eight thousand dollars. The company is authorized to transact a general lumbering business.

La Compagnie Saguenay Limitee, Chicoutimi, P. Q., has been incorporated to manufacture and deal in lumber, wood products and pulpwood. Capital \$25,000. W. Blanchette and J. B. Claveau, lumber merchants of Chicoutimi, are among the incorporators.

The Walter Walton Co., Ltd., insurance specialists, recently opened an office at 310 Coristine Building, Montreal, with Mr. H. B. Warren as manager. The parent company's offices are in New York. The company do a general insurance business, but specialise on lumber, mills and woodworking plants.

The St. Anne Lumber Co., Montreal, P. Q., have been incorporated to own and operate mills, factories, etc., for the manufacture of timber, lumber, pulpwood and other articles made of wood, and to manufacture and deal in lumber and wood products. Capital \$500,000. L. H. Ballantyne and F. G. Bush, Montreal, are two of the incorporators.

The total cut of wood expected during the coming lumbering season in the Abitibi region will reach seventy million feet of cut and prepared lumber. This is unprecedented in bulk totals. There are at present in the Abitibi region, fifty-five sawmills in operation and they work almost the whole year round. The coming season's cut is under way with excellent prospects.

The Davison Lumber & Mfg. Co., Ltd., of Bridgewater, N. S., who were manufacturing specially prepared, dry, pressed baled sulphate and sulphite pulp chips, closed down their plant some months ago when ground wood pulp took a slump, and have since not operated owing to being so busy in their lumbering, hardwood flooring, planing mill and box factory departments, in all of which they have orders to last for several months.

Speaking at a meeting of the Quebec Manufacturers' and Merchants Association held in Quebec, the Hon. D. Pelletier urged the development of trade between the province of Quebec and Europe. As a result of his eight years' experience in England, he believed there were splendid openings for this trade and he mentioned in particular that there was a great demand for lumber, toys and articles of various descriptions in wood. It was essential, however, that an office be opened in London, with a special representative.

The forests belonging to the late E. Stebelin, of Weymouth, N. S., were recently cruised by a party of surveyors, who have found in the property 48 million superior feet of merchantable spruce and pine, 70,000 cords of pulp wood, 200,000 feet of hemlock, three million superior feet of merchantable hardwood timber and a large quantity of hardwood. The surveyors have allowed for farms, burned, etc., 1,000 acres, leaving a solid block of 8,500 acres of green timber. This land, situated on the Tusket River, constitutes the largest block of timber in the west side of lower Nova Scotia.

Capt. Daniel Owen, who has just returned from an exploration by aeroplane, is to be president of a company formed to develop the pulp areas he discovered. The capital will be \$10,000,000. Capt. Owen, before going on active service, practiced law in Annapolis. A large banking syndicate, headed by the Greene interests, is said to be behind this project. In speaking of the Labrador Pulp Company, Capt. Owen said that this was unquestionably one of the finest pulp properties in the world, for not only are the million and a half acres owned by the company exceptionally heavily covered with spruce, but the property is magnificently watered.

Western Canada

Richard Arthur Trethewey, formerly head of the Abbotsford Timber & Trading Company, died at the family residence in Matsqui municipality, just outside of Abbotsford, B. C. recently. He was fifty-one years of age.

Fire recently visited the British Columbia Fir & Cedar Lumber Company's mill which was destroyed along with dry kilns, over half a million feet of lumber and also a storage shed of the Alberta Lumber Co. The loss is estimated at \$200,000.

A charter has been granted to the Elk Valley Lumber Co. with headquarters in Winnipeg. The company is empowered to purchase timber lands of all kinds and to manufacture, buy and sell saw logs, timber products, lumber, pulpwood, railway ties, etc., and to carry on the business of lumbering and pulp-making in all their branches as well as other woodworking activities. The capital stock is \$200,000.

Thirteen carloads of paper consigned to the New York Times are on their way east from Prince Rupert. This paper was made from pulp furnished by spruce logs felled on the Queen Charlotte Islands during the airplane wood-cutting industry which concluded with the signing of the armistice. Large amounts of spruce left over were sold to the Pacific Mills at Ocean Falls for the making of news-print.

The B. C. supreme court has decided that one company cannot buy shares from another company, the case in point being the action of Neil McKinnon, lumberman of Vancouver, who sued for \$108,941, the defendant being G. D. Brymer, assignee of the Campbell River Lumber Company. In 1914, Albert McKillop sold to the Campbell River Lumber Company 800 shares in the North American Lumber Company, and in May, 1916, assigned his interest to McKinnon, who endeavored to secure judgment, but failed.

Several new mills are reported in the northern and southeastern parts of British Columbia. At Boulder Creek, near Nelson, Mr. O'Neil and associates are to build a plant. Another is proposed west of that city by Basking & Stedman, and machinery has arrived for A. S. Horswill's plant at Nelson. At Kelly Lake on the Pacific Great Eastern, Munro & Morrison will erect a 40,000-foot capacity mill. The Nicola Pine Mills (Ltd.), which had its plant at Canford, Nicola Valley, burned a few months ago, plans to replace the mill. R. P. Shannon and other Vancouver lumbermen have rebuilt the mill on the north arm of the Fraser south of Vancouver and will cut hemlock exclusively, with an output of between 50,000 and 60,000 feet. This is the first mill in the province planned to cut hemlock only.

Beef, Veal, Mutton
Barrelled Beef
Barrelled Pork
Dry Salt Meats
Butter, Cheese
Oleomargarine
Eggs, Poultry
Canned Meats
Pork and Beans
Beans, Sausage, Lard
Headcheese, Mincemeat

Pure Food Products Help to Increase Production

Successful lumbermen know that keeping the men healthy, contented and in working condition is largely a matter of proper rationing. Gunns service has helped to accomplish this result in many a well-managed logging camp. Careful packing and prompt shipping always.

Use Easifirst Shortening

A big money-saver, 12 oz. of "Easifirst" replaces 16 oz. of butter or lard. Nothing better for cooking and baking.

GUNNS LIMITED

WEST TORONTO

Tapatco Stapling Device for attaching hooks gives a firm hold long after the fabric itself has become weakened by use.

Pad His Neck— and he will Do More Work

A SIDE from the humane consideration, there is a sound reason for the use of Collar Pads, in the fact that efficient service is only to be expected from a comfortable horse. It is but adding insult to injury, to whip a horse that has a bruised, galled or chafed neck. And for less than the price of a good whip you can ensure his neck-comfort by the purchase of a soft springy TAPATCO Pad.

These Pads have earned a high reputation among Canadian lumbermen. They are exceptionally well-made and fitting perfectly, are held firmly in place under the collar by our specially-designed hooks. By outfitting your horses with Tapatco Pads it is possible to get more service out of the collar itself—its use may be continued long after its worn condition would otherwise necessitate the discarding of it.

The TAPATCO Pad is made of a splendid grade of drill—with composite stuffing made by our own process.

These Pads are sold by practically every merchant who carries harness or hardware. Do not take substitutes. Insist on "The Pad with the felt washer under the hook staple" (Patented in U.S.A. Dec. 1, 1914. Patented in Canada Apr. 6, 1915). If you have any trouble getting this Brand, write direct to

Barks from two to three cords per hour

The Moreau Barker

Practice economy and efficiency in barking your pulpwood.

Use the MOREAU BARKER. It barks frozen logs in winter as easily as dry wood in summer. Logs from 3" to 50" in diameter handled with comparative ease with the Moreau Barker.

It has a tension spring which controls the wheels over all irregularities and according to the thickness of the bark.

Only 10 horse power is required to operate the Moreau Barker under all conditions.

Numerous letters in our possession testify to the reliability of the Moreau Barker and the satisfaction given to Canadian lumbermen.

We can prove that the Moreau Barker will do any barking demanded of it.

Write for further particulars.

SYRACUSE BABBITTS

in the machinery
bearings of the
biggest lumber-mills
in the world

Question No. 5

Why are some bab-
bitt metals slow and
sluggish in their flow
when they are being
poured?

Answer to the ques- tion in the circle

A frequent cause for a metal being sluggish in flow is that it was made of scrap metal, which contains clings of zinc and iron. A small fractional percentage of either of these impurities in a babbitt will slacken the flow of the metal and defective bearings almost invariably result.

This will explain, in part, why you pay more for Syracuse Babbitts than some others—we use only the highest grades of metals in alloying our babbitts. The easy flow proves it.

Let us suggest the right bab-
bitt for the bearings of your
machinery.

Here you see a photograph of Mill No. 3 of the Virginia & Rainy Lake Lumber Co.

Obtaining Results With the Right Goods

McClary's

ALGOMA RANGE

is a Range that enables the user to get his results right first time and keep his record up the longest time at least cost. In marketing the "Algoma" we keep in mind not only the first impression but also the last. It is important that you should equip your Camp with a Range that retains its efficiency and will satisfy from day to day the exacting needs of men who through active labor conditions require the best nourishment. The "Algoma" is able, through McClary's superior construction, to withstand the exceptionally heavy strain and bridge the gap from opening to closing of Camp without failure or disappointment.

McClary's

London, Toronto, Montreal, Winnipeg,
Vancouver, St. John, N. B., Hamilton,
Calgary, Saskatoon, Edmonton

Its body is of heavy Steel, the top of solid cast iron, and the Firebox a saver of fuel. It is made in three sizes to meet the requirements of different sized Camps.

BOLINDER'S

HEAVY CRUDE OIL ENGINES

Built by a Firm Who Stands Supreme in the Whole World as Oil Engine Experts

In Sizes of
10-160 B.H.P. 2 cyl.
240-500 " 4 cyl.

The Bolinder is the most economical and efficient propulsive power for

Tow Boats and Barges

It operates at a cost of only $\frac{1}{2}$ cent per Brake horse power per hour—an enormous saving as compared with steam. It dispenses with firemen—thus reducing the wage and food bills.

SIMPLE, DEPENDABLE, DURABLE

The Bolinder is extensively used in the British Navy. Some 300 Bolinders were ordered during the War by the Admiralty, some of them for Monitors patrolling the Flanders Coast—a remarkable tribute to the high qualities of the engine.

Over 13,500 Bolinder Engines equal to 650,000 B.H.P., are in successful service in all parts of the World. In Canada and the United States, the Bolinder propels vessels aggregating 175,000 tons D.W.

"THERE IS NO COMPARISON"

So said one of our most prominent Ontario Lumbermen recently when asked regarding the relative merits of the old methods of moving logs by hand and horse power, and the modern methods of moving them by **Loading and Skidding Machinery**. "There is no comparison with hand and engine work," and he should know, for he has been using six or eight of our machines for some years, and knows by practical

experience that he can handle his logs at incomparably greater speed and lesser cost by the use of our inexpensive little loaders and skidders.

Our booklet "Suggestions for the Lumberman" tells many methods of using these machines, and contains many valuable hints for lumbermen. Write for a copy today if you have not one already.

GOODHUE BELTING

FACTORY TO YOUR MILL

To the saw mill and woodworking industries we offer an unusually good belting value in our "Acme Waterproof." This belting is specially made from the best hides to run in wet places where only the best quality belt can "make good." If you require any belting you should enquire into the merits of "Goodhue Belts," then you will buy a "Goodhue." According to the conditions under which the belt has to run, we recommend "Extra," "Standard" or "Acme Waterproof"—each brand the best quality, but each made for a different service

Ask any Filer about the quality of Disston Crucible Steel—made in the Disston Works since 1855.

AN "ALL DISSTON" MILL.

It is very frequently found that every saw in use in a modern, efficient mill is a Disston.

In fact, after Disston's 80 years of leadership, it could not well be otherwise.

Wherever lumber is produced, it is known and acknowledged that Disston Saws represent the maximum in quality and in true-cutting, profitable service.

HENRY DISSTON & SONS, Ltd.

DISSTON-SAWS

A Positive Way to Cut Costs

The most progressive manufacturers employ efficiency experts to lessen the cost of production. These experts charge large fees, which are willingly paid because they usually return the expense incurred a hundred-fold.

In Canada there are many manufacturers who could wisely and profitably employ an efficiency expert; many of them are paying for power which they never use and they do not realize that their present equipment is stealing part of their profits.

It is to give expert advice on Transmission Belting that we maintain a Service Department, absolutely free to manufacturers, as a means of cutting their cost of production. The services of these experts are available through any of our Service Branches—that **your** present power waste may be eliminated, that the majority of **your** transmission troubles may be done away with, that **you** may learn the benefits to be derived from our

Reasons Why You Should Use

ATKINS STERLING QUALITY SAWS

Reason No. 1—ATKINS STEEL

Reason No. 2 -- Atkins Workmanship

WORKMANSHIP in saw making is a matter of experience. The Atkins name has been closely connected with the making of saws for nearly Three Hundred Years.

We believe we understand the science of saw making to the highest degree, and it is strictly upon the ground of superior workmanship we solicit the patronage of discriminating users of saws. Examine an Atkins with the greatest care and note with what unvarying accuracy the silver-like blade is shaped and finished. Care in workmanship is here carried to the utmost by skilled artisans whose purpose it is to keep "Atkins Always Ahead".

Power Belts at work in
the Victoria Foundry
Co., Limited, Ottawa.

GOODYEAR
MADE IN CANADA

REDUCE BELT REPLACEMENT

Changing belts costs money.

Belts which wear out quickly must be replaced frequently.

This costs money for belting.

Costs money for idle machinery.

Costs money for idle hands.

Costs money because piece-workers become dissatisfied.

Goodyear Extra Power Belting reduces belting costs.

It wears long, and so makes the belting itself cost less.

It keeps machinery and men busy, and enables everyone to produce at greatest efficiency.

This has been the experience of every one of the more than a thousand Canadian plants which use Goodyear Extra Power Belting.

For example here is what the Victoria Foundry Company, of Ottawa, say about their Extra Power:

VICTORIA FOUNDRY COMPANY, LIMITED

Ottawa,

Gentlemen;

We have certainly had great satisfaction from your "Extra Power" Belting.

We have used it on all kinds of machines. It has been in service a surprising length of time—and is still in service.

For instance—

16 months on the cone of a 30-inch Lodge & Shipley lathe.

18 months on the cone of a 24-inch lathe.

24 months on a 30-inch drill press.

12 months on main drive of a 36-inch planer.

And all still in service. Not a replacement so far. We are mighty pleased.

Yours very truly,

THE VICTORIA FOUNDRY COMPANY, LIMITED,

Men trained by Goodyear to solve belting problems are always available to confer with you. No obligation. Just wire, phone or write the nearest branch.

EXTRA POWER BELTING

BELTING STABILITY

There has been such uniformity of satisfaction following the selection of

DUNLOP "Gibraltar RedSpecial"

—"THE ORIGINAL RED RUBBER BELT"—

that we feel our quarter-century policy of "Keep the Quality Up as Well as the Production" is being amply rewarded.

"Gibraltar RedSpecial" faces any kind of a test unflinchingly. The man who wishes to talk power, "duck," or elasticity can find ample sway for his talents in a comparison of "Gibraltar RedSpecial" with any other belting.

Minimum loss of power, Mastery of heavy loads and jerky strains, Highest quality of friction uniting the plies, Adequate weight, No Stretching—these are some of the virtues of Dunlop "Gibraltar RedSpecial" Belting, proven in thousands of cases of actual use in Pulp and Paper Mills, on Main Drives in Saw and Lumber Mills, Mines, Steel Plants, etc.; in fact, in any and every kind of transmission work.

THE DUNLOP UNRESERVED GUARANTEE

If you have a difficult drive anywhere in your factory drop a line to our Head Office, or to our nearest branch, and we will send a man experienced in belt engineering to consider your requirements. If it is an instance where "Gibraltar RedSpecial" Belting may be suitably employed we will recommend its use; and we will stand behind our recommendation with the fullest guarantee ever issued by a firm producing rubber products.

Makers of Tires for all purposes, Mechanical Rubber Products of all kinds, and General Rubber Specialties.

"HAMILTON" CIRCULAR RE-SAWS

Here is a strong, rigid, well designed machine, specially gotten up for resawing slabs. The feed rolls are carried on a sliding frame that is easily adjustable to cut lumber any desired thickness. The binding or press roll is 13 in. diam., fitted with saw discs and power driven. The saw used is 42 in. diam., driving pulley 18 in. diam. x 12 in. face. Cut shows Left Hand Machine.

We also make this machine with wooden frame, having the mandrel and saw carried on an adjustable sliding frame.

Descriptive circular sent upon request.

"HAMILTON" HUSK FRAMES

Made in different sizes to suit all requirements. Frames are all of cast iron, of heavy section throughout, planed on top and bottom, with mandrel boxes lined with high grade babbitt. Mandrels are exceptionally large, of forged steel with forged collar, and the guide is the famous Parkhurst steel saw guide with steel splitter.

We manufacture a complete line of up-to-date Saw mill Machinery for either Band or Circular Mills.

DUPL**EX** FOUR
WHEEL
DRIVE
TRUCK

Lumbermen Should Study Duplex Savings

In the forests and in the towns, Duplex 4-Wheel Drive Trucks are hauling logs and lumber at a lower cost per ton mile.

The facts reported to us by Duplex operators seem almost incredible at times.

But we know they are true, because the testimony is unanimous—everywhere the Duplex is hauling for less.

Comparisons are made with horses and mules, with other trucks, and even with narrow-gauge railroads.

In every case, the Duplex shows definite savings

These decided savings are due to the principle of construction of the Duplex. It drives

with all four wheels *all the time*.

The Duplex always goes through with its load—even where other trucks would stall light.

Single tires only are required for the rear wheels, which alone means a saving of 30 per cent.

In total, Duplex savings run from 20 to 60 per cent. And it *always saves*.

Comparative tests are welcomed by Duplex dealers.

They know the Duplex will demonstrate its lower cost per ton-mile, beyond any question or doubt.

Lumbermen who study the Duplex will see how it saves.

The Largest Veneer Lathe in the World is a Coe

This one, operated in the South, cuts large hardwood logs 200 inches long, the veneer leaving the machine of the required thickness in a wide continuous and smooth sheet.

Out in the Great Pacific Northwest, where the giant Spruce and Fir trees grow, Coe Lathes are cutting logs 7 ft. in diameter and over 10 feet long into veneers of various thicknesses.

These large improved machines are the result of our 67 years continuous experience specializing on veneer manufacturing problems throughout the world. Our organization and modern plant facilities enable us to design and build large or special size machines to meet the most exacting veneer requirements.

Put your veneer cutting problems up to us. Our experience and service are at your disposal.

Have you a copy of our new Bulletin No. 101 on the drying of veneers without defects?

The Coe Manufacturing Co. Painesville, Ohio, U. S. A.

The oldest and largest manufacturers of complete veneer equipment in the world since 1852

Pyrene Fire Extinguishers

Are the Ideal Fire Protectors for your mill, for the following reasons:—

- 1st—Pyrene is death to all inflammable fires.
- 2nd—Pyrene does not freeze at fifty degrees below zero.
- 3rd—Pyrene does not deteriorate.
- 4th—Pyrene is easily operated and ever ready.
- 5th—Pyrene reduces your Fire Insurance rate 15 per cent when installed on your Automobile or Motor Truck.
- 6th—Pyrene has served with the boys at the front.
- 7th—Pyrene in one of our Holsters is ideal for your watchman in case he locates a fire in your building.

We also carry the 2½ Gal. Soda Acid Extinguisher

Ask for our Catalogue which contains a full line of fire appliances, also for our book on how to protect your factory. This book contains valuable information.

STANDARDIZED LEATHER BELTING

THE GRATON & KNIGHT MFG. CO.
WORCESTER, MASS.

THIS BOOK TELLS HOW

Here is a book that will help you to obtain actual belting economy in your Plant.

It is unusually complete with descriptions, recommendations, rules and tables which will enable you to quickly determine the scientifically correct belt for any given condition.

It explains Standardization as applied to Belting, tells you how to determine the right belt for the right place on the one true economical basis—the work to be done.

Write for it—we'll be glad to send it to you

"ABOVE ALL THE OTHERS"

That's what one user says about this Proctor Dryer compared with three other machines he operates.

Another customer after an experience of five years with his Proctor Dryer writes "The working of this machine has been entirely satisfactory. It has cost us practically nothing for repairs."

"Your Proctor Dryer has dried twice as much per day as the machine that we discarded," is the report from another user.

"Proctor" **for VENEERS**
DRYERS

give a perfectly flat and pliable product without checks or splits

Made by the oldest and largest builders of dryers.

Waterous Boilers

Are Best for Sawmill Use

To get the full steam value out of the fuel you burn install Waterous Return Tubular Boilers. It will pay you for these reasons:—

They are economical of fuel—they carry plenty of steam in reserve for use in emergencies—they can be used with hard and dirty water—they are easily cleaned and readily taken care of.

Furthermore, we build various styles of boiler settings that are dimensioned and designed to best handle the various fuels used in the sawmill. Whatever kind you use, we will install your boiler to give you the highest possible efficiency and most perfect combustion with it.

We build and carry in stock Return Tubular Boilers up to 72" x 18". If we cannot supply you at once from our yards we can turn out your order in quick time. Ask us for prices on the next boiler you buy.

We build complete Power Plant Equipment for every installation—Catalogs and Prices on request

Workmanship

Good workmanship is easily promised. Not so easily given. It has been a 35-year old tradition with us. We started that way. Have stayed that way. Of course, we back ourselves up with the most modern equipment. Boilers, Tanks, Stacks, Burners, etc., from here are right.

FIRST IN QUALITY

The Complete Matcher

Our No. 77A—Model 5

A Supreme Achievement

This matchless machine embodies everything that makes for a thoroughly efficient and desirable Matcher and Planer. It is the last word in modern woodworking machinery in design and equipment. Its work is as perfect as it is possible for human achievement and present-day machinery to produce and its capacity is far greater than any other machine on the market.

Automatic Belt Release and Tighteners; built-in Head Knife Jointers for both top and bottom heads; a Feed Roll Gearing that eliminates all chains and sprockets; Matcher Logs quickly and easily adjusted; micrometer adjustment of Feed Rolls and Platen; these are a few of its desirable features.

Its capacity for an increased output in all patterns of siding, ceiling, flooring, etc., makes it an all round superior machine.

HOCKEN LUMBER

*The Quality of Our Product
is Our Best Advertisement*

*We Solicit Your Enquiries
for Lumber in Any Quantities*

“What you get for what you pay” in buying lumber was never more important than it is today. Make your slacking dollar do its full duty in buying reliable quality only.

Hocken Lumber Company's limits in the famous La Cloche hills produce medium size, tight knotted, close grained White and Red Pine trees—straight, smooth and unblemished. Nature made them, and our up-to-the minute mill is turning them into lumber so nearly perfect that we are proud to recommend it to the trade. It is our mark of accomplishment. It is the consumer's mark of assurance.

HOCKEN LUMBER CO., LIMITED

Do You Realize the Actual Conditions in the Lumber Situation To-day?

During July, August and September this year, we shipped more lumber than was manufactured for us—The other months of the sawing season we about equalized—and our Production was over twenty per cent greater than in 1918.

This leaves us to-day with several million feet less for sale than we had a year ago.

As practically all Saw Mills in Ontario close down early in November and do not resume operations until the following Spring, this means that in the next five or six months there will be no lumber manufactured while shipping goes on as usual—

If the demand continues, present supplies cannot last much longer than February, 1920.

We think you should know actual conditions as we find them.

Two Filers From the South Who Bank on Aloxite Saw Gummers

ONE is down in West Virginia in a big mill cutting hardwood—the other in old Louisiana where they cut cypress.

Just like all filers they must have free, clean, cool cutting wheels to keep their saws on the job—and keep them right.

They both say they can always depend upon Aloxite Saw Gumming Wheels.

There is no drag to the cutting of an Aloxite Wheel—it cuts free—there is no undue friction. These boys know that.

And they know that Aloxite Wheels hold their shape and work fast.

They know that even when the saw "hits iron" that an Aloxite Wheel will grind it down without burning.

It's just the sort of wheel that should be in your filing room

Canada, United States and Great Britain, \$2.00 per year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice, at Buffalo, N. Y., under the Act of Congress of March 3rd, 1879.

Vol. 39 Toronto, November 15, 1919 No. 22

Giving Stability to the Lumber Industry

A move was begun at the last annual meeting of the Canadian Lumbermen's Association to inaugurate a statistical department by which the members of the organization would make regular returns to the secretary of the amount of lumber cut, sold, shipped and in stock. The returns would be totalled up and sent out in the aggregate to all who co-operated in the plan.

It was pointed out at the time that such figures if available would afford a ready reference and authentic guide regarding the state of the market, manufacture and distribution and thus impart stability and strength to conditions generally, guarding against overproduction on the one hand and underproduction on the other as well as affording a mass of information that would be otherwise valuable and instructive. Various lumbermen's associations on the other side of the line have for some years followed this procedure from week to week and, while progress was at first slow and many held back from joining in the move, there is now a general compliance with the programme and the old order of things would not be reverted to under any circumstances.

Thus far as great progress as is desired has not been made by the Canadian Lumbermen's Association in this step but it is hoped that further encouragement and assistance will be lent to the project. No one member will have access to the figures of another as only the aggregates are available and thus all share alike in the benefit and results.

One of the most vital elements in the production, sale and handling of lumber is to secure a clear, concise and comprehensive review of economic conditions in the trade and this is particularly important with respect to export and the domestic supply and demand. The Association, if such data as outlined was available, would be in a position to state what it could furnish, when, in what quantities, grades, thicknesses, widths, delivery points, etc. A forward movement of this character would be in line with the advancement

of the times and the larger and broader fields of activity. Expansion and greater production are the watchwords of the hour and on all sides one hears of low stocks, the increasing uses and larger calls for forest products. To secure an intelligent grasp of the whole situation, a statistical department can render great help and prove to be of much use and advantage to all concerned. Lumbermen, individually and collectively, would know where they are at and matters would proceed on a more even keel. If the Canadian Lumbermen's Association was in receipt of detailed reports with reference to leading woods—such as are supplied by associations across the border,—it would be a source of much gratification all around.

Subjoined is a review for one week furnished by a leading western lumbermen's organization and it shows at a glance the how, why, when and where of trade conditions in short, condensed form. It is hoped the day is not far distant when somewhat similar service may be presented to the members of the industry in Canada. The benefits accruing from such a convenience would be practical, timely and cumulative.

Here is the statement in question, and its various aspects and features are worth study on the part of lumbermen on this side of the forty-ninth parallel:—

"A distinct advance in the volume of orders is reported by lumber manufacturers in the last week or 10 days. Total new business at 123 mills contributing to the report last week was 62,609,000 feet—a gain of more than 3,500,000 feet over the previous week. At the same time the mills are getting a steady run of inquiries indicating that buying for the spring trade will start much earlier this year than usual. The prevailing car shortage alone prevents the manufacturers from taking on a heavier run of orders, and all advances point to a continuation of the short car supply."

"The industry as a whole still is 30 per cent. short of stocks and with a brisk buying movement opening up it is hardly expected that stocks will get back to normal this winter. While the mills last week cut 87,491,000 feet, shipments aggregated 67,809,248 feet—an excess of cut over shipments of 19,681,752 feet. At this rate it will take the mills a long time to make up the existing shortage, but with a normal car supply the surplus production soon will be overcome entirely. Rail shipments last week were 1643 cars, leaving an aggregate of 7168 cars of unfilled orders on the books of the mills. Building operations in cities in the North-west where strikes had been in progress, are getting back to normal and local orders are increasing accordingly. The total for the week was 5,611,100 feet. Export orders were 5,510,822 feet and domestic cargo orders 7,177,226 feet—a total of 12,688,048 feet of waterborne business."

The World-Wide Demand for Lumber

It is not easy in the present disturbing and abnormal situation to forecast what will prevail in the lumber industry next year, so far as demand and supply are concerned. Under ordinary circumstances, members of the industry have, by reason of conditions present and past, been able to gauge the future with a certain amount of assurance and confidence. In these days many well-timed calculations are, however, upset, whether of a political or trade character. The result of the recent elections in Ontario has demonstrated how far astray predictions may be in the realm of party politics. Still, in commercial matters, signs are not generally as wide of the mark as in parliamentary prognostications. Barring fresh labor troubles and exactions, and, anticipating the subsidence of the general unrest which has been predominant for some time, the coming season should be a banner one in the production and distribution of forest products.

There is evidence on every side that stocks are low and the number of requisitions in structural and other lines of consumption are constantly increasing, all of which will tend to speed up operation. Prices will, according to present indications, be well maintained and are likely to ascend owing to a world-wide shortage of lumber. It requires no great economic foresight to predict what will develop in this state of affairs. On the Canadian side of the border conditions are analogous to those prevailing in the United States

and the observations of a leading sales manager of one of the largest firms in America, who recently visited all their eastern offices, are timely and pertinent. It is pointed out by him that stocks are much below normal. In their own case the amount of lumber available for shipment within the next thirty days is only one-third of what their monthly average offering has been for the past five years and their stock is in no wise different from that of other manufacturers as a whole. Other observations worthy of note which reflect a careful review of the whole situation are to the effect that according to information sent out by the Department of Labor, the actual present day housing requirements of the United States is more than one million houses; four hundred and fifty thousand factories; more than six hundred thousand hotels; nearly five hundred thousand schools and public institutions; about fifty-five thousand apartments; fourteen thousand railroad stations and freight sheds, and twenty thousand theatres and churches.

The Government's estimate also is that the biggest building year the United States ever had was in 1916. It developed about one and a half billion dollars' worth of construction. The greatest volume of building material of all kinds that all the building manufacturers of the country turned out in a single year totaled in value barely two billion dollars. That was at the time when labor was plentiful and friendly to capital. To-day it is estimated that all the manufacturers of about three thousand kinds of building material and equipment which enters into the construction of modern building, cannot turn out a billion dollars worth of material, while the volume of business required at the present time would total four and a half billion dollars.

The pre-war dollar will to-day go further in producing buildings than will the same dollar expended in commodities in general. Although general commodities have been advanced 116 per cent. of what they were in the days before the war, construction costs have advanced only 60 to 100 per cent. over what they were prior to 1917. This in spite of the greatly increased freight rates since 1916.

Wages are higher than ever before. Rents have advanced throughout the country, so that buildings are a remunerative investment at present rentals, when they would not have been on the basis which obtained the early part of the year. There is little doubt but what ships will be much more plentiful next year than they have in the past, which will give China, Japan, Australia and the East and West Coast of South America, to say nothing of Europe, an opportunity to get lumber which they so urgently need.

Growth of Industrial Housing Scheme

Although Montreal has done little towards bringing into force the provisions of the Provincial Housing Act, other cities and towns in the province have taken preliminary action which should result in industrial housing schemes materializing next season. If these plans are carried into effect it will mean a considerable expenditure for lumber. From all parts of Canada come reports of a shortage of houses, due partly to the demand of our men coming home from the front, and partly to a disinclination to build, owing to the high cost of construction. Efforts are no doubt being made to meet these demands, but they are quite inadequate, and we must look to the provincial housing schemes, aided by the Federal grant, to supplement private enterprise. Even then, there will be a serious shortage of accommodation. As showing the urgent need of houses, it may be stated that the applications under the Act are nearly three times the amount available in the Province of Quebec, and that others have yet to come in. But, if anything substantial is to be done, quick action is necessary.

The city of Sherbrooke has been granted \$500,000 toward a model garden suburb to accommodate 200 families. The money is to be expended through a housing company, which will commence operations in the spring. The city of Quebec is also getting in line, the proposal being to build a model garden suburb of 500 homes, to be known as the Confederation Garden Suburb. This project again will be handled through a housing company. At Ste. Anne de Bellevue, Hull, St. Lambert, St. Jerome and Three Rivers, schemes are

under consideration, the first steps having been taken towards erecting a large number of houses. Quebec will want at least \$1,250,000 and Three Rivers \$1,000,000. In the latter place the need of houses is particularly pressing, owing to the industrial expansion there.

The pulp and paper companies have already done much in the way of providing suitable accommodation, believing that the schemes are of benefit to the companies as well as to the men. Laurentide, Ltd., the Abitibi Co., the Stadacona Paper Co., and St. Maurice Paper Company are a few names that occur to us, while the Riordon Pulp & Paper Co. and Kipawa Fibre Co. Ltd., have schemes, which will shortly go into effect, for erecting houses at Hawkesbury and Temiskaming respectively.

Possibilities of the British Market

At the request of the Canadian Trade Mission to England, the Canadian Pulp and Paper Association in June last decided to send Mr. A. L. Dawe, the secretary, to England to assist the mission in stimulating interest among the British importers of pulp and paper in Canada's production of these commodities. Mr. Dawe remained in England for three months, and the result of his study of the British markets is embodied in a bulletin issued by the Association. This deals very thoroughly with the situation, and gives some very pertinent pointers which apply to trades other than those specially studied. It is a well-written report, which is especially valuable at a time when Canada is making serious efforts to cultivate export business.

Mr. Dawe treats at length with the chaotic conditions in the paper business which followed the declaration of war, and also with the reimposition in April last of restrictions on imports from all countries except Canada and Newfoundland. The result of the restrictions was beneficial to this country, the lack of shipping facilities being the bar that prevented Canada from taking fuller advantage of her preferred position. In September the position was again changed by the removal of all trade restrictions. To quote Mr. Dawe: "Thus, the entire burden of retaining British business secured under the former favorable conditions and of making Great Britain a permanent market for their products, is placed upon the Canadian manufacturers. We have, unfortunately, the reputation of being opportunists in trade. This can be overcome if those firms who have already secured a footing in Great Britain will formulate for themselves and their representatives a definite trade policy which they are willing to maintain at all costs, remembering that export business is like advertising in that success lies in continuity of effort, the practice of keeping everlastingly at it. The British market is no place for weaklings or quitters. Unless a manufacturer is prepared to stick it out at all hazards, he had better not make a beginning. Even in the short time that I have been in England, the Canadian domestic markets recovered to such an extent that orders for overseas export, eagerly sought and thankfully received three months ago, no longer occupy such a favored position. It is open to question whether such a policy is fair to our accredited agents abroad or to the overseas consumer. The present partiality of British buyers towards products of the Empire is very real and may easily be turned into a valuable asset by the exercise of the same policy of fair play and courtesy that Canadian manufacturers extend to their domestic customers. Without it, the opportunity will be lost." The report refers in detail to the papers used in Great Britain, and expresses the opinion that the British market for newsprint should prove of prime importance in the near future.

On the subject of pulp, Mr. Dawe points out that the imports and general pulp business of Great Britain are closely associated with the British and Scandinavian Woodpulp Association, which consists of bona fide manufacturers of pulp as well as agents and merchants in the same commodity. One of the purposes of Mr. Dawe's visit was to endeavor to assist the Canadian Trade Mission in securing additional freight space for the large volume of pulp which was then ready to be shipped to England, but for which it had been impossible to obtain space. Mechanical pulp, necessarily, received the first attention as being the most urgent. As a result

of the courtesy extended by the Shipping Controller, Mr. Dawe is able to report that the bulk of the mechanical pulp that was lying in Canada last May is now on its way to Great Britain. These shipments included pulp from the Chicoutimi Company and the Gulf Pulp & Paper Company of Clark City. Talks and correspondence with the leading British manufacturers indicate that there is every possibility of substantially increasing the quantity of Canadian easy bleaching sulphite pulp of good quality and not requiring more than 6-8 per cent. of bleach. The entire market in Great Britain of bleached sulphite is said not to exceed 30,000 tons per annum.

Splendid Work of Canadian Mission

Lloyd Harris of Brantford, who is returning to Canada after acting as Chairman of the Canadian Mission in London, Eng., for a considerable period, is a splendid type of a public spirited Canadian business man, who has devoted his best energies, talent and thought to the advancement of Canadian trade and the expansion of the overseas activities of the Dominion. This work has been one of faithfulness, foresight and devotion on the part of Mr. Harris who has been arduous in season and out of season in doing all that was possible to strengthen the commercial and industrial ties which bind Canada to the Mother Country. During the war and subsequently Mr. Harris has served the interests of the Empire in extending trade in all directions and fostering stronger and more vital business relations between Canada and Great Britain.

No greater tribute could be paid to the worth and high character of his labors than that which appeared recently in the London "Times," which stated that Mr. Harris had carried the Canadian trade banner and hoisted it in places where hitherto Canada had been but a name. The "Times" thinks that the work of Mr. Harris and the Canadian Mission points a moral to the British Government, its results being precisely those which the Department of Overseas Trade should achieve. Concluding it says,—“The Government would do well to study the methods of the Canadian Mission, and even better, to call some great business men of the dominions with their virility, energy and enterprise, to assist in a consultative capacity in the vitally important task of developing British trade in fields where they themselves have prospered.”

Editorial Short Lengths

One billion feet of timber killed by 1445 fires is the estimate given for Montana's tremendous forest fire losses for the season just closed. Half of the fires were started by human agency and were preventable. The fires burned over 570,000 acres of land and were suppressed at a cost of \$1,200,000, according to figures compiled by the forestry office at Missoula.

The construction of the World's Fair buildings in Chicago in the early nineties afforded the first large northern market for southern yellow pine, according to R. C. Bryant, Industrial Examiner for the Forest Service, its use being due to its relative cheapness. A great impetus was given the yellow pine trade in the Chicago and other northern markets by this development, the demand for the product rapidly increased and it is now marketed over a wide territory extending from coast to coast.”

Canada is a young country and has not many of the traditions of the older countries of Europe and Great Britain where businesses of certain characters are handed down from father to son and have been in the family for many generations or centuries. It is, therefore, unique to find in the Dominion a lumber industry that has been conducted by one family for a hundred years. The story in the news columns of the "Canada Lumberman" regarding the history of the Johnston saw mill enterprise reverting from father to son for three generations is out-of-the-ordinary and especially in connection with lumbering, which business, from its nature, is regarded as evenascent or, more properly speaking extending over a few years at the most in any location. The name of Johnston in connection with timber operations in York county has long been an honorable

one and the members have served the community well and faithfully. Its founders have been men of purpose and steadfastness, who played an important part in the settlement and development of the district.

Bad luck in business lies not so much in the stars as in the business man himself according to business statisticians. Eighty-six per cent. of the business failures in 1918 were classed as due to the individual, while only fourteen per cent. were assigned to outside causes. Among the factors of the eighty-six per cent. of failures, compilers of figures numbered extravagance, lack of capital, and speculation outside regular business.

Lack of capital is holding up thousands of enterprises which would go far toward meeting lack of employment and scarcity of production.

Thrift and rigid economy, both business and personal, must replace extravagance if the crisis engendered by the high cost of necessities is to be met. New capital can be produced most easily and most certainly through saving. Safe investment will add to instead of detract from the business assets of the nation.

“Lack of character is one of the chief contributing causes to commercial failure,” according to a leading authority. Thrift, saving and safe investment not only are proofs of character, but developers of character.

Errors will happen in the best regulated business and the newspaper is not exempt from lapses of this kind. There is just this difference that when a private individual or corporation makes a mistake comparatively few know about it—in many cases only the seller and the buyer, the general public remaining in blissful ignorance. When an error finds its way into the public press or a trade journal there are hundreds who immediately spot it and wonder how such an inconceivable “bull” could be made. The critics forget that such inaccuracies occur every day in ordinary commercial life but are known only to a few while in the press, which reaches out in all directions, they are open and wide yet there are scores of people who imagine the oversight should never have occurred. There were until a few days ago two reputable citizens of somewhat similar names residing in Toronto in the persons of Lieut.-Col. Robert Watson of the Hart House medical staff and Lieut.-Col. Robert S. Wilson, head of the Wilson Lumber Co. The former passed away and in publishing a picture a Toronto journal unfortunately used a cut of Lieut.-Col. Robert S. Wilson as being that of the departed gentleman. Of course, the latter is very much alive. The edition had been printed before the mistaken identity was discovered and there was no redress, except to make an apology and explanation the next day. Lieut.-Col. Wilson has naturally been the subject of many jocular references during the past few days. As a military man he has managed to survive the “attacks” and can be found every day at his office in the Confederation Life Building instead of at the cemetery or mausoleum.

The Timber Age is Coming—Not Going

It is a common error to suppose that timber is gradually being displaced by other materials and is constantly becoming less important economically. On the contrary, the new uses which are constantly being found for wood more than counterbalance the substitution of other materials. The per capita consumption of timber is increasing, not decreasing, and it is fair to state that, outside of food products, no material is so universally used and so indispensable in human economy as wood. Furthermore, it is a material which beyond question, can be and is being made very much more valuable to the community at large as a result of the timber research which is always going on.—W. Kynoch, Acting Supt. Wood Products Laboratories of Canada, Montreal.

One Hundred Years in the Sawmill Business

Outstanding Record of Historic Johnston Family, of Pefferlaw, Pioneers in Lumber Industry of Ontario—Early Days in Bush of York County

W. H. Johnston, Pefferlaw, Ont.
Third generation in sawmill family

"This tree was a most peculiarly shaped one. It was a white pine with a heavy trunk, and from that trunk there grew five large branches. It was the most unique tree that I had ever seen and was practically five trees in one. Nevertheless, we got twenty-eight logs from it which were sawed at my mill."

Talking about sawmills, the Johnston plant at Pefferlaw, a pretty village located some fifty-five miles north of Toronto, on the Canadian National Railways, is possibly the most historic institution of its kind in Canada, and the Johnston family has a record in the lumber industry that is not surpassed in longevity so far as the "Canada Lumberman" has been able to learn.

It was in 1906 when the C. N. R. was being built from Toronto to Sudbury, that the survey carried the line directly through a white pine bush which was on the farm of John Johnston, a cousin of Mr. W. H. Johnston. There were thirty-five pine trees which were sawn at the Johnston mill and they made 120,000 feet of 1", 2" and 3" lumber, which was sold to the R. Laidlaw Lumber Company, of Toronto. Mr. Johnston received one cheque from them for \$2,884.61, which, considering the price that lumber was bringing in those days, was certainly a handsome return. In addition to the material sold to the Laidlaw Co., Mr. Johnston disposed of about \$400 worth of stuff to other parties, and the total income from this grove, located along the bank of the Black River, which contained some of the finest pine trees ever seen by any lumberman, was over \$3,000. The trees were possibly the largest of any ever sawn in this part of Ontario.

The Johnston family have been in the sawmill and lumbering game for practically one hundred years, and the mill has never changed hands, descending from father to son and then to grandson. True, the mill was burned a couple of times, but this did not deter the owner from going to the bush the next day and cutting timber to begin at once rebuilding operations. One hundred years is a long time in the life of any individual or institution, and that one sawmill should be operated for a century by three generations of Johnstons, is an outstanding event in the annals of the timber industry of the province.

In order that one may gain

"Here's your overcoat, Johnston! Now get! You're the biggest fibber in the party."

This was the injunction to W. H. Johnston, lumberman, of Pefferlaw, Ont., when returning from Toronto on one occasion. A company of lumbermen were assembled in the smoking car and began discussing who had seen the greatest number of logs cut from any one tree. Mr. Johnston had listened with interest to the conversation in which he had taken no part, but was finally compelled to participate in order to give his experience. When he replied that he had seen twenty-eight logs taken from one tree in Ontario, the others looked up in amazement, and one big operator handed the Pefferlaw man his coat and told him to clear out.

"Hold on!" said Mr. Johnston,

some idea of the early methods followed as contrasted with those of the present day, it is only necessary to recall that the founder of the business was Capt. Wm. Johnston, who was a native of Berwick-on-Tweed, Scotland. He followed a naval career and was captain of the "Blake," a British man-of-war, during the time that Napoleon was endeavoring to bring all Europe to his feet. The battle of Waterloo, fought one hundred and four years ago, practically terminated the military career of the little Corsican corporal. Then a large number of members of the army and navy got their discharge, and among them was Capt. Wm. Johnston, who was the grandfather of W. H. Johnston, the present proprietor of the business. Capt. Johnston came to Canada on a sailing vessel. The trip was tiresome and long, requiring three months to cross the ocean. He finally arrived in Montreal, and transportation by land in those days was about as slow as by water, and the retired naval officer decided to hoof it from the commercial metropolis to Toronto. He sent his luggage along by batteau, while he himself travelled afoot. En route he faithfully recorded each day's transactions in a diary. This was in 1816, and the entries afford a mass of information about the life and habits of the people of that period, and also gave a vivid description of the character of the country through which he passed. Some years ago the Department of Archives, Ottawa, learned of this most unique volume, and sent an officer to Pefferlaw to interview W. H. Johnston. The representative requested the loan of the diary and took it to Ottawa, and there it remains in the Archives, although Mr. Johnston, if possible, intends to secure it as a family heirloom.

From Toronto Capt. Wm. Johnston went up to Jackson's Point, on Lake Simcoe, where he took up land in Georgina Township. He was in receipt of a generous pension from the British Government, and, surveying the natural wooded resources on all sides, concluded that it would be a wise project to build a sawmill. Construction was begun on a dam at Baldwin, on the west Black River, four miles south of where he resided. Before the work was completed, the water was

raised one night and the workmen informed Mr. Johnston that the dam and all material on hand had been swept away. Mr. Johnston never bothered going to see how great was the havoc wrought.

It was some time after this that the Captain was looking for his cow one morning as "bossie" had disappeared during the night. In following the trail, he met an Indian and asked him if he had seen anything of the missing animal. The Indian replied that there was no use of looking any further east as the river flowed on that side and the cow would not be able to ford the stream, and he had, therefore, better take his steps in another direction. This led the pioneer to come and take up land at lot 23, concession 5, in the township of Georgina, where he soon discovered the lumber potentialities of the surrounding country. He

Pte. Geo. K. Johnston,
"Princess Pats"
Fourth generation in sawmill family

The sawmill of W. H. Johnston, Pefferlaw, Ont., which has been in the one family for a century. This is the third mill erected, two former ones having been burned

wanted some money to carry on construction work, and wrote to a brother in Scotland, telling him of the splendid location so far as water-power and the varied character of the timber were concerned. The brother forwarded a generous sum and suggested that he call the place "Pefferlaw," which was the name of a field on the old homestead among the heather-clad hills, and means a beautiful greensward.

Began Work of Erecting Mills

Capt. Johnston proceeded in 1823 to erect a sawmill, grist mill and woollen mill at Pefferlaw. The stones for the grist mill were imported from France and drawn from Toronto to Holland Landing by ox-team. They were then placed on rafts and poled along the shore to the mouth of the Black River, then drawn by oxen to their final destination. The Black River or Muckatoo, which is the Indian term for the stream, flows through Pefferlaw and empties into Lake Simcoe at Port Bolster, some four or five miles below the village. Just in front of Mr. W. H. Johnston's residence the Black River and Corner's Creek unite, and the location of the mill as well as the Johnston home is most attractive. It was necessary for Capt. Johnston to secure adequate water-power as soon as possible, and he began by building a dam on the river and connected the two streams with a race-way. Later he had one race-way built on the west side for the grist mill and another on the east side for the saw and woollen mills. It required the efforts of a neighbor one whole summer and fall to dig each of these ditches by the slow process of hand-labor. This man with a shovel, working many long hours a day, finally accomplished the task, and for each race-way, the excavator received his pay in one hundred acres of land, which was handed over to him by Capt. Johnston.

In viewing these water-courses to-day, the visitor can hardly conceive that such a large undertaking was successfully carried out by one lone hand. Capt. Johnston died on the 28th of March, 1851, and was succeeded by his son, George Johnston, who ran the mills and a general store as well. George Johnston died on March 6th, 1896, and was succeeded in the business by his son, W. H. Johnston, who was born July 19th, 1861, and is still at the helm. W. H. Johnston is one of the leading residents of York County, and, apart from the historic association of his family in the history of the county and the part they played in the development of the lumber business, he has always evinced much concern in the progress and welfare of the community in which he resides. Capt. Wm. Johnston had nine children, his son, George Johnston, the same number, and his grandson, W. H. Johnston is also the father of nine, seven of whom are living.

What Present Owner Has Done

W. H. Johnston has been running the sawmill and lumber business for himself since 1888 and previous to that conducted it for six years for his father, so that he has been practically identified with the operations for nearly forty years.

Capt. Wm. Johnston had three sons. He left the grist mill to James, the woollen mill to William, and the sawmill to George, the father of the present owner. The woollen mill was burned down some years ago, the grist mill passed into other hands, but the sawmill is still there by the dam and has cut as much as 2,000,000 feet during one season, which is a pretty good output considering its equipment.

In 1900 a planing mill was put up a little south of the sawmill by W. W. Corner, and in order to acquire full possession of the water-power and build a suitable concrete dam, Mr. Johnston bought Mr. Corner out in 1906 and erected one of the best dams to be found in any part of Ontario. There is 10 ft. head of water and an ample supply at all times. Mr. Johnston owns considerable deeded land in Brock and Georgina Townships and on it has yet 1,000,000 feet of timber to cut, consisting of pine, hemlock, cedar, maple, tamarac, beech and basswood. The capacity of the sawmill is about 12,000 feet a day and it operates for a considerable period in the spring, and occasionally in the fall, as business requires. A considerable trade has been built up in custom sawing for the farmers and in supplying bill stuff for those who require it.

Both the planing mill and the sawmill are operated by water-power and the latter is well equipped, has concrete floors, a matcher, sticker, planer, rip-table, buzz planer, tenoner, etc. Here any kind of dressing can be done, moulding turned out and a certain amount of manufacturing of window sash and frames, as well as outside and odd-sized doors is carried on. A large business has been established with not only the surrounding country, but in connection with the summer homes built at Jackson's Point, Sutton and other points on Lake Simcoe. Mr. Johnston not only deals in all kinds of rough and dressed lumber, but in shingles, poles, posts, lath, lime and cement; in fact there is scarcely anything in structural requirements which he cannot supply.

The Black River furnishes abundant power for both the planing and saw mills. From the raceway a concrete flume leads to the planing mill, and from the penstock the water drops on a 32-inch Lafelle water wheel, developing about thirty-five horse power. At the back of the planing mill there has been built a solid wall of concrete to prevent the premises being flooded in the spring. At the sawmill, power is furnished in a similar way, the Lafelle turbine being 56 inches in diameter, furnishing seventy-five horse power. The logs are floated to the mill and from the log pond to a flat car which runs on a railway track down into the water and has spikes at one end to catch the timber. The car is hauled up into the mill by means of a bull wheel operated by a lever and chain pull.

Every spring the adjoining yard is filled with logs drawn in by farmers and others. These are rolled from the bank to the saw carriage. The equipment of the mill, while not modern, answers the purpose very well. The circular saw is 56 inches in diameter, with inserted teeth, and the carriage is 36 feet long, but, by means of an extension, timber up to 50 feet in length have been cut. The carriage is a hand feed one and after a slab has been taken off each side of the log the setting is done by a ratchet device. The slabs are cut into firewood by means of a butting saw, and the wood drops down into a hopper, from where it is drawn out into the yard. The edging is done by hand on a small circular saw. The bulk of the logs sawn during the past season were hemlock, cedar, spruce and pine. The saw carriage and saw jack were made by Paxton, Tate & Co., of Port Perry, Ont., when that firm was in business.

Public Spirited and Progressive Citizen

As already stated, Mr. Johnston built a fine concrete dam above the planing mill in 1906, and in 1913 constructed another concrete dam at the mill site, so that he is assured of ample power. He also owns a fine farm of over one hundred acres, and, outside of his business interests, is fond of motoring, both by land and water, and as a huntsman has managed for many years to secure his full quota of deer. He is a member of the Round Lake Hunt Club, which goes in search of the fleet footed animals every fall in the Nipissing district. The walls of his office are decorated with many spoils of the chase, suitably mounted, and his rifles are encased in a gun cabinet made from the wood of the first piano that ever came into Georgina Township. Another curio is an oak pulley, taken from the flagstaff of old Fort Garry, Winnipeg. Many other objects of interest are also seen.

Mr. Johnston has always been a public spirited citizen and served as deputy reeve of Georgina Township. He was also a member of the York County Council for some years, and was warden of the county in 1908, and, on the occasion of his retirement, was presented by his colleagues with a handsome gold headed cane. Some years ago Mr. Johnston was the standard bearer of the Liberal party in North York against the present member, T. Herbert Lennox, and conducted a spirited campaign, being defeated by only a few hundred votes. He is a member of the York Pioneers, having many Indian and other historic relics in his home, and also belongs to Malone Lodge, A. F. and A. M., Sutton, and Sharon Lodge, Queensville. In patriotic and other work he took a leading part during the war.

His eldest son, George K. Johnston, who is now associated with him in business, served overseas as a member of the Princess Pats, enlisting in September, 1915, and receiving his discharge in March last. He was severely wounded at Courcellette, a bullet going through his left arm and chest. This resulted in his being confined to the hospitals in France and England for some fourteen months. After his recovery he rejoined his corps and was in every fight in which they were engaged from Amiens to the capture of Mons. Another son, Robert, is in charge of the planing mill, while Mr. Johnston has two other boys, who will no doubt become lumbermen when they attain manhood's estate.

Changes Wrought by Father Time

Naturally Mr. Johnston has witnessed much development in the lumber business, and he well remembers as a boy when the Black River was filled with hewn timber on its way to the eastern markets. He has seen hemlock lumber sold at the mill for five dollars per M, and today it is nine or ten times that figure. He is an ardent supporter of afforestation, which, he believes, should be vigorously prosecuted by the government to ensure the perpetuity of our forest wealth, and as a measure of national conservation and thrift. It takes too long for coniferous trees to reproduce themselves in the lifetime of the ordinary individual, and as succeeding generations will reap the benefit of a progressive forestry programme, such work should be conducted in their behalf. In front of his home Mr. Johnston has a fine row of spruce trees, which he planted twenty years ago, thus giving practical evidence of the faith that is in him in the matter of silviculture.

How Workmen's Compensation Act Applies

Satisfactory Results That Have Been Brought About Through Its Administration in Sawmill and Logging Activities of Ontario—Safety Work Progress

By Frank Hawkins, Ottawa, Secretary of Lumbermen's Safety Association*

Frank Hawkins, Ottawa, Ont.

It is no longer necessary to apologize for safety work nor to explain what safety work means. It not only counts for the amelioration of suffering—the humanitarian bond of sympathy between the injured and those in a position to help—it counts for increased efficiency in the workshop or mill, and efficiency means increased production of better goods for less money, which in the last analysis means a larger opportunity to compete in the world's markets, in other words that "Safety is a paying proposition."

I think every one will concede this to be the case.

The question, therefore, resolves itself merely into one of method: that is of law and its administration.

When Mr. Price invited me to address you he suggested the subject: "Accident Prevention in Canadian Woodworking Plants."

In Canada we have our Provincial Workmen's Compensation laws just as you have here in the United States. The Association with which I am connected is the Lumbermen's Safety Association of Ontario. I therefore speak only from the point of view of that Province, and of our particular group. Class 1, which embraces lumbering, sawmills, manufacture of veneer, excelsior and cooperage stock, lumber yards in connection with mills, creosoting of timber, and kiln drying of lumber.

A further explanation is due to you in that our group does not take in woodworking factories. We have 34 classes or groups of industries operating under the Workmen's Compensation Act of Ontario.

It is reasonable to believe that comparison of laws and their administration adopted by various states and provinces may be of practical value. This is my apology then for referring only to the Ontario Workmen's Compensation Act and to Class 1 thereunder, in the hope that other papers presented at this Conference may, by inviting comparison and discussion lead to betterment in law and administration.

The Workmen's Compensation Act of Ontario came into effect the first of January, 1915, and at that time could only be regarded as legislation of the most advanced type. It completely abolished common law rights in so far as damage suits for accidents are concerned; it vested arbitrary powers in a commission appointed by the provincial government from whose ruling there is absolutely no appeal. It exempted railways from the operation of the act under schedule one, putting them in a separate class, together with Dominion Telephone, Telegraph and Express companies, Municipalities, etc. The whole cost of awards made by the Commission is payable out of the group funds contributed by each industry. The industries also pay a large proportion of the expenses of administration. Whether or not this whole subject of compensating the injured is a matter for Federal rather than State or Provincial legislation is a subject which might easily be considered in the near future.

The Protection of the Bread Winner

It is to be conceded that where the bread winner is incapacitated through accident some form of compensation is due not only for the injured himself, but in order to relieve suffering and want on the part of his wife and children or other dependents. From the point of view of the workmen, legislation of this character is much to be desired because under the old law he had to prove negligence on the part of his employer, otherwise he had no right to recover damages. If through negligence he contributed to the accident or if he

were injured through the negligence of a fellow employee, or had he assumed the risk of the employment he was barred.

Under the old law if the employer and employee did not agree upon a settlement the remedy was an action in court. This meant long delay, annoyance, and great expense to one, or both of the parties, and, with the technicality and complication that prevailed, much uncertainty as to the result. The ordinary workman or his dependent widow shrank from such a proceeding or feared the danger of an appeal, or perhaps had not the money with which to proceed. Upon the other hand employers often suffered from vexatious litigation by irresponsible claimants. Under the new law, with its simple provisions and methods of procedure, settlements are made expeditiously and without expense to either party, and payments go direct to the person entitled.

On the other hand the employer was forced to defend all suits, with the possibility of a court judgment that might mean practically ruin and the consequent ill-will of both employer and employee. The employer is now relieved from all anxiety on this score as he can neither sue nor be sued for damages.

Representations made by the Lumbermen's Safety Association with regard to the Safety Associations being recognized by the Board as representing the respective groups of employers have been acknowledged, and favorably considered.

Adoption of Current Cost Plan

The Association has also urged the necessity that an appeal to some judicial tribunal should be had on certain general principles. We do not seek to appeal to such tribunal on the matter of awards made by the Board. This suggestion, however, is opposed by the Board as they are not prepared to recommend legislation of this character.

A recent amendment to the Act includes clerical employees, and on and after January 1, 1920, their salaries will be assessed just in the same way that the workmen are included. In similar fashion an employer or partner, or executive officer of any company, or a member of his family, if employed by the company, may be covered in precisely the same way as the workman by including a reasonable amount as salary in the pay roll, and so notifying the Board.

Another recent amendment increases pensions for widows and children. On April 24, 1919, a widow's pension was increased from \$20.00 to \$30.00, with an increase from \$5.00 to \$7.00 for a child, the maximum for all dependents being from \$40.00 to \$60.00 per month.

We have persistently urged against the building up of large reserves to provide for deferred liabilities and the Board has abandoned their former position in this regard. In other words, the Current Cost plan is now practically adopted by the Board. When it is considered that under the Act the Board may assess upon all industries or any one industry for any amount, and as often as the Board may deem fit, the necessity of building up large reserves is not apparent.

Merit rating also is a settled policy of the Board. A workman cannot contract himself out of the operations of the Act.

Medical aid must be provided for as long as is necessary and an employer is prohibited from collecting any sum from any employee in any way toward medical aid; nor can any doctor collect anything from the workman for services covered by the Act. The employer must also furnish the necessary transportation for an injured employee to the doctor, the hospital, or the man's home. The cost of medical aid has added practically 15 per cent. to the amount of the assessments.

The gross revenue for the year (all classes) in schedule

1 amounted to	\$4,319,439.98
Expenditures	3,474,769.09

Leaving a provisional balance of \$ 844,670.89

The various classes may appoint inspectors to examine and report on industries within their group, and persistent failure to carry out the betterments suggested by the Inspector renders that industry liable to pay individually the whole amount of any damages awarded, at the discretion of the Board.

Last winter our Inspector visited a number of camps and, in addition to ordinary safety work, his inspection covered hygienic and

*Paper read before Annual Congress of National Safety Association held recently in Cleveland, Ohio.

sanitary conditions, also first aid to the injured. It is proposed to extend this feature during the coming winter.

The Average Rate and Disabilities

In the year 1918, owing no doubt to inexperienced labor, the number of accidents in Class 1, increased to 1,160 as against 975 in 1917. But the number of permanent disability cases was reduced in 1918 by seven, and of deaths by four, as compared with 1917; leaving 1,069 temporary disability cases in 1918 as against 873 in 1917. The year 1918 was the first full year where medical aid was in operation, there being 212 that received medical aid only—i. e., there was no compensation paid—so that it was impossible to compare this with only part of 1917, when there were only 63 cases in which medical aid only was given.

The average rate (over all industries) per \$100 of pay roll for the first year's operations in 1915 was \$1.64, subsequently adjusted to \$1.27; for 1916 the average rate was \$1.09; for 1917, 98 cents, which is expected to be still further reduced for 1918. The rates charged for lumbering operations are per \$100 of pay roll.

Sawmills \$1.60

Logging or lumbering 1.20

It is claimed by the Board that a full measure of compensation has been provided and every reasonable effort has been made to avoid imposition.

Where work is sub-let the principal is responsible for reporting to the Board and is to see that all assessments are paid, and all returns made to the Board.

In this condensed fashion I have endeavored to carry out Mr. Price's suggestion to give you some idea of the operation and also some of the results obtained in the application of the Workmen's Compensation in the Province of Ontario, Canada.

While industries do not agree with the commissioners on all

points it is only simple justice to say that the Board has administered the Act in a fair and impartial manner.

Labor, Capital and Public Service

We are finding out that the safeguarding of machinery, printing of bulletins, the holding of safety conferences, and indemnifying the injured is not the sum total of safety work. However estimable and just these things may be we must henceforth take a larger view of the human being. Our intercourse with one another now must be on the basis of "man to man." The old order has passed away or is rapidly passing. No longer may the arbitrary and overbearing manner of the capitalistic employer or the equally intolerant attitude of the labor agitator be able to hoodwink and deceive. An intelligent and fearless public opinion must enforce the rights of both capital and labor—it will supply the necessary ingredients whereby the wheels of progress may be efficiently lubricated and the great public service be uninterruptedly maintained. This is a great triumvirate: Labor—Capital—Public Service; and we must fully appreciate that what injures or affects one injures or affects all. We shall learn presently that a closed factory is a public loss, and the employer who interferes with public service by closing his factory must open it again at the public demand; and similarly the human factor must be brought to realize that the threat, "We will get 'ours'—or quit work"—will have to be replaced by something that will keep the workman at his bench, while at the same time giving him a contented mind and a fat pay envelope.

We must cultivate a community spirit between employer and employee—a spirit founded upon the rock of mutual confidence and esteem—every one must feel that the new order of things means justice and the square deal. This, I conceive to be a work for which the National Safety Council is eminently manned and equipped to perform.

Improving and Elevating Lumber Business

Reforms Which Have Been Brought About Through Branding and the Progress Achieved by Means of United Action of the Manufactures

However harsh it may seem to say it, there can be no doubt that less average efficiency in advance is shown in modern politics than can justly be said of the conduct of other or private departments of modern affairs. Another curious aspect may be noted in the fact that the industries in spite of the habitually obstructive attitude, meanwhile, of the government toward them, even to the extremity of menacing public safety, private affairs have sustained themselves with wonderful vigor, resultant profit and progress, says a writer in "Lumber." It means comparatively less average capacity and honesty in public than in private life. It ought to be "the other way round," but however humiliating the confession, that is not so. Guile, in other words is in larger degree an attribute of the legislator than of the average citizen in a position to contribute strength, character and stability to the industrial community than legislation, with all its defects, has made it possible to prevent or rob it of. This is not saying that all politicians are bad or that all business men are good. It probably is a fact that there are more bad men in both departments of life than they individually realize or appreciate.

Very few persons, men or women, physically repulsive know it; the same is true morally of men who, evidently, cannot see what makes them unattractive, or "as others see them." The mere presence of men of this latter ilk creates an atmosphere that no matter how adroitly concealed, to the man of the world is not hidden, but betrays itself. By the same token, it, too, is equally within the power of the discerning to detect the presence of the traits that beget confidence and attract, not repel, even strangers. Often when one encounters a man essentially base and accordingly also repellent, one asks himself if such a man can have any real sense of his true character, or how other men regard him? It is then that one judges that the man does not know because if he did he never would be guilty of thus consciously making himself so—his instinct of self preservation against inevitable personal injury would settle that.

Lumber Industry an Example of Advancement

The point sought now to be raised is that of showing, for example, how the lumber industry as a result of the leadership, without which co-ordination can avail nothing, has passed from a state of primitive crudity to its present highly developed, more refined eminence in point of efficiency and its success—compelling powers of achievement. The latter may have derived some part of its inspir-

ation from a sense of needed self-protection against aggressive, competitive service, but, if so, very good. This department of "Lumber" has more than once held and sought to prove that service is the best attribute of competition, because a form of rivalry infinitely better than mere slaughter of prices. The latter is like blood-letting; it weakens, strangles and, carried far enough, would plunge the whole fabric of business into a state, more or less, of bankruptcy. Prosperity derives its sustaining vitality from but one all essential fountain of energy, and that, as everybody with a spark of conscious acumen in his make-up knows, is profit. Take away or seriously impair profits and with the same certainty that disease depletes physical strength, business is impaired and prosperity droops. This is one of the self-evidently enduring because changeless business principles that even that vaunted aggregation of purity and wisdom, the Congress of the United States, has never yet discovered; plain and unmistakable as it is, this is the gospel of a truth members of Congress have yet to learn. Why? There can be no other reason than that they are less concerned about the welfare of the country than anxiety about the security of their own tenures of office, their privileges, "honors" and emoluments. It would be idle to attempt even an ample epitome of the processes and agencies by which the lumber industry has attained to its present status among the major industries of this country. For the purposes of this article and within the space available to that end, to trace a single example of progression and its companion refinements should suffice.

The Advent of Branded Lumber

The advent of lumber branding reform about three years ago at a meeting at Jacksonville, Fla., of the Southern Cypress Manufacturers' Association, has been called epochal until the phrase has become trite. But after all, a form of expression become trite is its own sufficient certificate of character—it has withstood the wear and tear of time and repetition. I don't know the extent to which the country over, branded lumber is to-day a full-fledged vogue, but while not the only available means of either gaining or keeping a reputation in need of no special certificate, it not the less on that account is a thing that, whether adapted or neglected by the individual, nobody has had the temerity to object to or seriously or consistently find fault with it.

Upon his introduction of the measure, J. F. Wiggington, as chairman of the committee in charge of the preliminaries, in speaking of

the motive prompting its purposes, or the sentiment that had inspired the movement, said in effect that there was not a member of the association who did not then know that cypress lumber occupied a particularly fortunate position in the lumber world, or one who did not feel that such position had its roots in the sincerity of purpose of members to harmonize their efforts in a manner to secure the best results consistent with the highest business principles. That was historical; a later declaration of principle was that the theory of the trade-mark brand is to build up a preferential demand based upon the collateral principle that its use would be that of "identifying it to the consumer." Right there is a kind of service that whether wholly competitive or partly altruistic signifies a refinement of business reciprocity than which it would be hard to imagine a policy or sentiment more salutary. Many a time, as the association records show, with some question of grading under discussion, the final vote would be determined by, not considerations of convenience, expediency or advantage, but the known wishes of consumers.

In the succeeding interval not only has the trade-mark with its attendant guarantees been perfected and, even by certain very large individual producers, but hand in hand with it have come other similarly judicious and public-spirited reforms now in force and effect in producing circles to a gratifying and supposedly a growing extent throughout the country.

Strongly Endorsed by Retail Trade

The whole subject, as now universally understood, has not only been endorsed by strong retail organizations, but by the same token manufacturers adopting it claim and no doubt believe that thereby to a very considerable extent, they have capitalized an asset consisting of well-earned reputations and by the same token serving to not only swell dividends, but a means of making business life morally worth living besides. It, more particularly, is held by adherents of the branding policy that there is no more doubt about the advantages of branding flour or any other commodity of high advertised standing than in branding lumber under like conditions. As already intimated, anybody can think of this proposition as he pleases; it is hardly thinkable that such or any other person would dispute the validity of it. Nobody has probably ever thought the operation of the protective principle involved would interest small purchasers, but apply only to sales and contracts too large to admit of personal selection or inspection. It, too, has been held a valid conclusion that objection to the theory wholly or in part, so far as its intrinsic merits are concerned, or without regard to possibly adverse individual interests, would, of necessity come from a class of competition unwilling from some cause to be bound by any such uniform code of self-imposed restrictions. It can be seen how an operator from any cause himself destitute of recognized standing or known to be in the habit of fraudulently mixing or otherwise arbitrarily lowering regular grades, could hardly be expected to take kindly to the restrictions under review. As declared by Mr. Wigginton at Jacksonville, the consumer, as a matter of equitable security of protection, is made a participating beneficiary, and in that particular factor, a spirit of comity is set up in the highest degree, commendatory.

Other Reforms Incidentally Akin

Simultaneously with the advent of, and in consonance with, the branding theory as against "anonymous lumber," other reforms have included sales of lumber to consumers, adulterating or lowering standard grades and other ethical or moral restrictions of abuses in earliest days rife throughout the trade. As, in some part, an epitome of the whole subject, a formal declaration by the National Retail Lumber Dealers' Association, adopted several years ago, will, in conclusion, not be amiss, as follows:

"This association hereby endorses and will support the efforts of all associations of lumber manufacturers which are devising ways and means for the branding of the product of their members and thereby assuring within a reasonable variation, the integrity of the grade as well as making possible the identification of the stock with consequent protection to the retail dealer and the consuming public.

"Be it, therefore, resolved that we stamp without approval the efforts being made by the various associations of lumber manufacturers to improve and elevate the lumber business by more careful grading and manufacture and that we in particular recommend the movement to hereafter brand all stock with the kind and grade."

Many More Houses Will Go Up Next Year

Altogether 93 municipalities have come under the Ontario Housing Act, including 18 cities, 43 towns, 18 villages, and 14 townships, while about 10 other cities and towns contemplate following their example. This means that all the cities in the province, with the

exception of two, will take advantage of the Provincial Housing Commission's scheme and practically all the towns.

Appropriations aggregating \$10,620,000 have been granted to 83 of the municipalities, and 70 of them are actually building. The others are developing their schemes and will put them into effect next year.

Windsor heads every place in the province with a building programme for 1919 of about 150 houses, while Hamilton, Oshawa and Niagara Falls are each constructing approximately 100 houses. Approximate figures for other municipalities are: Brantford, 30; New Toronto, 60; the Soo, 60; Ford City, 30; London, 20; Ottawa, 50; Paris, 20; Port Colborne, 30; Sarnia, 20; St. Catharines, 25; Sudbury, 30; York Township, 50; Iroquois Falls, 50; Hawkesbury, 50; Port Credit, 30. The whole of the houses at Port Credit are for returned soldiers.

"Next year," said J. A. Ellis, of Toronto, the director of the Provincial Housing Commission, "the municipalities contemplate erecting 4,000 houses at least. None of the other provinces, with the exception of British Columbia, has yet started actual building, so that Ontario is again the first province in the Dominion."

Windsor has the most ambitious scheme for 1920, planning to put up between 600 and 700 houses. Ottawa has already mapped out a scheme for the construction of 300 houses in the spring, every one of which is already taken. Niagara Falls contemplates erecting 300, while Hamilton can easily do the same.

The general average cost of the houses being erected in the province runs between \$1,000 and \$4,000 each.

Many New Uses for the Aeroplane

The Department of Agriculture at Ottawa has discovered a new use for the aeroplane. The Entomological Branch is investigating the mosquito in the Lower Fraser Valley in British Columbia. By using the aeroplane, the country can be surveyed in order to map out the swampy areas and other breeding places that are readily located in photographs taken from over head, according to a statement by Dr. C. Gordon Hewitt, Dominion Entomologist, that appears in the October Agricultural Gazette. The aeroplane was used in making a comprehensive survey of the complicated water system of the Fraser River and the adjacent bodies of permanent and temporary water in that district. A flight reported by Dr. Hewitt has demonstrated the possibility of using this machine also for making surveys of timber that is being killed or has already been destroyed by various insects. Its use, it is believed, will help very greatly in the entomological work with various insects being carried on by the Federal Department of Agriculture.

Veteran Lumberman Celebrates Golden Wedding

Mr. R. E. Jameson, who spent many years in the lumber business, and his wife recently celebrated the 50th anniversary of their wedding at the home of their daughter, Mrs. J. E. Davis, 845 Logan Ave., Toronto. The venerable couple are still in excellent health and were the recipients of many tangible tokens of esteem. Mr. Jameson is 80 years of age and was born in Waterloo County, while his wife (Miss Charlotte Eakins) was born in Oxford County 72 years ago. They were married at Eastwood October 27th, 1869. Mr. and Mrs. Jameson have a family of three children and two grandchildren.

Mr. Jameson, who retired from active work about ten years ago, is still a man of abounding good health considering his advanced age. He operated a saw-mill at Lynden, Wentworth County, and afterwards in Culross Township, Bruce County. Later he conducted a planing-mill in Blythe. He then came East and resided in Trenton for many years and ran saw-mills at Bannockburn and Gilmour as well as conducting extensive timber operations in Hastings County along the Central Ontario Railway. Subsequently he owned a number of portable mills in that section of the Province until his retirement. Mr. and Mrs. Jameson have been residing with their daughter, Mrs. J. E. Davis in Toronto during the winters and spend each summer at Oakville, Ont.

Mr. Jackson Will Remain in Bay City

George D. Jackson of the Little Current Lumber Co., who has been manager of the Little Current Lumber Co., Little Current, Ont., whose mills and timber have been sold to the C. Beck Mfg. Co. of Penetanguishene, will not be connected with the new organization in any way. Mr. Jackson will devote all his time and attention to the Little Current Lumber Co.'s interests in Bay City, Mich., of which he is sec'y-treas., and many Canadian friends will regret his absence from operations in Ontario. The Little Current Lumber Co.'s equipment consists of a double-cutting band saw, Wickes Bros. gang-saw, together with a full complement of edgers and trimmers. About three years ago the Little Current Lumber Co. built a new lath mill and it is a very nice plant.

Character and Not Money Builds Business

Senator Edwards Declares Every Successful Lumberman of Ottawa River Started with no Capital Except Courage, Honesty, Industry and Endurance

Hon. W. C. Edwards, Ottawa, Ont.

Hon. W. C. Edwards, head of W. C. Edwards & Co.; the widely known lumber and woodworking firm of Ottawa and Rockland, Ont., was recently honored by the residents of the latter prosperous community on the occasion of the golden anniversary of the establishment of the Edwards mill in that town of which the veteran Senator is the father.

The occasion was a significant and memorable one from various standpoints and the tributes paid to Mr. Edwards were warm and sincere. He was presented with a handsome oil portrait of himself accompanied by an appreciative address which said in part:

"It is interesting to note that many old employees, some of whom came as mere lads when the business was first started, still

remain in the service of the company, a silent tribute of their belief and faith in you, sir, and the other members of your firm. While we stand today among surroundings which are largely the outcome of your perseverance and ability, we recognize the fact that such results were not gained easily, but only after many reverses, which might have discouraged most men, were overcome."

The recipient was deeply touched by the evidences of affection and esteem in which he is held by the four thousand residents of Rockland and, in his reply, gave a graphic and interesting sketch of his early struggles and the remarkable expansion of the industry of which for over half a century he has been the guiding spirit. The Senator who is in his seventy-sixth year, has risen from the ranks in the lumber industry in which he has spent all his life. He recounted many stirring and timely incidents in his career and referred to the cordial relations which had always existed between his employees and the firm. Mr. Edwards has courage, optimism, perseverance and energy. These were his great outstanding assets and how he overcame many barriers and won his way to the front is narrated in his story which follows:

November 8, 1918, marked the fiftieth anniversary of the com-

mencement of operations of the firm here, for it was on the 8th day of November, 1868, a cold, bleak morning, that I embarked on the old steamer Carolina of the Ottawa Forwarding Company at Thurso, where I had been formerly employed, and debarked at what is now the town of Rockland. You have today, I understand, a population of about 4,000 with well maintained streets, concrete sidewalks, three churches, three school houses, one of them a High School, numerous stores and shops and many comfortable homes, the greater number of which are the private properties of the employees of the firm. This is a result arising from the fact that several years ago the firm made a survey of a considerable portion of its property and building lots were sold to the employees at nominal prices, and lumber was supplied at a low cost and on easy payment to facilitate houses being built.

The firm also built a very considerable number of houses, which have always been supplied to actual employees at a nominal rental. So that with the two sawmills of existing proportions and the number of men employed not only here, but in Ottawa and other places, it must be admitted that great progress and development have been made, for the contrast is very considerable.

On a Bleak November Morn

To illustrate: I arrived at McCaul's Point, which is now Rockland, that bleak November morning alone. Two families were the only occupants at the time, the James McCaul and the Way families. These two small families composed the entire population of the immediate locality. The tools I carried with me on the steamer Carolina were two pick axes and three spades. The first employees were William Way and Magloire Lariviere, and with my own hands and their assistance I dug and prepared the foundation for the first mill erected in Rockland. The erection of the frame of the mill was carried out by contract with James Erskine. The machinery was obtained in Montreal and Ottawa, and the mill went into operation in May, 1869. The total quantity of lumber cut that season was 3,000,000 feet—a very small quantity as compared with the production for many years past. The results of the operations of the company have placed it among the very limited few who have succeeded in the lumber business on the Ottawa, as compared with the very large number who have failed of success. The fact is that only from three to five per cent. of those who engaged in lumbering on the Ottawa have been successful.

None of those who have succeeded began with what is popularly known as capital; namely, money. In every instance the successful

General view of the lower mill of W. C. Edwards & Co. at Rockland, Ont., affording some idea of the extensive character of the industry founded fifty years ago. This is known as mill No. 1, and in the distance can be seen Mill No. 2.

lumbermen of the Ottawa river, past and present, embarked in the undertaking possessed of no capital whatever, excepting their individuality, composed in greater or less degree of physical and mental capacity, courage, determination, industry, endurance and economy; together with a practical knowledge of the business; and, last but not least, the quality which brings confidence and credit, namely, character and honesty of purpose. For, after all, these are the qualities which are the basis and mainspring in all the business of the world, and are the major portion of the capitalization of the industry.

More Than Mere Money Required

So-called capital, composed of an article popularly called money, cuts but a very small figure, relatively; and no amount of it will ensure success in lumbering on the Ottawa without the vital qualities I have named.

I think that I may fairly claim that the general testimony would be that I possessed in greater or lesser degree the essential qualities

uted among mankind, is a most unhappy fallacy and delusion. The property and labor of the world constitute its wealth, and with abnormal cessation of labor, property soon loses its value.

Labor is Great World Wide Factor

Actual money cuts a very small figure in the world's affairs. Labor is the great factor in the production of the world's necessities, and confidence and credit are the mainspring and primary foundations. The present aspect of the world's affairs is all in the direction of a most serious limitation of production, and the positive destruction of confidence and credit; and with the wheels of production and commerce thus clogged there can be but one outcome, starvation.

It is true that this very unhappy condition is greatly more aggravated in Europe than in the United States and Canada, but the insidious impression has been transported and permeates this side of the water, to a certain extent, but perhaps less in Canada than in the United States, and certainly less on the Ottawa river than in many parts of Canada. It is remarkably absent as between your good selves and the firm of W. C. Edwards and Company. For here you are today giving testimony of the fact that for a period of over 40 years the best of cordial and amicable relations have existed between you and your employers in a most singular and exceptional manner.

The portrait in oil, which was presented to Mr. Edwards, was painted by G. Horn Russell. It is a head and shoulders picture, splendidly executed and attractively framed, and Mr. Edwards has the appreciated gift hung up in his beautiful home in Ottawa.

The reference to the jubilee of the Rockland mills has been held over for some time by the "Canada Lumberman" in order that illustrations might be presented of the historic plants. It took several days to secure these and it is a pleasure to present in this number views of the busy industries which have been built up through the energy, foresight and vision of Hon. W. C. Edwards and his associates.

Company to Specialize in Railroad Supplies

A charter was recently granted to the T. M. Partridge Lumber Co. Limited, Rainy River, Ont., which was formed for the purpose of taking over the interests of T. M. Partridge of Minneapolis, Minn., who has operated in the Rainy River district for several years. The officers of the new company are President, T. M. Partridge and Secy.-Treas.; H. F. Partridge, Minneapolis. The timber limits of the organization are situated in the wild land Indian reserve and also on the Lake of the Woods in the vicinity of Rainy River. The company propose to produce white cedar poles, posts, piling, tamarac ties and piling and other railroad supplies. The output will be marketed in the western provinces of the Dominion where an extensive business has already been developed. The company anticipate selling the saw timber produced from their lands for the present, although there is a probability of constructing a mill at Rainy River if conditions in the future warrant doing so.

Heavy Lumber Imports from B.C.

During the first eight months of the present year an aggregate of 760,554,000 board feet of lumber has been imported into the United States, duty free, from various foreign countries. Nearly all this comes from British Columbia. This is an average of approximately 95,000,000 feet per month.

The volume of lumber imports, according to the monthly reports of the bureau of foreign and domestic commerce, has been increasing from month to month, since the first of the year.

For the month of January the volume of boards, plank and other sawed lumber imported into the United States was 54,241,000 feet, besides 10,688,000 pieces of lath and 137,818,000 shingles.

By March the lumber imports had increased to 66,362,000 feet and lath to 15,480,000 pieces while shingle imports had dropped for that month to 97,843,000.

In May the lumber imports went up to 155,644,000 feet, lath to 46,124,000 pieces and shingles to 229,271,000.

The August imports were 139,742,000 feet of lumber, 24,832,000 lath and 194,548,000 shingles.

The average monthly imports of lumber during 1918 were approximately 100,000,000 feet, of lath 50,000,000 and of shingles 140,000,000. All came in duty free.

A district logging engineer with headquarters at Missoula reports that he has seen cedar trees more than 2,000 years old, still alive and growing in the Kaniksu forest which is in the extreme northeastern corner of Washington. "These trees," says the engineer, "varied in size from a foot to ten feet in diameter. I used a boring instrument on them and found that the trees were in all cases 2,000 years old and some of them nearly 3,000. The wood is firm and is a potential source of high grade timber."

View of Mill No. 2 of W. C. Edwards & Co. at Rockland, Ont.
This is sometimes known as the Upper Mill

for success which I have named, and that to my efforts and constant hard work is due a reasonable share of the success of the company.

But, no matter how constant, energetic and skilful I might have been, how helpless I would have proved in my efforts toward what has been attained without the helpers and the laborers who have been my constant aid in each department of the undertaking.

For many years I worked side by side with the employees of the firm, for there was no department of the work in which I could not and did not engage with my own hands, from the cutting and hauling of the logs in the woods to driving the streams and manufacturing and shipping the lumber, and there was no employee in any single operation of the business in the woods, on the river, in the mills, boiler houses or engines, whose place I could not fill, and did not fill for days and weeks at a time on very many occasions. At no time in my business career have I ever asked an employee to do anything whatsoever that I would not do myself.

This very close intimacy with the working man and his work instilled in me the greatest possible regard for honest labor, and throughout my life there never has been a time I would not go farther to take off my hat to greet an honest conscientious workman than any other class of any community, from the highest dignitaries in the land downwards, and none it gives me greater pleasure to meet than a worthy old employee.

Sixteen Hours a Day for Him

Changes that have taken place are in the reduction of hours of work, which have been greatly lessened. No lessening of hours could take place in the operations in the woods, for the reason that in the northern latitude in winter we have but a few hours of daylight each day. It was not 10 or 12 hours a day that I worked, but, for the greater part of my life, 14 to 16 hours.

The war is over so far as the destruction of human kind is concerned, and the world will recover. But certainly not on the basis on which it is now operating. Now, what is the remedy? None but the following—to labor, produce, economize and trade. In due course, and before we are much older, the world will starve for both food and clothing if present conditions continue. The former wealth of the world was made by producing and trading, and the remedy for the present most unfortunate condition cannot be accomplished by any other means. Two further factors for the enrichment of the world would be disarmament and general prohibition, and, if, in addition, world free trade were proclaimed and put into effect, mankind would prosper as never before, and the peace of the world be guaranteed.

The unfortunate popular idea that there are amassed enormous fortunes, in an article called money, that can and ought to be distrib-

Reducing Accidents in Logging Operations

The One Remedy that is Certain Preventative is Carefulness—Specific Instructions on Various Methods of Work and Use of Equipment

By James Boyd*

Logging operations procure the source of supply for the lumber manufacturing plants. Accidents happen, but in most instances they result in minor injuries. It is rare that many men suffer injury at one time, because as a rule they work in groups of two or three. Still, one operation reports 183 personal injury cases in 1918.

The best statistics on the subject have been prepared by Henry Burr, Vice-President of T. H. Mastin and Company, Kansas City. The experiences of this organization over a series of years, which insures lumber companies only against liability and workmen's compensation, is that 39 per cent. of all accidents in lumber operations are in the logging department of which 21 per cent. are in the woods and 18 per cent. on the logging railroads. The cost of the accidents in the logging department is 21 per cent. of the cost of all the claims in the lumber industry and that in the railroad department is 20 per cent., or a total of 41 per cent. of the entire cost of personal injury.

Mr. Burr has prepared the following figures showing causes of accidents in percentage to the total number of accidents reported:

	Per cent.
Log cutting	45
Skidding by power	15
Loading by power	18
Skidding by animals	2
Loading by animals	3
Hauling by animals	8
Swamping	4
Unclassified	5

In the operation of the logging railroads the following causes contribute in the percentage shown:

	Per cent.
Operation of cars	26
Maintenance of way	46
Unloading logs	8
Accidents in pond	5
Coupling cars	4
Boarding and alighting	4
Unclassified	3

Bulletins of the National Safety Council have done good work in lessening the number of accidents in operations where they have been used. A company began posting bulletins in 1916; that year it had 272 accidents; in 1917 the number was 225, and in 1918, 183.

Those companies which do not change men often have few accidents. Some of them avoid putting green men in places where there is a possibility or likelihood of an accident, using the new men in places where there is not a great deal to be done, and practically no risk, until they become sufficiently acquainted with the requirements of the work so they can throw around themselves the necessary precaution. Others employ only competent men, and require those in charge of operations to keep a careful watch over their men and see that they take no unnecessary risks.

The Choctaw Lumber Company, Broken Bow, Okla., maintains a Welfare Department under the direction of J. W. Clark. Part of the duties of this department relate to a reduction of accidents. Each employee is given a small book which gives directions for the prevention of accidents. Here are the instructions for the Woods Operations:

Open Letter to Woods Foremen

1. Instruct every man who is new in your crew regarding his duties and point out to him where he may meet with danger. New men are more liable to accident.
2. The axe and the saw teeth are the cause of most minor injuries to logging men. Keep this idea before your men.
3. Falling trees with the cutters is the cause of most all deaths from accidents in the woods. Keep the men on the lookout.
4. Catching logs on the move injures men and may cause death if the cant hook should fail. Stop this practice; some one on POLLY the year 'round from this carelessness, two at the present.
5. Keep the safety idea before your men all the time and make a record for your crew.
6. Co-operation among the men in the woods, as the swampers

and the teams, the saws and the haulers, and the men and the foremen, is of absolute importance; foremen see that this condition is maintained.

7. Men who refuse to use ordinary precaution among their fellow workmen will have to be replaced.

8. Keep the women and children in mind when you think of Safety First and it will be easier.

Open Letter to Workmen in Woods

1. We have a desire to see every man on his feet and making his own way in the world and wish to help you.
2. Carelessness causes 90 per cent. of the accidents of industry. Cut out your part of the carelessness and you have done your part.
3. The axe, the saw, and the falling tree are the arch enemies of the woods department.
4. Always strike with the axe aimed out and from the body and there can be no injury with the axe.
5. Don't treat the Safety idea lightly; it may save your life and keep your children from being orphans.
6. A crippled man is not a man; he is only part of a man. Be a whole man.
7. Industry needs every man of us. Let's work together that all may be happy.
8. We have SAFETY FIRST rules now and I am asking every one of you to co-operate with each other and with the foreman to make your department free from injury. We should all be better for the rule.

Mr. Clark publishes a monthly paper as part of his work. Following is the "Safety First Department" from a recent issue:

The Safety First Department

The accident record for the month is very good. One hand badly hurt in the Bismarck planer mill, due to "carelessness and awkwardness," as the injured man puts it. It might have been a wrist as well as the two leaders in the hand. Be on the lookout at all times and stay away from danger.

The new floor in the machine shop is a much needed improvement and will aid in preventing accident. Uneven floors are dangerous.

W. L. Douglas was hit by a falling limb at Broken Bow camp. This is a type of injury that can't well be avoided at times. Eternal vigilance will help.

One man injured at each camp by axe cuts. These appear too frequently. The foreman should point out this danger and then the men should quit chopping toward the feet; chop out from the body and you can't cut your foot. It will take more time to do this, but it will save you a foot, perhaps.

The cleanest place on the job is the car shed of the Bismarck car repair men. These men could keep a house neat and orderly.

A health pamphlet and a safety first pamphlet will be sent to each working hand this week. Read these and then take them home and keep them. I have done several weeks of hard work in preparing them and I know the material they contain is authoritative. We mean to send much of this to your home and ask you to keep it and try to get good from it.

The one remedy that is a certain preventative of all accidents is carefulness.

Louisville is After New Industries

The town of Louisville, P.Q., is anxious to secure additional industries. The Tourville Lumber Mills Co. have a very fine saw-mill in the town, manufacturing over 20 millions feet of lumber, mainly for export. The town offers a bonus to any company which will locate there and which can offer guarantees. The population is 2,000, with 1500 in the vicinity, and a good supply of labor is, we are informed, available. The town is on the C.P.R., 20 miles west of Three Rivers, and is situated on a navigable river. All particulars can be obtained from the mayor.

*Paper read before National Safety Council at eighth annual Congress held recently in Cleveland, Ohio.

What Aggressive Yardmen Are Saying, Doing and Planning

Progressive Retail Lumber Merchant of Quebec

L. Hamel, Quebec City, Que.

L. Hamel, who was recently elected Vice-President of the Quebec Retail Lumber Dealers' Association, is General Manager of the E. T. Nesbitt Regd. and is one of the most progressive citizens in the ancient capital. Mr. Hamel spent some twenty-two years in the employ of the late Mr. Nesbitt, who died two years ago, and became proprietor of the business in May last. Born in Quebec in 1875 he showed an aptitude for business at an early age. After completing his education, he entered the service of E. T. Nesbitt, and the expansion of the business of late years has been very satisfactory. The capital stock has been increased many times and the annual turn-over is now exceptionally large. The company employ about one hundred men and has shown initiative, courage and aggressiveness. Mr. Hamel was elected a director of the Association of Contractors at the beginning of the present year and has always taken a deep interest in the welfare and uplift of similar organizations. At the last municipal elections he was made a member of the city council, representing Limoilou district, and, possessing public spirit, business ability and thorough knowledge of the needs of the community, Mr. Hamel has proven himself to be a live representative. He is a member of St. Jean Baptiste Society and interested in several benevolent bodies. Of an agreeable personality and pleasant manner, he makes friends on all sides.

The planing mill and factory of the company, of which he is at the head, are located on the 10th Ave. Limoilou Ward. The company manufacture sash, doors, mouldings, boxes, etc., as well as deal in lumber and also carry on considerable construction work making a specialty of wooden buildings. Mr. Hamel has always been an ardent supporter of organization and all get-together movements and is enthusiastic over what has been accomplished by the Quebec Retail Lumber Dealers' Association since its inception nearly three years ago.

Effective Advertisements for Retail Lumbermen

The Long-Bell Lumber Co. of Kansas City, Mo., who are wide advertisers of trade-marked lumber, not only believe in live publicity for their own product but also in co-operating with the buyers of Long-Bell lumber in making the demand for this line more active and aggressive. The latest move on the part of the Long-Bell Lumber Co. is to institute an attractive advertising service for retail lumber dealers and circulate several thousand copies of a neat booklet containing striking advertisements. These are gotten up in convenient sheet form and the one, two or three column cuts are supplied by the company free of charge. All that the advertiser has to do is to write away for the cuts and hand them over to the local newspaper publisher along with the accompanying reading matter, which may be changed to suit the particular needs or special purposes of any retail lumberman.

In connection with this service the Long-Bell Lumber Co. sample advertisements which have been prepared by their advertising department will be found of much interest.

One paragraph alone sets forth the object of this new feature and here are the words:—"Every lumberman is well aware of the wonderful power of advertising. It is the most stimulating element in business to-day and there never was a time like the present to put the merits of one's goods before the buying public. These are prosperous times. "Build Now" campaigns, "Home Owning" campaigns, reasons for the necessity of better farm equipment, etc., have covered the nation. The building idea is strong and growing and a little local boost to the movement on your part is bound to show real and tangible results."

How Retailer Should Write His Ads.

A lot of you are going to stop right here and say that this is a foolish thing to write about because you have nothing to sell.

Grant that—just to avoid argument—but this title still holds good. Note that it is on the writing of ads., says J. C. Dionne in the "Lumber Co-operator."

Perhaps it hasn't struck some of you that the first step in writing an ad is to have something to write.

Many of you have filled newspaper space with words—but how many ads did you ever write?

Olendorff could converse in French about the straw colored cat of his aunt, but that wasn't a particularly interesting subject for many people.

You can mention "Wood, Cement, Lime and Coal," but that doesn't give much food for thought to the man who has a maple floor or a hen house in mind. Chances are he doesn't even think of what those things he wants are made of.

Before you write "an ad" you should know thoroughly two things—at least—and those are 1st, what you have to sell, and 2nd, how that thing will benefit your reader.

And if your ad doesn't contain the answers to those two points, your ad is worse than wasted.

So then, when we speak of the "writing of ads," we speak of the preliminary work of "getting ready to write the ad."

Just go over what you have to sell; even if you don't write a single ad, that investigation will be of value to you, for it will show you a lot of things you didn't know you had.

How about stock? Plenty? What kinds and amounts? What sorts of things can be made from that stock? How about prices? How about conditions? Any special grades or species or materials?

Then how about Service? Deliveries? Accounting? Credits? Plan-book services? Information? Construction aids?

How about your office? Pleasant? Clean? Suggestive Displays?

These are a few of the first and main things to consider.

List then—answer them—and the first thing you know you'll find the best ads you ever wrote lying on the paper in front of you.

It's a great indoor sport these days. Give it a whirl.

New Retail Firm Starts Operations

Carl Sorensen & Co. of Port Arthur, have begun operations in the logging line in the vicinity of Fort Frances, where the firm have a large block of timber land, which is adjacent to the Canadian National Railway. It is the intention of Mr. Sorensen to erect a saw-mill at a convenient point for the purpose of cutting the logs, which will be shipped to Fort William. The company will also take out large quantities of cedar posts, for which an unlimited market exists in Western Canada.

Mr. Sorensen was for many years connected with the Shevlin interests in Minnesota and Dakota, coming to Port Arthur some eight years ago and establishing the Lakeside Lumber Company, which he disposed of when the war broke out. During the past two years or so he has been secretary-treasurer of the Terminal Land and Investments, Limited, owners of large real estate holdings in Fort William and Port Arthur.

It is the intention of the firm of Carl Sorensen & Co. to establish a lumber yard at Fort William and find a market for their lumber in both cities. In addition to cutting on their own behalf, they have placed contracts for large quantities of lumber with contractors, so that when they are ready to begin business in the two cities next spring, they will have full stocks of building material.

Lumbermen's Organizations Will Hold Annuals

Arrangements are being made for the annual meetings of the various Lumbermen's Associations. That of Wholesale Lumber Dealers' Association, Inc., will be held in Toronto on January 9th, and the Lumbermen's Credit Bureau annual will be on the same day. The Lumbermen's section of the Board of Trade will meet and elect officers for the coming year on January 2nd. The annual convention of the Ontario Retail Lumber Dealers' Association will be held in Hamilton during the early part of February. It is likely that a two days' convention will take place and the dates will be announced later.

The Busy Retailer and Some of His Present Day Problems

Selling Lumber by Use of Telephone

Do you make good use of your telephone in getting after new business or simply wait until you hear it jingle, and then take what ever orders come in over the line. There is no reason why the instrument should not be made to do service for the retail lumberman for, by its use, he can get in touch with many customers and prospects, not only in his home town but in the surrounding country.

The telephone opens up numerous avenues of new business when rightly employed and should prove a splendid result producer. Its possibilities are almost unlimited and yet, in many offices it is a thing quite outside the actual reception of orders or listening to inquiries. It should serve as a salesman and can be used to advantage on divers occasions and with effective results. The best way to find this out is to make a systematic and persistent effort and see what business can be brought in through its agency, intelligently directed.

It is especially important that telephone selling be done at opportune times.

Take the case of the dealer who goes after farmers' trade. Any old time of day is not always a good time to call up a farmer—as illustrated by the dealer who called a farmer at ten o'clock one forenoon. The farmer was not very far away from the house—but he was very busy in the field. When he finally came to the telephone, Mr. Dealer got an eye-opener.

"Do you realize," said Mr. Farmer, "that farmers are mighty busy in the fields this time of year and a half hour in the field at this time of day is worth a whole lot more to me than coming to this telephone and chewing the rag with you about my future lumber requirements or building intentions."

That wasn't all that Mr. Farmer said but when he had finished, the dealer had learned that noon, night or stormy days are surely the best times to telephone farmers about goods you do not definitely know they are in the market for.

It is a good plan to study your customers and time your calls. Decide when they are most likely to be in need of your merchandise, then call them where there is the least chance of their being busy. Results are apt to be especially good on rainy days, when outside farm work is slack.

A dealer once figured that before he placed his orders for fence posts, it would be a good scheme to get a line on the probable requirements of his trade as this might allow him to buy enough posts to get a quantity price. So he called up a list of forty or fifty farmers one day, told his proposition and was happily surprised to get enough orders to make two carloads.

This instance points out another very important requirement in telephone salesmanship.

Always have a good reason for calling up.

It is not wise to call up in a general way and merely ask a party if he wants anything in your line. Have one or more definite items to suggest or offer.

Sometimes it is best, of course, to offer the conversation along general lines to warm up a customer—like the dealer who called up the farmer who was road commissioner in the town. He first asked him for some road information and complimented him on a new piece of road. Finally the object of the call was stated and a sale was made easily.

The average lumberman constantly has numerous opportunities to make his telephone one of his best business builders. Besides making direct sales, it affords him a wonderfully efficient way to keep in close touch with the building intentions of his trade—and that is the best developer of new business.

Of course there is nothing equal to the personal call to convince a customer of the merchant's real interest. But the telephone is the best substitute.

Business Good in Georgetown District

J. B. Mackenzie of Georgetown, Ont., who is secretary of the local retail lumbermen's association, states the annual meeting will be held about the middle of December for the election of officers and for a review of the business of the past session. It is also expected that problems arising for the coming year will be discussed and considered. Mr. Mackenzie reports that the building trade has been good in his district and that the prospects for its continuance are bright as should building operations ease up in towns, farmers have a great many repairs to make which have been deferred by lack of skilled help.

Public Spirited Lumberman Who Gets There

R. H. Spencer of Trenton, Ont., is a gentleman widely known, not only in lumber circles but also in the ranks of Masonry particularly in the Eastern part of Ontario. He has been associated with Gill & Fortune, lumber merchants of Trenton, ever since they bought out Messrs. Gilmour & Co.; nearly fifteen years ago, and has had full charge of their accounting. Before that he was with the Gilmour firm and previous to that was chief accountant of the Central Ontario Railway for seventeen years. This line is now part of the Canadian National system. Mr. Spencer is a progressive citizen and finds time, outside of his active business duties, to serve his fellows as a member of the Town Council, and as secretary-treasurer of Board of Education.

R. H. Spencer, Trenton, Ont.

In Masonry he has always been a leading light and his record in the craft has been one of advancement and devotion to duty. This was recognized at the annual meeting of the Grand Chapter, R. A. M. in Toronto in June last when he was elected Grand J. He made his first acquaintance with the craft in 1893 when he was initiated into Trent Lodge No. 38 of which he became Worshipful Master four years later. He was D. D. G. M. of Prince Edward District No. 13 in 1909-10, and was exalted in St. Marks Chapter, R. A. M. No. 26 in 1895, becoming Z of the Chapter in 1903. R. W. Bro. Spencer was Grand Superintendent of Prince Edward District No. 11 in 1905 and for many years has been on the Executive Committee of the Grand Chapter. He is also a member of King Baldwin Preceptory, Knights Templar, No. 6, Belleville, and during the past year was Grand Constable of the Sovereign Great Priory of Canada. A member of Remeses Temple Mystic Shriners of Toronto, he is an indefatigable worker in any line to which he directs attention. Mr. Spencer was born in Camden Township, Addington County, and was educated in Newburgh and Napanee, and started his career by teaching a rural school.

Eastern Company Had Good Season

A charter has been granted the E. C. Atkinson Lumber Co. Limited, with headquarters at Gagetown, N.B. The officers are: President and Treasurer, E. C. Atkinson; Vice-Pres., Peter Mahoney; Secretary, Abner B. Belyea. The extent of the company's operations include a cut this year of 4,000,000 feet of lumber, 2,000,000 feet in the parish of Southampton, York County, and 2,000,000 feet in and around Gagetown, Queen's County.

The Atkinson Lumber Co. are also operating one stationary mill at Southampton, and a portable mill near Gagetown. They have timber limits, leased and soil right, and also standing timber to the extent of 1,000,000 feet, and have about 25,000,000 feet more under option. The company are associated through their sales end of the business with W. Malcolm McKay, Limited, lumber exporters, St. John, N.B., and are just closing a satisfactory season.

Lumber Stocks Will Cost More

Writing to the "Canada Lumberman" a leading lumber firm in the Muskoka district says:—We have two camps in but the number of pieces on skids is away short compared with the same date last year when we had only one camp. Men have been very hard to get. However we expect to get fairly well filled up between now and December 1st. Wages are about the same as last year, \$70.00 per month being the rule, while camp supplies in most lines are higher. As far as we can learn the stock being taken out in our vicinity will not be any greater than that of last year but will cost more per thousand feet. Our mill started cutting about the middle of last April and closed down on September 9th, cutting out a stock of about 4,000,000 feet.

Interested in European Operations

Brig.-General W. B. R. Hepburn,
C.M.G., M.P., Picton, Ont.

Brig.-General W. B. R. Hepburn, C.M.G., M.P., Picton, Ont., who recently arrived in Canada after a three and a half years' active service with the Canadian Forestry Corps, has been at Ottawa during the past few days attending to his legislative duties. He was warmly welcomed back to the capital after an absence of several years. Brigadier-General Hepburn was re-elected representative for Prince Edward County while he was overseas. Major-General Alex. McDougall, who was in charge of the operations of the Canadian Forestry Corps in Great Britain and Brig.-General Hepburn have started business in London, England, under the title of Timber Operations & Contractors Ltd. Their headquarters are at 11-12 Pall Mall, London. They expect

to carry on business generally throughout Europe. Gen. Hepburn will return to England at an early date in connection with his interests but does not expect to reside there permanently. His native town is Picton, Ont., where he is well known and for many years was connected with steamship companies, beginning his career as a purser and becoming President and General Manager of the Ontario & Quebec Navigation Co. and also President of Hepburn Bros. Ltd. He has sat in the House of Commons, representing Prince Edward County since 1911 and politically is a Conservative Unionist.

Price Bros. Erecting New Sawmills

Price Bros. & Co., of Quebec, are erecting several new sawmills, which will add greatly to their production of lumber. They have commenced to knock down the old mill at Matane and will build a new one which it is hoped to have completed by May 1st. The equipment will consist of one double-cutting band saw, one single-cutting band saw, two horizontal band re-saws, two Champion Waterous edgers, lath-mill, etc.; in fact the whole equipment for this thoroughly modern plant is being supplied by the Waterous Engine Works Co., Limited, of Brantford. Price Bros. & Co. are also erecting a duplicate sawmill at Rimouski and at Metis, as well as a smaller mill at St. Juste, besides making drastic changes in their St. Marguerite mill.

In regard to logging operations, Price Bros. do not expect to have more than five camps of their own, as most of their logs are supplied by contractors. The company expect to cut about 200,000,000 ft. this winter if they have a favorable season for woods operations. They do not find the labor situation at all satisfactory as help is hard to get and wages very high and men are independent. The company are installing a new paper machine at Kenogami, which will be in operation some time during the winter. It is the same width as their present machines and will add about fifty tons a day to their output of newsprint.

The Passing of Veteran Shipbuilder

John B. Young died recently at Lunenburg, N. S. He was with the old firm of J. D. Eisenhauer & Co. for many years, but in 1894 started out for himself and built a number of vessels in the shipyard on his own premises, for his own banking and freighting trade. For several years Mr. Young gave up building schooners, but, in response to the great call for tonnage, he installed up-to-date machinery last year and produced a number of fine ships. The salt bulk and frozen herring trade always interested Mr. Young and his schooners have gone to Newfoundland in the business for many years. He also operated a large store and was a successful business man.

Kraft Pulp Producers Handicapped

The demand for high-grade sulphite is exceptionally active at the present time and the prospects are very bright. In regard to sulphate or kraft pulp, the market is somewhat quieter owing to the fact that there is more or less Scandinavian kraft coming into the United States market recently and is being sold at cut prices; in fact the Scandinavian pulp is being sold at a figure under the cost of production. It is understood that the mills, who are holding some of this kraft pulp in Scandinavia, are being forced by their banks to realize, and as they have special freight rates coming to the American side, they can bring their pulp over for very low car-

rying charges. It has been stated that the freight on pulp from the Scandinavian mills to the United States is only about 25 per cent. of what it costs Canadian manufacturers to ship their kraft pulp from Canada to the British market. The Canadian manufacturers feel this is rather a bad handicap, and it is seriously interfering with the call for kraft pulp from the Canadian mills to the United States.

School on Wheels Teaching Forestry

During November a carload of information on forests and their products will visit many centres in the Prairie Provinces. For the past few months the car has visited the forested sections of Eastern Canada and attracted much interest and attention. The exhibits in the car were brought together and arranged by Mr. Robson Black, of the Canadian Forestry Association. The car is the property of the Canadian Government Railways and will be moved from point to point over the lines of the several railway companies operating in the western provinces, and will be under the supervision of an official of the Dominion Forestry Branch.

The exhibits have been drawn from many different countries, including Canada, the United States, Great Britain, Germany, France, Scandinavia, Egypt and Japan. Lectures will be given by the men in charge of the car in the car itself, and also in halls in the towns visited, where every phase of the timber industry, from the planting of seedlings to the manufacture of all manner of wood products, will be explained and as far as possible demonstrated. The car contains a miniature nursery of spruce and Scotch pine seedlings.

Big Paper Plant for Port Arthur

The Great Lakes Paper Company will commence immediately the erection of a huge plant costing between \$4,000,000 and \$5,000,000, just east of Port Arthur city limits. The plant will consist of a groundwood mill with an annual output of 30,000 tons, a sulphite mill, annual capacity 7,500 tons, and a newsprint paper mill of 33,000 to 35,000 tons annual output. Power from the Hydro-electric plant at Nipigon will be used, from 12,000 to 16,000 h. p. being contracted for delivery at the plant at a cost of \$17.50 per h.p., by Dec. 31, 1920.

Engineers, headed by Hardy Ferguson, of New York, are to be on the ground within a few days. Foundations will be commenced at once if weather permits. The plant is to be in full operation by June, 1921.

The personnel of the company is: Lewis L. Alsted, President Combined Locks Paper Co., Wis.; George Seaman, President Seaman Paper Company, Chicago, and James Whalen, President, Port Arthur Shipbuilding Company.

The firm will employ thousands of men in construction and operation. A site of 100 acres has been given free by J. J. Carrick out of his 600-acre holdings immediately east of Port Arthur.

Demountable Ships for Australia

Announcement was made in New York that the Furbear Lumber Company, a New York concern, controlled by British capital, this winter will ship 50,000,000 feet of Douglas fir from Seattle to points in the British Empire in the form of demountable ships.

About 500,000 feet of timber will be used in the hulls of the ships. When they reach their destinations these hulls will be dismantled and delivered as lumber. The hulls and cargo of each ship will represent about 5,000,000 feet, it was said. Admiral Robert R. Peary's famous old exploring ship, the Roosevelt, now owned in New York, will tow the first of the demountable ships to Australia.

The Market for Woodenware in Cuba

In response to inquiries the Acting Trade Commissioner in Havana, Cuba, writes respecting the market for small woodenware in Cuba:—

Wholesale druggists in Havana state that wooden containers for pharmaceutical products are now being used on account of the scarcity of tinned iron. They state that most of these goods are brought from the United States, but think that Canada could compete in this market. Different sizes of wooden pill-boxes are used, but not for pills but for different kinds of ointments. Pills for the most part are put up in cardboard boxes, as these are much cheaper. They also make a quantity of wooden bottles for putting up homeopathic remedies and for sending fragile articles by mail.

Large quantities of handles for carrying parcels are also used. They are made with a round piece of wood for the hand, wire put through and doubled down with a hook at each end to fasten on the parcel. Many dealers have their firm name and some kind of small advertisement stamped on these wooden handles, which they say they would require to have done where they are manufactured.

There is a large market here for broom handles, also handles for different kinds of tools, such as pick-axes, axes, hammers, etc. There is a limited quantity of wooden faucets for wine and beer barrels used.

Canadian Firm Rushed on Lumbermen's Clothing

Griffith B. Clarke, president of A. R. Clarke & Co., Limited, the widely known manufacturers of lumbermen's clothing of all kinds, has outside of the large and important business which he directs, always been interested in recreation and organized baseball and hockey teams among the big staff of employees of the company. Mr. Clarke has one particular hobby and that is motoring both on water and land. He possesses two of the fastest speed boats on Lake Ontario, Leopard I. and Leopard III. The former won the Prince of Wales Gold Medal, and the latter the Gold Challenge Cup, the Great Lakes International \$5,000 trophy, on September 9th at the Canadian National Exhibition. Leopard III, which is a remarkably speedy craft covered a course of thirty miles in admirable shape, averaging 46 miles an hour. Leopard I. is another lightning craft, and, with Mr. Clarke at the wheel, the Prince of Wales Gold Medal was captured on Labor Day. The journey of twenty miles was made in less than forty-two minutes. The accompanying illustration shows Leopard III, setting a pace of mile a minute with Mr. Clarke at the helm. The "Leopards" have been for some years a leading feature in the Canadian National Exhibition motor boat races, which invariably attract much interest and create keen enthusiasm. That "Griff" Clark has been able to carry off the premiums is a matter of gratification to his many friends.

A. R. Clarke & Co., Limited, report that there has been a greatly increased demand this fall for all kinds of lumbermen's clothing and particularly for their well known line of mackinaw coats. The call for work shirts, sheep lined coats, moccasins, gloves and other A. R. C. brand garments has been the greatest in the history of the firm which indicates big activity in woods operations all over the Dominion. The company state that they have never been as busy in the matter of lumbermen's clothing as at present and in many lines there has been an increase of fifty per cent.

The present business was founded in Peterboro in 1852 by John Clarke, father of the late A. R. Clarke, moving in 1882 to Toronto, where they located on their present site, the firm being styled A. R. Clarke & Co. In 1898 the firm was reorganized and became A. R. Clarke & Company Limited. At that time they employed about fifty or sixty men and were capitalized at \$25,000.

In 1902 they started to manufacture patent leather and were, as far as we can learn, the first firm in Canada to do so. Later other lines were added. The glove department alone has an output of

Griffith B. Clarke's Leopard III, setting the pace in motor boat races at Toronto

approximately 1000 dozen pairs a week. Some three hundred are on the payroll and the total production for this year will be well over \$3,000,000.

Mr. Griffith B. Clarke, head of the company, came into the firm in 1906, after completing his education at St. Andrew's College, Toronto. Unlike many other young fellows, who doubtless would have ridiculed the idea, Mr. Clarke donned overalls and went to work in the beam house—the most disagreeable task in the whole process of tanning, but one which the successful tanner must be intimately acquainted with, since it underlies the ultimate quality of the leather. As vice-president of the company later on Mr. Clarke had much to do with the buying of materials and the sale of patent leather and has made several trips to Europe in this connection.

Readers will recall the unfortunate death of Mr. A. R. Clarke, president of the company, who was one of the victims of German "kultur" on the ill-fated Lusitania.

Some years previous to this Messrs. C. E. and F. G. Clarke who had been in the business with the late Mr. A. R. Clarke when the tannery was moved from Peterboro to Toronto, started another tannery in Toronto for the purpose of specializing on sheepskins. These two younger brothers passed away within a couple of months of each other—Mr. Charles E. Clarke on Christmas Day, 1917, and Mr. F. G. Clarke on February 18th, 1918.

Following the death of his father, Mr. Griffith B. Clarke became president of A. R. Clarke & Co. Ltd., and has combined new blood and enterprise with the rigid principles laid down by the founder of the business.

Veteran Northern Lumberman Passes Away

One of the best-known lumbermen in Northern Ontario passed away recently in the person of Wm. Turnbull, who was one of the pioneer citizens of Huntsville, Ont. He had been ailing for some months. Mr. Turnbull had been a resident of Huntsville for the past thirty-three years, being at first a partner in the lumbering firm of Heath, Tait & Turnbull. Some years later, upon the retirement of Mr. Heath the Huntsville Lumber Co. was organized with Andrew Tait, now of Toronto, as president, and Mr. Turnbull as secretary. The latter continued his active management of this company until two years ago, when he retired.

Mr. Turnbull who was born in Glasgow, Scotland, enjoyed the

The late William Turnbull,
Huntsville, Ont.

confidence of his associates in the lumber industry and his passing marks the severance of another link connecting the present with the past. He is survived by his wife (formerly Miss Elizabeth M. Lightbody of Glasgow) and three children. They are Harry Turnbull of Sarnia, Ont., Mrs. McCloskey of Powasson, Ont., and Mrs. Cameron of Chicago. John Turnbull, President of the Nasmith Company, Toronto, is a nephew. Previous to taking up his abode in Huntsville in 1886 the late Mr. Turnbull was a resident of Toronto for a short time and later lived in Orillia.

The remains were interred in St. Andrew's cemetery, Huntsville, and the last sad rites were attended by a large concourse of people evidencing the esteem and respect in which he was held.

Lumber Industry Active Around Nelson

That the lumber industry in and around Nelson is booming and that the interior is experiencing prosperity such as not been known since the war is the encouraging information given F. F. Payne of Nelson who was recently in Vancouver on business. He says that practically every stick of timber that can be sawed is being placed on the market, all the yards being cleaned up. New mills are being built at Boulder Creek just north of Nelson by Mr. O'Neil and associates. Seventy-five men are employed and 200 in the mill and limits. Baskin and Stedman have erected a new mill just west of Nelson and are cutting poles, posts and timber.

Machinery has been received by A. S. Horswill for a new mill at Nelson and in a few weeks this plant will be in operation. Krey-scher and Kenny have a portable mill on Groohman Creek and are cutting timber for the flume and bringing down logs to cut at the plant at Nelson. This plant which has been engaged for the most part in box making, is being extended.

Should Encourage Wooden Shipbuilding

Shipbuilding in Nova Scotia is in a very unsettled state at the present time, although the best authorities maintain that if all the shipbuilding plants in the world kept in full swing for the next ten years they could not supply the demands for ships, says the Yarmouth "Times." Still the industry for this province does not offer to the builder a sufficient inducement to justify him in continuing his operations and in as much as the shipbuilders have gone to such an expense as to equip their various plants, and many thousands of workmen are being thrown out of employment just at this season of the year, when all the returned soldiers are looking for work, it is at this time the Nova Scotia government should make a special effort

to offer immediate assistance to encourage this very important industry.

The government of Nova Scotia some two years ago passed an act, authorizing this government to borrow on the credit of the province, two millions of dollars to stimulate the shipbuilding movement.

A commission was appointed with a person of reputed importance as chairman, to investigate the needs of this industry and recommend a course of action to the government. Aside from the fact of the chairman taking a trip to England and Europe, at the expense of the government, absolutely nothing was done.

The report of the commission was to the effect that the shipbuilding industry in Nova Scotia was sufficiently flourishing and did not need any government assistance.

Neighboring Dominions, much smaller in size and population foster the shipbuilding industry to the extent of guaranteeing a dividend of 5 per cent. on the stock of a company that would incorporate to build wooden vessels. In addition to this, they offered a bonus of as high as twenty dollars a ton for every vessel that is built.

With our knowledge of the industry, the report, to our minds was not based on good judgment and foresight. Its authors did not realize that, though the industry appeared to be booming at the time, double the quantity of ships would have been built and sold if it were not for the uncertainty as to the duration of the war.

Many more yards would have been opened, and many more ships built if the people had the assurance that the shipbuilding business would not terminate with the end of the war, or before they had time to get under full operation.

There is no desire on our part to criticize the incapacity of the commission, but our remarks on the question are made with a view to getting the government to again take up this very important subject and have the commission take such steps as are necessary to offer assistance to re-establish this fast fading industry and offer inducements which will justify builders to resume their operations and thus keep up this very important industry which has made such headway and created such a boom in shipbuilding in Nova Scotia.

If the Dominion of Canada considers it advisable to spend sixty millions of dollars to create employment for returned soldiers, etc., our government should at least spend a little effort and money in fostering this very important industry.

Develop Pulp Business with Orient

Sir George Bury, who is head of the Whalen Pulp and Paper Co. of Vancouver, has sailed for the Orient and will be absent for several months in connection with the development of the pulp trade with the East. Sir George is of the opinion that there is a great future for British Columbia pulp in China and Japan and says that several large deals are pending and that the Coast needs the business. The output of the Whalen Co. has lately been increased from 56,000 to 75,000 tons annually. The President of the Company stated before his departure that trade and commerce is best provided by the managers first visiting new markets personally and establishing a connection so that future dealings are of a more friendly character. For this reason Sir George will spend several months in the East.

Would Defer Wharfage Rates Increase

The committee of the Montreal Board of Trade Transportation Bureau on November 6 discussed the increase in wharfage rates which the Montreal Harbor Commissioners propose to make effective on January 1st next. It was stated that these increases involve a considerable amount, and will seriously add to the cost of doing business through the port of Montreal, which would to that extent hamper the business of the port as compared with that of competitive ports. It was decided to ask the council of the Board of Trade to interview the Harbor Commissioners for the purpose of ascertaining if it is not possible, from the standpoint of the Harbor Commissioners, to avoid the necessity of increasing the wharfage rates in the manner proposed. Should this not be found feasible it was decided to urge a further postponement of the proposed increases in order to afford the council of the Board of Trade time to bring the whole matter to the attention of the Dominion Government.

The British Columbia Government has inherited a ready-made town—Thurston Harbor, Queen Charlotte Island. It is a munitions town, erected at a time when production of spruce for airplanes was a matter of life and death for the Empire.

With the ending of the spruce industry came the end of business life in the town, so Major A. C. Taylor, Director of the Department of Air Supplies for the Imperial Munitions Board, offered the entire establishment to the Provincial Forestry Department. The offer has been accepted.

Market For Wooden Turnings in Australia

In response to inquiries, Mr. C. Harlett, Acting Canadian Trade Commissioner in Melbourne, writes:

Parts for piano-players, rolls, for typewriters and skewers for cotton mills are not marketable here. Piano-players are not made here, and spare parts are supplied by the makers of the players. Typewriter rolls are also supplied by the makers of the various machines on the market, as the outside rubber vulcanizing process cannot be done here. There are no cotton mills in Australia and therefore no call for skewers.

Pill boxes are made locally but of poor quality and finish compared with the imported articles, the trade in which is largely confined to the products of one United States house. If Canadian products can compete in quality and factory price with the product of this firm, there is a prospect of good business, but this can only be definitely determined by the production of samples.

Draw pulls, rollingpins, rack pins, and, to some extent, floats for fish nets, hubs for carts and short handles for tools (not hickory), are made locally. Hickory handles are the most popular and are mostly imported from the United States.

Turnings for baby carriages, croquet mallets and stakes, hickory handles, wood faucets, pill boxes, and hubs for carts are the articles for which there is a market in Australia, provided Canadian quality and price (f.o.b. ocean port) are competitive with those of United States manufacturers.

If Canadian manufacturers will supply particulars of quality and prices of the lines above indicated, this office would be in a position to approach dealers and definitely ascertain their selling possibilities.

New Power Plant of Bathurst Company

The Bathurst Lumber Co. of Bathurst, N. B., report that good progress has been made in connection with their logging operations, as, owing to the exceptionally fine Fall, work has been carried on in the woods expeditiously. It looks as if the company are going to have a very much larger cut of logs than a year ago.

In regard to labor, they say that men are not too plentiful. Wages run from \$10.00 to \$15.00 a month higher than last year and the costs of all supplies are practically the same, so that as far as can be judged at present, the costs of lumber for 1920 will be considerably higher than it was for 1919. One of the large saw-mills of the Bathurst Lumber Co. at Bathurst, has closed down while the other is still being operated and will be kept going until the freeze-up takes place, which is usually about December 1st.

The company are now proceeding to develop their water-power on the Nepisiquit River at the Grand Falls, twenty miles from Bathurst. They are putting in two units of 4500 horse power each, and this power will be transferred to Bathurst for running the pulp-mills, saw-mills and other industries of the company, who hope to have it going in a year from now.

With respect to the building of a paper mill in connection with their plant, Angus McLean, General Manager of the Bathurst Company, states that nothing has finally been determined as yet and that no decision will be made until some time next year.

Wooden House Campaign in Britain

The latest cable information from London as to wooden houses bears out the news given in our issue of November 1st regarding the difficulty of the Canadian type being accepted in England. Not only is there a certain amount of prejudice to be overcome, but it is asserted that the cost, including the freight, will bring it up to something near that of brick houses.

A recent message states that a "wooden frame house from British Columbia, with accommodation, fittings and conveniences for domestic use approximately to those now required in Government assisted schemes, is not likely to be completed for much less than \$3,500 and the cost may not improbably be even more. The Canadian wooden house commonly referred to differs in many respects from the house which a tenant in this country expects to obtain." continues the official announcement from the Ministry of Health. "These wooden houses, for instance, have as a rule a basement containing a stove for central heating of the whole house. This method of heating differs entirely from that to which the English housekeeper is accustomed, and if the English prejudice in favor of the open fire is to be respected, considerable modifications in internal design and construction are inevitable."

Sir Charles T. Ruthen, an eminent British architect, has built three wooden houses at Newton, near Swansea, at a cost of \$725 less than a brick house of the same size, and Sir Charles claims that it will be more damp proof, and will last at least 200 years.

The walls of these experimental houses are covered both inside

and out with cement stucco. A bitumen sheet makes them vermin and damp proof. Strength is obtained by a scientific system of lacing with wooden laths. The roof is tiled. As far as appearance is concerned, there is no reason, in Sir Charles' opinion, why a house built on such a system should not be quite as attractive as a brick house.

There can be no doubt, judging from reports in English papers, that wooden houses would meet with considerable favour, providing the cost is reasonable. Those British firms manufacturing wooden houses have been overwhelmed with inquiries, and one London firm has sold large quantities at prices ranging from \$410 for a two room house to \$2,075 for a six-roomed bungalow. These houses have felt-covered roofs and asbestos-lined walls. Mr. Wade, the Agent General of B. C. in London, has received thousands of inquiries.

Sir Kingsley Wood, M. P., Parliamentary Secretary to the Ministry of Health, in an interview, stated that the Ministry fully recognized the necessity of making what housing provision is possible for the winter months. "I have seen the proposals for wooden houses," he said. "Many, I understand, have been successfully built in Canada and the U. S. A., but judging from the facts before us, they do not meet with enthusiasm from the workers of this country. The Ministry have formed the opinion that the workers would not accept such houses in lieu of brick. It is considered, too, that they would not be so inhabitable or durable as to make them a possible alternative to the present Government scheme. We recognize, however, the plight in which so many thousands of people find themselves to-day, and the public may be sure that if some more speedy and cheaper method of building can be found we shall not hesitate to make use of it."

Mr. W. F. Regan has offered to import 60,000 houses from the United States in 12 months, and he suggests that the Government should order the houses.

Canada's Opportunity in Wood Supplies

Mr. Harrison Watson, Government Trade Commissioner in London, who is on a visit to Canada, in an interview declared that in the matter of wood supplies of all kinds there is a splendid opportunity in the United Kingdom for export.

To give an instance of the quantities in which these people order Mr. Watson said he was talking to one U. K. buyer who had returned from a business visit to Canada who informed him that he had placed one order for \$200,000 worth of wooden pegs, used for the manufacture of furniture. An insignificant article like a wooden peg therefore mean the necessity of a great production and output if the Old Country market is to be met and satisfied.

The mills in the United States on the other hand are in most cases equipped to handle large quantities at a small margin of profit and in many instances the English buyer comes to Canada, finds he cannot get his demands satisfied here, buys all the Canadian goods that are offered, but is finally forced to place the bulk of his orders in the United States.

Canadian export firms also suffer by the lack of direct representation in the United Kingdom. The buyer over there on enquiry for a certain article finds that Canada produces it but has no official representative or agents for that particular article in the United Kingdom. He finds that the United States produces the same article and producers have their direct agents in London and Glasgow, or some other large centre, and the importer is not obliged to do his business by the correspondence route.

Seventy-five million boxes are used in the United Kingdom every year and about nine tenths of these are imported. In this line Mr. Watson said there were vast possibilities in the export of box shooks from Canada.

McGibbon Lumber Co. Will Rebuild Mill

The McGibbon Lumber Co. of Penetanguishene, Ont., whose mill was recently destroyed by fire, report that their loss is \$30,000.00 and fairly well covered by insurance. It is understood that the company will rebuild as soon as insurance and other matters are adjusted, and that a new and larger plant will likely be ready for operation next season.

In speaking of the fire a local paper says: The blaze broke out at the noon hour when all the men were at home for dinner and in a few hours the mill, one of the old landmarks in the town, was burnt to the ground. Fanned by a high wind it was only a few minutes till the whole structure was a mass of flames. When the firemen arrived on the scene they directed their attention towards saving the adjoining buildings and keeping the fire from spreading. Thanks to the rain falling in the forenoon, they were successful. Had the shingles on some of the old frame buildings in that vicinity been dry there is no telling where the fire would have been stopped.

When President Beatty was an Urchin

There was taken at Thorold, Ont., some thirty-four years ago on the occasion of a Trades Celebration, an interesting picture, showing some timber which formed a feature of the procession. This timber was exhibited by McCleary & McLean, who conducted a saw-mill and yard at Thorold for many years. In connection with the illustration presented one can never foretell to what height the small boy, ever present when anything unusual is going on, will rise in the esteem of his fellows and the service of his country.

In the photograph are noticed three lads, standing near the front and to the rear of the log. There is one little chap scarcely

A parade in Thorold which Mr. E. W. Beatty saw in 1885

noticeable, his head just appearing over the side of the obstruction. He was of miniature proportions physically in 1885 but to-day he is a nationally-known figure and leader. His name is Edward Wentworth Beatty, K.C., President of the Canadian Pacific Railway.

L. B. E. McCleary, to whom the "Canada Lumberman" is indebted for the picture, showed it to T. L. Church, Mayor of Toronto, not long ago. Toronto's Chief Magistrate is a personal friend of the C. P. R. magnate, and when told who the boy was, said "Oh yes, Eddie, as usual, trying to get out of sight! He always did hide his light under a bushel." The lad in the centre of the group of the three boys is A. A. Ewart, Secretary and General Manager of the Prince Rupert Spruce Mills Co., Ltd., of Prince Rupert, B. C., and the boy to the reader's left is Dr. Harry Beatty, now of Toronto, Chief Surgeon of the Canadian Pacific Railway and brother of the C. P. R. President.

West Keenly Alive to Forest Problems

Taking advantage of the growing interest in public affairs throughout the Prairie Provinces, Mr. Robson Black, Ottawa, Secretary of the Canadian Forestry Association, accompanied by a motion picture operator, addressed thirty public meetings between October 14th and November 1st. Mr. Black found the public interest in questions related to provincial forest management strikingly intensified as compared with four or five years ago. Western Canadian Clubs, Boards of Trade, Bankers and Mortgage Loans Associations and other representative bodies held luncheons and dinners in nearly all large cities in order to provide an opportunity to hear forest conservation addresses. At some of the evening meetings in places like Calgary, Prince Albert and Winnipeg, the attendance of men ran as high as 600.

The chief point in the addresses was an outline of the extent of the prairie province forests and their present wretched condition owing mostly to unrestricted forest fires. Instead of an increasing variety of wood-using industries, the larger mills were giving up operations and enormous areas—as, for example, 40,000,000 non-agricultural acres in Saskatchewan—were being turned into permanent wildernesses. The effect of burned forests upon irrigation was also discussed in detail and proved one of the hardest hitting points in the whole conservation argument. The industrial potentialities of spruce-growing lands, the need of provincial and Dominion co-operation in debarring the annual fire plague, the value of tree-planting to crop production were other points treated by Mr. Black. The Forestry Association is endeavoring to establish a resident Western propagandist and to engage a Children's Lecturer. The latter would give his entire time to school addresses in all parts of Canada and would make generous use of motion pictures. In this way, scores of thousands of young men and women annually would become personally acquainted with the interesting truths of forest protection and the constructive handling of the natural resources. An appeal will be made for better financial support of the Forestry Association which has a slight government revenue and a national membership of ten thousand.

Real Possibilities of Lumber Ship

Commenting on the proposed Livvental lumber schooner, and a suggestion that salt water will injure lumber, Captain Midford, of Ottawa, writes:—

When the export of lumber was so desperately required in England for war purposes, the writer brought to the attention of lumber exporters here and in London the real possibilities of lumber-ship. He was met by some of the objections mentioned in the item cited—the Pacific Coast and Nova Scotia experiments, etc. In 1915 the Timber Trade Journal, London, cited the answers to these objections and said "until the strains to which any ship and floating structure is subjected and provided for upon the same scientific lines necessary and imperative to meet and overcome these strains, no timber raft would ever become a success." From Joggings raft to the latest by Vickers, of Pacific Coast failure, no one has provided for this condition, hence these failures.

It was clearly shown to exporters here and in London that a lumber-ship could be designed from five to fifty million feet B. M. capacity, and the freight would be a very considerable below 8.80.

For goodness sake don't let any shipbuilder see or read this next objection made by Montreal lumber exporters, viz.: "Salt water would have a detrimental action upon the lumber, it being pointed out that wooden vessels invariably had their bottoms copper sheathed in order to protect the timber from the salt water." Wooden ships were never coppered for the purpose cited, but to prevent the teredo worm boring into the ship's bottom. When we were building Brooklyn Bridge, the Navy Yard gave us timber sunk in salt water in 1774. These timbers were successfully used to build 40-ton derricks. It may be interesting to Montreal lumber exporters to know that while the teredo worm will bore and travel all through a timber any dimensions, it will never bore through two pieces of lumber no matter how thin.

Great Cedar Shingle Congress in Seattle

The red letter days on the shingle manufacturers' calendar this winter will be December 10 and 11 on which dates will be held the third annual session of the Red Cedar Shingle congress.

On account of its location in the centre of the shingle producing industry, Seattle again will be the meeting place. Sessions will be held in the Washington hotel.

An interesting feature of this year's congress will be a "service exhibit" of what the shingle manufacturers are doing in the way of intensive merchandising.

A special invitation is being extended to lumber dealers everywhere and to eastern shingle distributors, thus providing an opportunity for manufacturers, wholesalers and retailers to get together on common ground and discuss ways and means of bettering the shingle industry. The detailed program, in charge of J. S. Williams, secretary of the Shingle Branch of the West Coast Lumbermen's Association, probably will be completed in the next few days.

How Canadian Timber Ascends in Value

"I am interested in a large estate of some thousands of acres in Canada," said G. St. Lawrence Mowbray, chairman of the Anglo-Belgian corporation at the annual meeting in London, Eng. "Three years ago it was proposed to clear a considerable area for agriculture. There was a considerable amount of timber but we were advised it was unsaleable and would cost between £5 and £15 per acre to have it felled and burned. As the war was on we did not proceed with the project, but we have now received an offer of £10,000 from a large lumber firm in Canada for the right to go and cut such timber as they saw fit." Mr. Mowbray added that the erection of wooden dwellings and factories now being advocated in England would add greatly to the demand for Canadian timber.

Pulp and Sawmills for Labrador

Major Daniel Owen recently spent a few days at his home in Annapolis Royal, Nova Scotia. He is President and Treasurer of the North American Corporation, Limited, with head offices in Boston, and says that branches will shortly be opened throughout Canada and the United States. The first securities to be offered the public will be the South Labrador Pulp & Lumber Co. with a capital stock of \$10,000,000, of which Major Owen is also President. This company will exploit the timber limits recently explored in British Columbia by the aerial expedition, which sailed from Annapolis Royal. A large staff of hydraulic engineers, pulpmen and lumbermen has been retained. The lumber mills will be in active operation next year and it is hoped by the end of the season a large pulp plant will also be located on the property. Several thousand tons of machinery and supplies will go out at the opening of navigation.

Scarcity of Help in Bush Operations

Reports received by the Government Employment Bureau at Ottawa from all parts of Canada indicate that there is great difficulty in getting men to go to the lumber camps this season, or to remain when they get there. One large operator is asking for a thousand additional men; others are in a like predicament.

The situation is made worse in the eyes of lumbermen in that of the shantymen who have returned from overseas ten thousand have drifted into other occupations. After their martial experiences abroad and fleeting glimpses of life in many old world centres these lads seem to have gained a thirst for city life, which they are now trying to quench. Even the fact that wages paid in the camps have doubled since the old days does not draw them from the lure of the big city.

It is true that a small proportion of men who lived originally in the city are going to outside occupations, and some of them to the bush, attracted by the healthy open-air life, the rude comfort, and the bountiful food which are the rule there. But these do not begin to make up for the loss of the shantymen.

But the lumbermen are willing to take a number of greenhorns to work in with what experienced men they get, and to teach those who are quick and adaptable whatever there is to learn.

How Logging Costs Keep Going Skywards

It is interesting to note what it costs to board men in the lumber camps to-day. In most operating centres wages are about the same this year as last although there is a tendency on the part of men to demand a higher figure in some districts. Operators have not yet ascertained this season what it is costing them to board the men for any definite length of time, but report on the whole that supplies are about the same in figure as last year, although hay and oats are much higher. Here is how costs have ascended during the past four years in the matter of rationing men, feeding teams and wages in the bush.

One of the largest operators in Ontario, who employed about four hundred men in his camps during 1918-19, has just been furnished by the Auditing Dept. with a complete statement of what the outlay has been during the past four years. Each season covers about seven months and the costs are arrived at on the basis of twenty-six working days to the month.

Subjoined is a comparative statement of expenditures, which shows that, while men were boarded for about 50c a day in 1914-15, the disbursement last Winter was about \$1.11. Feeding teams, which in 1914-15 cost less than \$2.00 a day, now runs about \$3.25, and wages have aviated from \$27.00 per month to \$65.00. Thus it will be seen why the quotations for lumber are constantly augmented and, judging from present indications, forest products will go considerably higher by the time that next season's cut comes on the market.

Here is a table of interest:

	Per Month, 26 Working Days		
	Boarding Men	Feeding Teams	Wages
1914/15	\$13.73	\$49.40	\$26.98
1915/16	15.17	51.61	24.54
1917/18	26.06	69.83	54.09
1918/19	29.04	84.59	64.52

Experimental Cutting By Eastern Lumber Co.

The work on the permanent experimental plot which has been laid out on the Nepisiguit River through the co-operation of the Bathurst Lumber Company, the Conservation Commission and the Crown Land Department of New Brunswick, is progressing very favorably.

An area of 490 acres of forest land has been set aside for 25 years by mutual agreement and the Bathurst Lumber Company is cutting this area according to many various regulations and systems laid down by Dr. C. D. Howe of the Conservation Commission with a view to finding out what change may be made in the rate

of growth and nature of the reproduction resulting from each of the various methods of cutting. On some of the area all the slash and brush is being burned and all material in the tops suitable for pulpwood is being taken out.

Mr. Angus McLean, General Manager of the Bathurst Lumber Company, is taking a keen interest in this experimental cutting and thinning and deserves much credit for making possible this valuable experiment even with increased cost for logging, it being one of the first and most extensive experimental thinnings being undertaken in Canada.

Mr. John Lordon, Superintendent for the Bathurst Lumber Company, has been in charge of the logging for the Bathurst Lumber Company, and R. D. Jago, of the Forest Service, laid the plot out and has been in charge of the cutting for the Conservation Commission. Mr. Hermann Good, a returned soldier who won the Victoria Cross, has filled the position of camp foreman over the 50 men employed in a very satisfactory manner.

Dr. C. D. Howe, of the Conservation Commission, picked out the side for the plot and expects to visit the area for the third time in December, after most of the cutting has been completed.

W. M. Robertson, B.Sc.F., of the Conservation Commission, is in charge of the plot at the present, having relieved Mr. R. D. Jago recently, who had to return to Fredericton.

Wages Are Higher and Men Scarce

W. Gerard Power, Manager of the River Ouelle Pulp & Lumber Co., St. Pacome, Que., says in regard to logging in the Eastern part of the Province that wages are very much higher than last year and men are none too plentiful. It is difficult to get any idea at the present time just what the log crop will be during the present Autumn and coming Winter. Much will depend on what kind of a winter Quebec has in the matter of snow, cold weather, etc. The River Ouelle Pulp & Lumber Co. had a very satisfactory season when everything is taken into consideration but has been hampered for several months now by car shortage. As large a quantity of lumber has not been moved as there would have been, had shipping arrangements been normal.

Shortage of Loggers is Experienced

There is practically not a lumber company in the mountains that could not use more men at bush work, states I. R. Poole, secretary of the Mountain Lumber Manufacturers' Association, and unless the influx, now overdue, of harvesters from the prairie helps out the situation the log cut this coming winter and the lumber cut the following summer will be seriously curtailed. This year's lumber cut is shorter than last year's because of the labor shortage, which so far has not shown any improvement.

Lumbermen Responsible for Employees

A recent despatch from Fredericton, N. B., says:—Chief Game Warden L. A. Gagnon, returned from Albert County lately where he had three cases of violations of the game act before Justice of the Peace A. A. Reid, of Harvey, all of which resulted in conviction.

One of the charges was against a lumberman under the new amendment to the game act which holds a lumberman liable for violations of the act by men in his camps. Some of the lumberman's employes were found in the woods with rifles but without having a license. The lumberman was fined \$50 and costs. These were the first cases coming under the recent amendment.

Pit Props for Steel Corporation

It may not be generally known that the Dominion Steel Corporation own 50,000 acres of timber limits in Cumberland, N. S. From these the company secure all their pit props. Sufficient timber is contained in these limits to take care of the company's needs for an indefinite period, besides which they have a certain quantity for sale for commercial purposes.

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 20 cents per agate line (14 agate lines make one inch). \$2.80 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 20th of each month to insure insertion in the subsequent issue.

PULPWOOD FOR SALE

Ten thousand cords of pulpwood for sale; next summer delivery. Shipping point, Blue River, Canadian National Railway. Apply to

QUEBEC LUMBER CO.,

Phone 329 98 St. Peter Street,
22-25 Quebec, Que.

Wanted-Machinery

Wanted

Barienger Braking Device, six blocks, with or without cable. Apply Bishop Lumber Co., Ltd., Nesterville, Ont. 22-23

For Sale-Machinery

For Sale Cheap

One full front 80 H.P. Tubular Steam Boiler, Goldie & McCulloch make. One 65 H.P. Steam Engine, Wheelock's newest type, Goldie & McCulloch make. All as good as new, only used a short time. Move quick for bargain. Apply to Gordon Lumber Co., Stratford, Ont. 21-22

FOR SALE

One Brown type engine, first class condition, 10" x 24", all fittings, ready to set up, 16" x 7" belt wheel.

One Belt, 70' 6" x 44", 3 ply leather endless, scarcely soiled. Two Belts, 60' 6" x 20" double leather, scarcely soiled. Two inserted tooth lumber saws, one 56" practically new, one 52" in good condition. 1 Leonard-Ball centre crank high speed engine, 14" x 14", 12 1/2" x 50" belt wheels. 1 belt, 72' 36", double leather, scarcely soiled. 1 belt, 66' 5", 28" double leather, scarcely soiled. W. H. Cook, Box 356, Orillia, Ont. 22

Band Saw Mill Complete

Waterous 9 ft. Band Mill, Gunshot Feed Carriage, with extra Saws complete.

Filing Equipment

Three Saw Edger, lot of live rolls, Engine, Shafting, Hangers, Pulleys, etc.

All of the above is Waterous equipment in good condition at a bargain.

The Geo. F. Foss Machinery & Supply Co., Limited,

305 St. James Street,
17-t.f. Montreal, Que.

For Sale

- 1—17 x 24 Atlas Engine, with 36 in. x 10 ft. flywheel.
- 3—No. 94 Berlin Matchers, 15 in., fitted with hard steel knives on top and bottom cylinders—one pair shiplap, jointer and flooring heads with bits for each machine.
- 1—No. 182 Berlin Double Surfacers, 30 in. x 6 in.
- 1—No. 199 Berlin Buzz Planer.
- 1—No. 290 Berlin Picket Header.

The Otis Staples Lumber Company, Ltd.,
19-t.f. Wycliffe, B.C.

Band Mill For Sale

One Band Mill complete for sale, consisting of two 12" double-cut Band Saws, one Band Resaw, four Engines, five Boilers, two large Smoke Stacks, one complete Electric Light Outfit, steam feed and steam set steel Carriages, Dump Carts, etc. Situated at Midland, Ont. A bargain for quick sale. The Mageau Lumber Co., Ltd., Field, Ont. 22

For Sale

One "S. A. Wood Matcher 24" fitted with 20 different sizes knives for top and bottom cylinders. Four pairs of heads with six sets of bits. Price \$500, on cars. Savoie & Co., Manseau, Que. 21-t.f.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

YOUNG MAN, experienced in all branches of lumber trade, open for position as sales man or manager of manufacturing plant or yard. Box 52, Canada Lumberman, Toronto. 21-22

LUMBER SALESMAN with established connection among first credit rating clients only, wishes to secure a manufacturers line of matched Spruce boards, and Hemlock lumber, on a percentage basis. Can place large orders from A1 firms. Apply Box 54, Canada Lumberman, Toronto. 22

LUMBERMAN OF EXPERIENCE in all branches of the business, will shortly be open for engagement of responsibility, or as salesman. Have several years' experience and first class connection with the best trade in the Maritime Provinces, Quebec, Ontario and Eastern States. This is an opportunity for a firm to secure a highly recommended man able to produce results. Apply Box 56, Canada Lumberman, Toronto. 22

Wanted-Employees

WANTED FIRST CLASS INSPECTOR experienced in both hard and soft woods. J. R. Eaton & Sons, Limited, Orillia, Ont. 22

WANTED HARDWOOD INSPECTOR at Montreal, familiar with National Hardwood Lumber Association grading rules. Permanent position at good salary. Must speak French. Box 53, Canadian Lumberman, Toronto. 21-22

Business Chances

Planing Mill Wanted

Will buy planing mill in Ottawa Valley or Central Ontario. Must have siding and yard room. Give price and full description. Box 50, Canada Lumberman, Toronto. 21-22

For Sale

Bargain—Must be sold quick, two side mill, both double cut bands; one Band Re-Saw, two Edgers, Lath Mill, Filing equipment, Engines, Boilers, Belting and Shafting all complete. Apply Box 43, Canada Lumberman, Toronto. 22

Saw Mill Plant For Sale

Practically new and modern Saw Mill Plant, capacity about 30 Million feet per annum, located in the Interior of British Columbia on a beautiful inland lake and on the main line of the Grand Trunk Pacific Railway. About 500 Million feet of timber on and adjacent to Lake (about 90% Spruce) and another Billion feet available at reasonable prices. Natural conditions ideal for economical logging, manufacturing, piling and shipping. An advantage of about \$4 per thousand feet in freight rates to the Prairie Provinces over Coast shipments. This property offers unlimited possibilities as a lumber, pulp and paper property. Would consider selling a half interest. Terms reasonable.

A. C. FROST COMPANY,
134 South LaSalle Street,
5-t.f. Chicago, Ill.

Auction Sale of Valuable

Quebec Timber Limits

R. H. Klock & Co., through W. A. Cole, Auctioneer, on the Nineteenth day of February, 1920, at the hour of three o'clock p.m., subject to one reserve bid, will offer for sale by Public Auction at the Russell House in the City of Ottawa, in the Province of Ontario, timber berths numbers 176 and 177, Kipawa, are 100 sq. miles more or less. These timber limits contain large quantities of pine, spruce, and other wood goods. For further particulars apply to James B. Klock, 70 St. Matthew St., Montreal; Errol M. McDougall, K.C., Royal Trust Building, Montreal; D. B. Rochester, 145 James Street, Ottawa, and W. A. Cole, Hope Chambers, 63 Sparks Street, Ottawa, Auctioneer. 21-26

To:
Lumbermen—
Trust Companies—
Banks—
Executors of Estates—
Or Private Owners of
Timber and Pulp Lands.

If you are contemplating offering your Limits for sale by Auction, bear in mind that the Capital of the Dominion is the greatest lumber centre in America and the place to hold your sale.

Will be pleased to give you all information as to details, etc.

WM. A. COLE,
Auctioneer.

OFFICES:
63 Sparks Street, Ottawa, Ont.

Established—1895.

SALE OF Military Stores, Etc.

Dry Goods, Hospital Furniture,
Bedding, Hardware, Leather
Goods, Junk, Etc.

SALES WILL BE MADE BY SEALED TENDERS

Persons desiring to tender are requested to register their names and addresses with the

Secretary of the War Purchasing Commission, Booth Bldg., Ottawa stating the class of goods in which they are interested, whether new or second-hand or both.

Tender forms with full details of the goods and places at which samples may be seen, will be mailed when ready to those who have registered as requested above.

Special Terms to Hospitals, Etc.

Dominion, Provincial, and Municipal departments, hospitals, charitable, philanthropic, and similar institutions which are conducted for the benefit of the public and not for profit may purchase goods without tender at prices established by the War Purchasing Commission.

Returned Soldiers and Sailors and Widows and Dependents of Soldiers and Sailors killed in the War may obtain supplies, for their own personal use and not for re-sale, through the nearest branch of the Great War Veterans Association who will combine individual orders and forward to the War Purchasing Commission through the Dominion Command of the Great War Veterans Association. These services are rendered by the Great War Veterans Association to all parties in the classes named, whether members of the Great War Veterans Association or not.

All communications should be addressed to the Secretary, War Purchasing Commission, Booth Building, Ottawa, who will be glad to supply lists and further details to those interested.

Canadian Timber for Europe

Canada's position as a candidate for part of the tremendous overseas trade that is expected to accompany the rebuilding of devastated Europe is carefully expounded in the export edition of the Canada Lumberman and Woodworker. This contains a shadow map of the European markets in which Canada hopes to sell some of her merchantable timber. There are startling figures, but they are quoted by the Canada Lumberman from a census taken by the Dominion Bureau of Statistics. The pulpwood is estimated at about one billion cords. It is stated that the timber wealth of British Columbia alone amounted in 1908 to 300 billion feet. Up to 1917 only about 30 million feet board measure had been cut. Canada's unsurpassed opportunity in world markets created by the necessity for rebuilding Europe's ruined

farms and cities is dealt with in a leading article. The structural material each country requires, how it should be cut, graded and delivered, is tersely told, with the admonition that "Canada should bid for a large share of this business, because she has the forests, the mills and the labor necessary to produce large quantities of timber to suit all markets."—Timber Trades Journal of London, Eng.

General Activity in Lumber Trade

The last edition of the Labor Gazette, Ottawa, says:

Charlottetown reported dullness in the lumber industry. The saw and shingle mills at St. John were busy. Fredericton reported that the lumber mills of the district continued to operate at full capacity and that preparations were being made for the winter bush work. Quebec reported that most of the sawmills in the district were still operating, but that river driving was confined to the floating of grounded logs. The lumber camps had not yet opened up. Sherbrooke reported that the lumber camp was fairly active and that the saw and shingle mills were busy. The sawmills at Ottawa and Hull were in full operation. Peterborough reported that the lumbering industry was very active and that there was some difficulty in getting men for the woods. Owen Sound reported that the sawmills were fairly active, but that the tie and shingle mills were rather quiet. Sault Ste. Marie reported a demand for men.

Fire Fighting or Prevention?

Except London, Paris and Berlin, European cities, have paid little attention to modern fire protective equipment. They have directed their chief energies to fire prevention. Municipal expenditures have been devoted to the control of building construction and maintenance. On the contrary, Canada has developed very elaborate and efficient fire-fighting facilities. As regards appliances, methods and personnel, the fire brigades of large Canadian and American cities are incomparably superior to those of other countries. In this course of action lies one of the essential differences between the respective policies of Canadian municipalities and those of Europe. To prevent rather than to extinguish fires has not impressed public bodies in Canada as being a part of their functions. Consequently, the annual maintenance costs of city fire departments average \$1.43 per capita, fire losses \$2.96 per capita, and insurance rates \$1.18 per capita in Canada as compared with 21 cents, 71 cents and 26 cents, respectively, in Europe.

Review of Current Trade Conditions

Ontario and the East

The lumber situation as a whole continues brisk but the outlook is somewhat perplexing and there is considerable speculation being indulged in regarding production for next year, where the desired quantities are going to come from and what the prices will be. Shipments are going ahead in a satisfactory manner and there is little complaint heard regarding car congestion. Now that all the mills have practically closed down, they will catch up in the matter of sending out their stock. More men will be available for shipping purposes and it is hoped that the woods labor will be replenished at many centres. Dressing mills which have been literally flooded with orders for planing and matching lumber, have now caught up and are accepting business so that factories requiring work lumber will be able to secure their requirements much more readily.

An example of the shortage in white pine is furnished in a statement by a leading Ontario organization which this year took the output of five mills, all of which sawed considerably more than last year, yet this company had 5,000,000 feet of lumber less to sell during the first week in November than it had on January 1st last year. This is a surprising state of affairs showing how low available stocks are in many districts; in other words production has been greater and sales far heavier than usual. In fact, ever since the 1st of April business with most lumber concerns has been the best on record. November and December are usually counted rather quiet months and it is not out of the ordinary that matters should slow down somewhat. Shipments of white pine to the other side of the line still continue actively.

In regard to hardwoods, there is a shortage in all lines, particularly in maple, elm, ash and birch, in both the thin and thick ends, and within the past few days a marked improvement has taken place in the demand for basswood. Prices are very firm and it is more a question of trying to get the stock than to get a price. The latter takes care of itself if the wholesaler and manufacturer has the goods required by automobile concerns, implement men, furniture manufacturers and others. Never were so many inquiries received for any "old thing at all."

It is reported that some of the logging jobbers in Quebec Province are paying their bushmen as high as \$100 a month and board, and if this is the case one can form some conception of the price that hardwoods will likely go next season. It means that manufacturers will, in all likelihood, be asking as much for their stocks as the wholesalers are receiving to-day for whatever quantities they have on hand.

A careful study of the whole situation reveals the fact that it is decidedly difficult to get any desired quantity of hardwood in a certain grade or thickness and carloads are mostly of the mixed variety. Some firms intend taking their price list off the market as they have not the stock to sell and they realize that, under no circumstances, can values descend. The outlook, so far in forest products, is strong and healthy and there is little fear with the improved shipping facilities for next season, the bright prospects for building and the increased use of wood in many directions, but quotations will go higher.

There will be no new stocks of dry lumber coming on the market before June 1st next and what will happen between now and that date it is impossible to foretell. Hardwood flooring companies are very busy, having more business than they can attend to or can secure stock for, and every woodworking establishment is running pretty well to capacity.

Retail lumbermen state that fall repairs have loomed up briskly in the country and the trade is naturally pleased at the Farmers' party coming into power at Queen's Park, Toronto. This all means better business for the communities in which they reside as there will be a general brightening up of farm premises, out-buildings and other structures.

The demand for Coast products is only fair and not a great deal of stuff is coming through owing to the activity of the United States market. There has been an increase in the base price of timber and shingles are a little easier. Laths are still very scarce and command any old price,—in fact it would be a shame to state what some of the holders of lath have been receiving for whatever consignments they can get their hands on.

Building continues actively and Toronto still leads the way. The City Architect reports the total value of permits issued in Oc-

tober to be \$2,400,000, or an increase of \$1,623,799 over October, 1918. There have been \$434,000 worth of factories erected this month and 400 garages valued at \$160,000.

The totals for October, rated as one of the biggest building months of the year, for the past eight years in Toronto are as follows:—1912, \$1,573,620; 1913, \$1,987,027; 1914, \$814,468; 1915, \$413,756; 1916, \$496,184; 1917, \$786,225; 1918, \$776,201; 1919, \$2,400,000.

Great Britain

No important change in the trading aspect during the past few days has taken place. The dominating feature of the market is the volume of stock that has arrived lately. Most of it has gone into store either on account of importers or shippers. The latter are holding out firmly for their valuations, and if these are not forthcoming the stock is yarded until such time as the demand becomes more active. The shippers' agents are confident that the demand will become active enough to absorb all their stocks of hardwood at advanced prices, and that before very long. Not while supplies are pouring in, of course, but when the import begins to tail off as it is expected soon to do. The position is interesting, if somewhat complex.

Whether it be due to the accumulation of arrivals, or simply that members of the London trade are inclined to take a "breather," it must be admitted that but slow progress has been made in buying and selling during the past week.

However, the certain knowledge that only a little more than a month remains within which to get goods forward from the Baltic ports will assuredly act as a stimulant during the last weeks, and those firms whose stock lists are somewhat "scrappy affairs" will seek to improve them by further purchases.

The announcement of the coming softwood sales has been received in London with a curious admixture of regrets and pleasure. The leading importers do not hesitate to condemn the action of the brokers, in scarcely polite terms, whereas the old habits of the sale rooms, who depended largely upon the catalogues for their requirements, are looking forward, with the utmost keenness, to the approaching sale.

To many members of the London trade, the coming of the timber exchange was looked upon as a useful foil to the auctions, because it was believed that constant contact between members of each branch of the trade would have led to greater freedom, and the necessity for public auctions would not have been urgent.

"It is, therefore, difficult to forecast the future of softwood sales and a timber exchange. Very frankly, we do not think the trade can regularly support a weekly auction and a weekly exchange," says a correspondent of the "Timber News," which, in reference to the Swedish market, says:

One of the most curious features of the soft-wood market to-day is the strong upward tendency of f.o.b. values. Wholly undeterred by the rivalry of the Finnish exporters, the Swedish shippers have steadily plodded along all through the summer, never yielding to pressure, and now, as the season draws to its close, f.o.b. quotations are advanced.

The late entry of French and Spanish buyers served to strengthen the shippers' hands, and now the Cape buyers are in the field, paying prices for deals which appear incredibly high for South Swedish productions.

The exporters have ideas regarding next f.o.w. values which will yet surprise the importers in this country.

Needless to say, the buyers in the United Kingdom will not be led astray by the undue optimism of the Swedish shippers, and it will therefore mean that a few months will elapse before negotiations are seriously entered into for f.o.w. cargoes.

It is, from many points of view, regrettable that quotations are soaring, because the markets are already difficult, even with values at their present level, and enhanced prices will only serve to complicate matters in the future.

Slowly but surely more boats are becoming available for wood cargoes. During the last few days the change has been quite noticeable, though for how long it is going to last is another matter. As the winter months approach an increased supply of tonnage naturally comes about owing to so many ports being closed to navigation. The offering of more boats may therefore be only temporary.

The best chance of getting lower rates is for competition to take place between the great English and American shipping companies. There has already been a whisper of something of the sort coming

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

about in the future. The sooner it takes place the better, from the charterer's point of view. The timber trade, at any rate, has had quite enough of exorbitant freights.

The export season has practically closed. All the lumber bought for Government account has been shipped from this port, while there is a comparatively small amount to go from Quebec, but this will be sent next season. A considerable amount is being exported from Halifax and St. John.

The pulp markets are very firm, mechanical is selling freely, and sulphite is also in demand. Newsprint is very scarce, with signs that prices will go considerably higher.

United States

Business has slowed down somewhat in many of the leading cities owing to the coal strike and labor unrest, as well as the falling off in the building line at this season of the year. There has also been considerable upsetting of market conditions owing to the \$10.00 penalty assessed against cars held for demurrage. The result is that numerous cars, which were in transit, were hastened to their destination, and, speaking of the recent action of the United States Railroad Administration in imposing this penalty, a leading paper says: There still continues to be something of a hysterical feeling in transit car circles, reflected in substantial concessions from market prices for cars which are near or at transfer points. For some reason which has not been clearly explained dimension constitutes a very large proportion of all transit shipments. A month ago many transit cars did not have 50 pieces each of 14, 16, or 18 foot lengths. In some cases these very desirable lengths were entirely omitted. Now a good share of the cars are very evenly balanced.

It is particularly noticeable that both in assortment and quality the consignments included in transit car shipments are much better than before the announcement that a severe penalty would be imposed.

During the week there has been a very material reduction in the number of transit cars loaded with lumber being offered to the trade in many commercial centres. There seems to be quite a radical difference of opinion among jobbers as to the reason for this substantial shutting off of the supply. Some of the brokers insist that this is the off season for transit cars, as shippers do not care to run the risk of having material come into the market after winter has set in, because the chances are that it will have to be unloaded and remain in storage until next spring. Other handlers of transit cars insist that there are still at least 30 days remaining, during which time the dealers could take on a reasonable amount of transit material, due to the fact that there has been no perceptible let-up in the consumers' trade. This latter class of jobbers frankly state that the

\$10.00 penalty for holding cars at transfer points is the real cause why many concerns on the coast have discontinued putting lumber in transit and others have cut in two the number of cars they had been sending on.

Scarcity of stocks at the mills and inadequacy of railroad service are large contributors to the present low volume of lumber movement. Of course, retail yards are not buying a great deal of lumber with winter at hand, but there is some disposition to look ahead, as next year promises to be even more active in building circles. Many wise buyers are placing orders for stock now, and are willing to take it as soon as it can be shipped. Millmen are not inclined to take business at the present market level for shipment after first of the year. They got their fill of that kind of business this year and have been shipping lumber at a loss for months.

Some mills in various parts of the country report enough business on hand to keep them busy for the remainder of the year. The chief obstacle at present is the car shortage. Only about thirty to fifty per cent. of required equipment is being supplied by the railroads, and the coal emergency is reducing the percentage. There was some softening in both the southern pine and the western markets a few weeks ago, but that period has apparently passed, and quotations for mill shipment are approaching the highest level known this year.

The hardwood market shows even greater activity than heretofore, and while transactions have been curtailed somewhat by the car shortage the week has been an excellent one for sellers. Price advances, particularly on the better grades, are reported from the majority of the large buying centres. With stocks scarce and production barely keeping up to previous levels the future will undoubtedly see a continuation of the present situation. Factory buyers are the most active and lumber is being sought especially by the flooring manufacturers, who are unable to supply the demand.

So far this year production of southern pine has exceeded orders booked by less than normal production for two weeks, while the mills still have on hand unfilled orders which it will take at least six weeks to fill. Consequently, it is not surprising that the market shows a firmer tendency with the belief becoming general that the low point of the recent softening has been reached. Manufacturers in all sincerity believe that because of conditions which are outside of their control production can not be greatly stimulated and that the demand will equal, if it does not exceed, the supply, and consequently are not worrying about getting business. Weather conditions have improved and as a result the production outlook is better, but log supplies are low at many mills. The car situation is by no means the best and this is hindering business to a considerable extent.

Market Correspondence

SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD

Conditions Remain Unchanged on St. John Market

The last two weeks has seen little if any change in the lumber situation at St. John. The mills are still sawing on old contracts. No shipments from the city mills are taking place, and when the season closes they will all have a very large stock of sawn lumber piled on their wharves, mostly all of which had been sold in the early Spring to the British Government and is being paid for as sawn to date.

No new contracts or sales for deals to be sawn in 1920 have been made, and evidently no one wishes to speculate in buying for 1920 delivery. The mills are all arranging to have normal cuts in 1920, and have crews in the woods getting out logs. The cut on the Upper St. John will be for St. John mills, the same as in 1919, about 40 million feet. The balance of the cut will be made on the lower reaches of the St. John.

Prices for logging have been arranged for at about same as paid in 1918-19, and, as men are becoming more plentiful, it looks as if the operators will not have to pay as high wages as in 1918. This, of course, will be offset by increases in provisions for man and beast, which are higher than a year ago. Many of the rotary mills which arranged to go in for full cuts during the early Fall have cut down their quantities and will, therefore, not take out as much sawn lumber as was anticipated. This is caused by the stand taken by the deal buyers in which they refuse to speculate in contracts at any set price for next year's cut.

Local business remains good and the factories have orders for some time to come and should be busier than last winter. Prices locally remain unchanged. Local business at St. John should be better than for some years past, and the future holds a bright outlook. Numerous plans are in progress for building during 1920. Many

houses are needed and with the municipal and city commission housing schemes being now arranged for, it certainly looks as if the Spring and Summer of 1920 should find a large amount of work.

Laths are impossible to find at any price. Shingles are also very scarce, especially in the higher grades.

Montreal Business is Steady—Good Outlook

Montreal lumber market conditions continue to be satisfactory, taken as a whole. Here and there it is reported that trade has slackened, but this is only natural at this season, when yards are not inclined to order in any large quantities in view of the lull that takes place in building during the winter.

Indications are that next year's cut in the province will be on a larger scale, providing that the labor is available. That will be the important factor. One manufacturer states that he sees little improvement in this respect. Men have not yet settled down, and the tendency is still to jump from job to job.

American orders have declined. Advices from the New England States are to the effect that the yards have large stocks on hand, that shipments are still arriving, and that for the time being there is no inclination to do further buying. The season for sending large shipments via the canals is now closed.

B. C. stocks are selling slowly, except timber, for which the base price has been again advanced. Shingles are dull and cheaper.

Hardwoods are a better market, with limited supplies. Pulpwood is being bought, but prices are uncertain.

Local sash and door firms are well supplied with orders, and the box-makers are fairly busy.

The outlook in the building trade is very good, and with the settlement of labor troubles there should be an excellent opening in

the spring. A committee of the Builders' Exchange has been appointed to stabilize conditions next season. Architects have a considerable amount of work in hand, and if the provincial housing schemes materialize, the demand for lumber next season will be on a large scale. The public has evidently come to the conclusion that costs will not come down, and that there is no use waiting for cheaper production. The Montreal permits for last month totalled \$1,519,892, an increase of \$1,140,842,—this, following on a number of previous substantial increases, indicates that the revival is no mere flash in the pan. For the ten months the permits amounted to \$8,484,636, a gain of \$4,117,283.

Purchases Playfair Mill at Midland

Z. Mageau, M.L.A., of Sturgeon Falls, has purchased the old Playfair & White mill at Midland, Ont. This mill has not been in operation for some time. Some of the equipment, such as band saw, steel carriage, band re-saw, 400 h.p. engine and a boiler or two, will be used in the mill of the Field Lumber Co. at Field, Ont., on the C. N. R. main line. The name of the latter concern has just been changed to the Mageau Lumber Co. Limited, and the capacity of the plant will be increased to 50,000 feet a day.

New Sawmill Going Up at Douglastown

The Miramichi Lumber Co., Chatham, N. B., are erecting a new mill at Douglastown on the site of the old Hutchison mill. The equipment consists of a double cutting band and a Yates re-saw, and everything will be entirely new. The company expect to saw about 75,000 feet per day.

In regard to logging operations, the company state they are not cutting as much as usual, only about 30,000,000 feet. They are not ating three camps of their own, and the balance is being carried out by jobbers. The cost of the logging will run from 10 per cent. to 15 per cent. more than last year. The officers of the Miramichi Lumber Co. are G. F. Underwood, President; J. P. Riley, Vice-President; J. W. Brankley, General Manager; W. P. Eaton, Resident Manager.

Managers Visit the Government Nursery

The managers of the Province of Quebec Fire Protective Associations were recently the guests of Mr. G. C. Piche, Chief Forester, at the Government Nursery of Berthierville. They inspected the nursery, visited the experimental cuttings, and discussed various subjects. The following day they visited Lachute and inspected some plantings of spruce and Scotch pine made on the drifting sands.

The Laurentide Co., Ltd., Grand 'Mere, and the Wayagamack Pulp & Paper Co., Three Rivers, P. Q., have each purchased three Cleveland tractors. Heretofore all the logging work of the companies has been done by men and horses in the woods.

Messrs. Hanssen and Faulkner, of the Forestry Division of the Laurentide Co., Grand 'Mere, Que., have made an intensive timber survey of the Mekinac limit and report some good reproductions of the old burns.

C. A. Moyle, chief engineer of the Riordon Pulp & Paper Co., recently visited the plant of the Laurentide Co., Grand 'Mere.

Activities of National Lumber Dealers

A meeting of the Executive Committee of the National Wholesale Lumber Dealers Association was held at No. 66 Broadway recently in New York, the following being present: H. F. Taylor, President, Buffalo, N. Y., J. W. McClure, Memphis, Tenn., F. R. Babcock, Pittsburg, Pa., H. W. McDonough, Boston, Mass., W. G. Power, St. Pacome, Que., C. A. Goodman, Marinette, Wis., Trustees, E. F. Perry, Secretary, W. W. Schupner, Department Manager, W. S. Phippen, Traffic Manager.

A number of matters were considered, among the most important being that in connection with the transit car situation. The reports of J. W. McClure, C. A. Goodman and Secretary Perry of the Committee appointed to represent the Association at the International Trade Conference at Atlantic City, were most interesting, and action was taken with a view of emphasizing the desirability of a closer relation on the part of the lumber industry in the work of the Chamber of Commerce of the United States. This will be conducted in co-operation with other lumber associations. The reports of special committees carrying out the provisions of Referendum No. 28 of the Chamber of Commerce of the United States showed progress and of the "Our Country First" conference at Chicago by H. H. Hettler and the National Retail Lumber Dealers Association at Detroit were received. The Executive Committee also endorsed the action of the National Lumber Manufacturers Association requesting an appropriation from Congress for the housing and maintenance of the Forest Products Laboratory of the United States Department of Agriculture. The Committee on union with the Na-

tional Bureau of Wholesale Lumber Distributors reported progress.

The departmental activities of the Association through the Bureau of Information and Transportation Bureau were fully covered and indicated a large amount of important work handled for members. A substantial gain in membership is reported, the total now reaching 461, the largest in the history of the Association.

Personal Paragraphs of Interest

S. Bick of the Bennett Lumber Co., Limited, Montreal, is on a visit to England.

G. I. Jones of the Jones Hardwood Co., Boston, spent a few days in Toronto recently on business.

F. C. Hooton, Manager of the Strable Lumber & Salt Co., Saginaw, Mich., spent a few days in Toronto calling upon the trade.

Mrs. Firstbrook, wife of Mr. John Firstbrook, President of Firstbrook Bros. Limited, box manufacturers, Toronto, passed away recently.

A. N. Dudley of Toronto, Secretary-Treasurer of the Hobel Hunt Club, has been spending the past few weeks on a deer-hunting expedition north of Spragge, Ont.

J. P. Johnson, W. J. Lovering and Dr. Kemp of Toronto, have been enjoying a successful deer-hunting expedition at Swamp Lake, near Mount Irwin, Peterboro County.

Gilbert Brocklebank, representing C. V. Haerem, Manchester, Eng., was in Toronto recently on his way to the Pacific Coast where he will look into the lumber export situation.

Mrs. Frank Pauze, wife of Mr. Frank Pauze, of U. Pauze and Fils, lumber merchants and manufacturers of interior trim, Montreal, died on October 31, aged 51. She leaves four children.

Frank J. Hathway, President of the French Bay Lumber Co., Limited, Sault Ste. Marie, Ont., who are manufacturers of hardwood lumber, was in Toronto recently calling upon the trade.

A. E. Gordon of Terry & Gordon, Toronto, and Arthur Eastcott, Manager of the Pembroke Lumber Co., Pembroke, have returned from a successful deer-hunting expedition near Mattawa.

H. J. Plunkett of the Plunkett-Webster Lumber Co., wholesale lumber merchants, New York, spent a few days in Toronto lately on business in connection with the purchase of Canadian hardwoods.

E. Roberge, manager of the Exchange Lumber Co., Montreal, has been on a selling trip to Boston, and Leon Gagne, jr., of the same company, has visited New York, Philadelphia and other points in the U. S.

The many friends of W. C. Thuerck, of Hailevburv, Ont., will sympathize with him in the death of his little daughter from diphtheria. Mr. Thuerck has for some years been a member of the staff of Terry & Gordon, Toronto.

Hon. Beniah Bowman, who was elected as a U. F. O. member of the Ontario Legislature for Manitoulin Island, is the new Minister of Lands, Forests and Mines in the cabinet of Premier E. C. Drury and succeeds Hon. G. Howard Ferguson who will be the leader of the Conservatives in the Legislative Assembly.

F. H. Pont, of the firm of Wm. Pont, lumber merchants, Zaanadam, Holland, who was in Toronto recently on his way home from a trip through the timber belts of the Dominion, stated that his firm were contemplating entering the lumber business in Canada if conditions in Russia, where it had previously had large interests, did not soon improve.

G. W. White of G. W. White & Son, Watertown, J. S. Caldwell, Syracuse, James B. Cleveland of Johnston & Murray, Watertown, and O. M. Thomson, Syracuse, N. Y. state representative of the Union Lumber Co., Toronto, were in Toronto recently on their return from a deer-shooting expedition at Mileage 44 on the T. & N. O. Ry. The party had a splendid time and report fairly good luck. There was about four inches of snow on the ground in that section early in November.

Herbert L. Hebard, who has been appointed Inspector of the National Hardwood Lumber Association for Toronto and district, succeeding John J. Miller, is already well known to a large number of lumbermen, and during the comparatively short period that he was assisting Mr. Miller, made a large number of friends. Mr. Hebard was born in Boston, Mass., and up to the time of coming to Toronto had always been a resident in that city. He was educated at the public schools of Boston, being graduated from the High School in 1906. Mr. Hebard then went to work for J. M. Woods & Co., East Cambridge, Mass., and was with them as an inspector up to the time that he entered the service of the National Hardwood Lumber Association.

Thousands of sawyers will tell you of their experiences with other saws before they permanently selected Disston High-Grade Cross-Cut Saws.

They will tell you of hard work with others saws that "bind" and won't "take hold."

Usually, they also speak of having tried saws that wouldn't hold their set in "hard cutting."

Then, too, they sometimes say they lost much time with saws that had to be sharpened "every time you turn around."

Now these men insist on Disston Cross-Cut Saws—they know that to use an inferior saw is to waste time and energy.

HENRY DISSTON & SONS, INC., TORONTO, CANADA

Branch: Vancouver, B. C.

All Disston Cross-Cut Saws are made of a special grade of Disston Crucible Steel—an exclusive Disston product—made only in the Disston plant.

It is the strength and edge-holding qualities of this famous saw steel, combined with right design and workmanship, that has enabled Disston to maintain acknowledged leadership in saw making for nearly eighty years.

DISSTON-SAWS

Advertising is Business Insurance

A large manufacturer who, during the war, devoted his entire plant to war-work, kept his advertising running continuously, although he could not fill a single order. When asked why he did it, he said that he was insuring a market for his product when he returned to his regular lines. He has since reverted to his pre-war products and his plant is running to full capacity with more business in sight than he can handle.

Advertising was business insurance for him.

Logging Regulations on Crown Lands

Hon. E. A. Smith, Minister of Lands and Mines for New Brunswick, has issued the following logging regulations with respect to the cutting of timber on Crown lands of the province:

Diameter Limit—

No sound butted tree smaller than the following diameters measured inside the bark at a point not less than twelve inches from the ground shall be cut:—Spruce, white and red pine, twelve inches; princess or jack pine, ten inches. (Penalty fifty cents per tree in addition to regular stumpage.)

No Undersized Cutting on Spruce Barrens and Slow Growing Thickets—

shall take place without written permission from the Crown Land Office. A charge not exceeding fifty cents per thousand in addition to stumpage will be made to cover cost of supervision.

Stump Height—

All sound butted trees must be cut as low as possible and never higher than sixteen inches regardless of snow conditions. (Penalty twenty-five cents per tree.)

Saw to be Used—

The saw shall be used in felling trees and cutting them into logs; if the axe is used the length for scaling shall be taken from point to point being the extreme length of the log.

Trimming Allowance on Logs—

Six inches over-run in the length of a log shall be the maximum allowance made for trimming; if this is exceeded the log will be scaled as one foot longer.

Size of Tops—

All tops shall be taken out to as low a diameter as possible. Spruce tops 6 inches in diameter is the maximum allowed except in case of very bushy top when 7 inches will be allowed. Fir 6 inch top is the maximum allowed. White and red pine 7 inch top is the maximum allowed. (Penalty \$7.50 per thousand feet.)

Mixing Logs—

Logs cut on Crown Lands shall be placed in separate brows from those cut on Granted Lands and shall be marked with a different mark.

Skids, Roads, Bridges, Camps, Hovels—

No spruce, white or red pine shall be used as skids or in the building of roads or bridges where other species are available. Where soft wood must be used fir must be taken in preference to spruce. (Penalty \$7.50 per thousand feet.)

Trees Wholly Killed by Spruce Bud Worm or Fire—

must be yarded and browed separately from living trees in order to obtain the two-thirds rate of stumpage; otherwise the full rate will be charged.

Lodged and Burned Trees and Windfalls—

All lodged trees, all spruce and white and red pine necessarily cut out of roads, yards, landings, etc., and any dead, burnt or blown down trees suitable for lumber shall be taken out. (Penalty \$7.50 per thousand feet.)

Protect Young Growth—

All reasonable care must be taken to prevent injury to young spruce trees below the diameter limit.

Scalers are sworn to report all violations of the Game Laws coming under their notice.

Many Activities of the Busy East

The Boony River Lumber Company intend to cut two million of lumber on property about Mill Lake, N. B. this winter. Roscoe Burgess and Matt McKay have taken contracts for one million each. The mill now operated in St. George, N. B., will be moved into the woods and the lumber will be manufactured there. Sawing operations will be in charge of George Patterson, who owns the mill. The company also have a crew in at Piskechegan. This output will be brought down the river and manufactured at St. George.

W. H. Harrison, Gladys Leslie Welsford and Leah Edna Gaskin of St. John, have been incorporated to carry on a general lumber and pulp wood business with head office in Fredericton, N. B., and a total capital stock of \$24,500, under the name of the United Lumber, Limited. These same persons have also been authorized to carry on lumber business under the name of the Atlas Lumber Company Limited.

The New Brunswick department of Lands and Mines has received from the Laurentide Pulp and Paper Company of Quebec information concerning the results of experiments carried on by it in the use of hard woods in the manufacture of pulp-wood. Hardwoods, such as birch, beech, maple, etc., were experimented with and con-

trary to the general opinion were found to be suitable for the manufacture of excellent grades of pulp. The information has been received with great interest as hardwoods constitute some thirty per cent. of the forest growth of New Brunswick. Hon. E. A. Smith, minister of Lands and Mines, is much interested in the matter and it will be followed up with a view to having hardwoods utilized in the province for the making of pulp.

Four vacant lots of crown lands were sold at the Crown Lands office, Fredericton, a few days ago. In the county of Gloucester twenty-five acres at the northern end of Miscou Island was bid in by George Vibert at \$1.60 per acre. There was some keen bidding on this lot. In Northumberland County sixty-two acres on the southern side of Allanville Settlement was bid in by trustees of the school district at \$1.00 per acre. Three acres on the road from Chatham to Burnt Church at Grand Dune was bid in by Jules Gouvereau at the upset price of \$2.00 per acre. In Kent forty-two acres north of west branch of St. Nicholas river was bid in by Robert M. Mundle at the upset price of \$4.00 per acre.

Lumber shipments from St. John have been comparatively small for some time only sailing vessels occasionally taking away cargoes. A few days ago the Barque Montrose, 984 tons, sailed for London, England, with 854,304 feet of deals valued at \$33,826. The lumber was shipped by George McKean & Company Ltd.

Word was received in St. John by the Furness Withy Steamship Line that the S. S. Cape Premier has sailed from Glasgow on November 5. She is enroute to St. John to carry a cargo of lumber overseas for Stetson, Cutler & Company.

Indications point to a very heavy cut of lumber in New Brunswick this winter. It will be heavy on both crown lands and private owned lands. The decision to cut more lumber is said to be the result of indications in the world market that there will be a tremendous demand next year. France and Belgium are expected to have requirements for reconstruction and the United States and British markets are expected to be under supplied.

During the last season there has been a steady movement of manufactured lumber overseas from various New Brunswick ports, but scarcity of shipping retards that movement to quite an extent. The shipping situation will gradually improve and the expectation is that the huge quantities of manufactured lumber, which has been piled on the mill-yards all over the province, some of it for more than one season, will be cleared in 1920. The labor situation as far as the lumber woods is concerned is said to be satisfactory.

Col. T. G. Loggie, Deputy Minister of Lands and Mines for New Brunswick, announces that the construction of the telephone line up the Nepisiguit River from Bathurst, which has been delayed by the non-arrival of the wire until a few days ago, has now been commenced and several miles of line have already been strung. This line will penetrate about 70 miles from Bathurst into the very centre of the province and is part of the policy of constructing woods telephone lines and lookouts in the interests of better fire protection in New Brunswick.

The construction is being carried out by the Bathurst Lumber Company according to a standard agreed on, and the cost is equally divided between the Forest Service and the Bathurst Lumber Company. The actual work is under the supervision of Mr. Mathias Cloutier, of St. Eugene, Que., who has had extensive experience in the construction of tree telephone lines, and who has been loaned to New Brunswick for this purpose.

Mr. H. C. Kinghorn, of the Forest Service, and Mr. D. R. Morrison, an experienced lineman from St. John, left recently to work on the line a few days to familiarize themselves with the method of construction. They will then start the construction of a 40 mile line in the centre of Northumberland County which is designed to connect with a new lookout to be constructed in Bald Mountain. This is expected to be one of the best lookouts in the Province, a very extensive area being visible from it. It is hoped to finish this line and also a line in Victoria County to connect with a new lookout to be placed on Blue Mountain.

Big Shipyard Plant is on the Market

After erecting a six-way shipyard with all necessary mechanical appliances and factories, spending \$2,500,000 in wages and utilizing 22,000,000 feet of British Columbia fir in wooden ship-building in twenty-seven months, the William Lyall shipyards plant of North Vancouver, B. C., has completed its work, finds no more contracts available and is now advertised for sale. A great wartime industry has come to an end after producing over 40,000 tons of wooden shipping most of the vessels being now at sea.

EDGINGS

Ontario

E. H. Mann & Co. of Peterboro will erect a new saw-mill on Otonabee St., Peterboro:

The Kelly Lumber Co. of Bridgenorth, Ont., intend erecting a saw mill in Lakefield, Ont.

Chas. Boaz of Clayton, Ont., has built a cement flume under his saw-mill and carried out other improvements to the plant.

John McLellan, a well-known lumberman, has purchased the planing mill property in Harriston, Ont., belonging to the estate of the late George Gray & Co., and will operate the same. The industry is one of the oldest in Harriston.

The Fesserton Timber Co. of Toronto, recently purchased 2,000,000 feet of jack pine and spruce from the International Land & Lumber Co., Ottawa. About 75 per-cent. of the quantity secured is jack pine and the remainder spruce. The lumber was sawn at St. Felicien, Lake St. John District, Que.

The Victoria Harbor Lumber Co. of Victoria Harbor, Ont., recently finished sawing for the season and had a very good operating year although the cut was not as large as in 1918. The company are conducting six camps this season, and will take out considerably more timber than last winter.

Handsomely-framed certificates of the membership of the Lumbermen's Credit Bureau, Inc. of Toronto, have been sent out to the members and now adorn the walls of their respective offices. The Lumbermen's Credit Bureau is in a flourishing condition at the present time and has forty-three members, the largest in its history.

A charter has been granted to the La Sarre Lumber Co., Limited, with a capital stock of \$75,000 and headquarters in Toronto. The company is empowered to buy, sell and deal in timber and wood and to conduct the business of timbermen, sawmillers and lumbermen and operate saw and planing mills. Among the provisional incorporators are James M. Forgie, C. A. St. C. McKay, W. B. Sturup and T. S. H. Giles of Toronto.

A charter has been granted to the Kenora Lumber Co. with a capital stock of \$200,000 and headquarters in the town of Kenora. The company is empowered to carry on in all its branches a lumber, timber and pulpwood business, and to manufacture, buy, sell and deal in timber, logs, lumber and wood of all kinds. The provisional directors are Henry P. Cook and Rupert H. Moore of Kenora.

Seaman, Kent Co., Limited, of Toronto, have purchased the large factory formerly owned by the West Lorne Wagon Works at West Lorne, Ont. and will convert the building into a plant for turning out oak flooring exclusively. This will make five plants, the output of which is controlled by Seaman, Kent Co. They are very busy at all their factories and have been doing considerable export trade, although owing to the scarcity of hardwoods, they have turned down a number of orders from the Old Country.

A charter has been granted to Thomson Bros. Limited, with a capital stock of \$60,000 and headquarters in Toronto, to carry on a general contracting and construction business and also to manufacture and deal in building materials and to conduct the business of a lumber, saw and planing miller and manufacturer of lumber and woodenware. The incorporators are—James Bruce Thomson, Thomas Thomson, Wm. R. Thomson, Allan G. Thomson and James G. Thomson, all of Toronto.

The Parkdale Lumber Co., with a capital stock of \$20,000, has been granted a charter to carry on the business of timber merchants, saw-mill proprietors and timber growers, and to import, export and deal in timber and wood of all kinds. The headquarters of the company are at Dunchurch, District of Parry Sound, Ont., and the provisional directors are—John H. Hosick, Dunchurch, James Hall, Toronto, James Hosick, Vernon E. Steele and James F. Ross of Port Colborne.

A provincial charter has been granted the Lakefield Canoe & Boat Club. The headquarters of the company are at Lakefield, Ont., and the capital stock is \$50,000. The company is empowered to manufacture, buy, sell and deal in canoes and boats of every kind and to buy, sell and generally deal in wood, timber and lumber. It is understood that the Lakefield Canoe & Boat Club will take over the assets and business formerly carried on by the Lakefield Canoe Co. The incorporators of the company are—Wm. J. Rooney, Douglas T. Chamberlain, Chas. H. Manaton of Lakefield.

Eastern Canada

The Kipawa Fibre plant at Temiskaming is expected to be in operation making pulp next month. The company have just awarded a contract for several houses as part of an industrial housing scheme.

A provincial charter has been granted to Gagnon & Fils & Cie, Ltee., with headquarters at Saint George in the county of Beauce, Que., and a capital stock of \$99,500. Among the powers conferred on the company is to deal in pulp, paper and wood and the general manufacture and production of lumber. Sir Joseph Gagnon is at the head of the company.

The Ste. Anne Lumber Co., with a capital stock of five hundred thousand dollars and head offices in Montreal, has been incorporated to buy, sell and deal in timber, lumber, paper and pulp wood and to operate mills in this line. Among the provisional incorporators are Linton Hossie Ballantyne, Francis George Bush, and Herbert W. Jackson of Montreal.

La Compagnie de Meubles de Matane, Limitee, has been granted a charter with a capital stock of \$49,000 to deal in lumber, timber limits, etc., as well as operate planing mills, saw mills, etc. The provisional directors are Joseph A. Malenfant, H. Charest, P. Bouffard, and Hector Gagnon, all of Matane, Que., where the headquarters of the company are located.

The Federal Lumber Co., Limited, with headquarters at Sherbrooke, Que., and a capital stock of \$95,000 has been incorporated to manufacture,

sell and deal in all kinds of pulp, paper, lumber and to own, hold and operate timber limits and to conduct the business of lumbering in all its branches. Among the provisional directors are R. A. Oughtred, John P. Wells, Charles D. White and Walter H. Lynch, all of Sherbrooke.

A charter has been granted to the Great Eastern Paper Co. Limited, Montreal, with a capital stock of \$5,000,000 to carry on the business of lumbering and the lumber trade in all its branches and all other business incidental thereto, and to manufacture and deal in logs, lumber, timber, pulp, pulpwood, paper, etc. The incorporators are John W. Cook, K.C., Allen A. Magee, T. B. Heney and M. Goudrault and others.

Men are going to the lumber camps daily, and are getting from \$75 to \$90 a month. Men are coming out daily also. Having earned a month's pay they feel rich enough and come out of the woods to spend their wealth. Woodsmen demand higher wages from jobbers who contract to get out lumber by the thousand than they do from the lumber firms, as they say that they have to work harder for contractors than for the big concerns.

It is the intention of the Quebec Provincial Government carefully to survey the cutting of timber throughout the lumber camps of the province. A large number of inspectors from the Department of Lands and Forests under the direction of Mr. G. C. Piche, chief of the forestry service, have started their organization and will visit more than two thousand of these camps during the coming winter. Infractions of the law will be severely dealt with.

Annie Frances Coughlan, J. D. Pollard Lewin and James J. Stothart, all of St. John, have been incorporated to carry on a shipbuilding business under the name of New Brunswick Shipbuilding Co., Ltd., with capital stock of \$320,000, and head office in St. John. The same three persons have been authorized to carry on shipbuilding under the name of St. Martins Shipbuilding Company, Limited, with capital stock of \$140,000, and head office at St. Martins.

Elwood Burt, lumberman, has paid \$50,000 for a block of approximately 9,000 acres in the Keswick district, N. B. The owner of the property has been John A. Weatherbee, of Bangor, Maine, and the block adjoins another that is also owned by Maine interests. As well as the standing lumber on the property there are some 5,000 cords of pulpwood. It is Mr. Burt's intention to carry on lumbering operations on his new property for his mill at Cardigan, N. B.

Natagan Lumber Co. Limited, has been incorporated with a capital stock of \$49,900 and chief place of business at Barraute, Que. The company is empowered to buy, sell and deal in all kinds of wood, and to conduct business as saw-mill operators, planing mill, shingle mills, etc., and also logging operations. The incorporators are, Henri Grandbois of St. Casimir, Albert Lainesse of Lemieux and P. D. Cloutier, J. Alfred Gagnon, J. A. Mireault of St. Prosper de Champlain.

Western Canada

The Cameron Lumber Co. of Garbelly Road, Vancouver, are erecting a new drying kiln.

The Haywood Lumber Co. of Edmonton have had plans drawn up for the erection of offices and the laying out of a lumber yard at Bellis, Alta.

January 28-30 are the dates on which it has been arranged to hold the 1920 convention of the Western Retail Lumbermen's Association in Winnipeg.

Shipbuilding continues active at Prince Rupert. The keel of the first steamer to be built has been completed and the keel of the second half finished.

The head office of Canadian Lumber Yards, Limited, so it has been decided by the directors, will be in Vancouver, B. C. This decision was arrived at at a meeting held recently in Montreal.

Mr. Hudson of Everett, Wash., was recently in British Columbia looking to the establishment of a pulp and paper mill at Squamish, the coast terminal of the Pacific Great Eastern Railway Company.

It is reported that the Dominion Government plans to place contracts for fifty wooden schooners with British Columbia shipyards. According to the report, twenty-six of the ships will be constructed at Victoria, and the others will be turned out by yards on the mainland.

The Imperial Lumber Co. are making great alterations to their Wawanesa yards which are nearing completion. A long new coal shed has been built and a new office and timber shed are in course of erection. H. E. Mitchell is the manager of the Wawanesa yards and reports business as good in his section of Manitoba.

More than 12,000,000 feet of the British order of 70,500,000 feet of British Columbia lumber is now en route to England. The representative of the British government hopes to have 40,000,000 feet on the way over by the end of the year, according to information received by the department of immigration and colonization.

The number of local industries in Prince Rupert will shortly be augmented by a new saw mill which is being erected for Olaf Hanson and R. E. Allen. Mr. Hanson is an experienced lumberman and Mr. Allen was for several years at Hazelton as chief forester in the Forestry Department. The mill is being equipped with a box factory in addition to the ordinary plant for producing commercial lumber from their own timber limits.

The Canada Timber and Land Co., of Toronto, of which E. Stewart is manager, have been busy cutting logs on their limits on the Tobin river, 120 miles north of Vancouver and have already taken out about two million feet of cedar logs and this quantity will be greatly increased. Difficulty has been experienced in getting the logs to the mills owing to the low water which prevails in many parts of the Pacific Coast province due to the dry season.

Announcement was made recently by H. H. Elliott of the White Shore Chemical Co., that active work would be started very soon on the development of the sodium sulphate deposits on the shore of Lake White Shore. This is the largest deposit in the Dominion and according to Mr. Elliott its use will revolutionize the pulp making industry in Canada. It will increase the output of by-products of the pulp mills from 12 as at present to more than 40, it is stated, most important of these being artificial silk, which can be manufactured from the pulp. The mine is situated northwest of Biggar, west of Oban and close to both the G. T. P. and C. P. R. Shipments will commence early next year.

Manufacturing All Kinds of Special Shapes in Refractories

Remember, we are making all our own blocks and making a specialty of special shapes.

We are using a high grade fire clay, which is the factor of supreme importance in all processes of manufacture. Our burners are experts. When you are in the market be sure and write us as we know you will find our proposition interesting.

Our stoker arches are designed to promote combustion and give longer life.

Our door arches and jambs are made to withstand the

strong-armed boy with the slice bar.

Our side wall blocks are made to eliminate the many joints that clinkers stick to, when ordinary fire brick is used. They give longer life and reduce air leaks to a minimum.

We designed these arches and blocks so that any handy man could replace same in half the time that it takes to repair a standard fire brick job.

Remember, Gates' blocks means cutting your cost of up-keep and fuel bills.

High Temperature Fire Clay for Emergency Repairs.

We specialize in all kinds of POWER PLANT BRICK WORK

Call on our engineers at any time for information you may require; their services are offered to you without obligation.

**Reasons
Why
You Should Use**

ATKINS STERLING QUALITY SAWS

Reason No. 1—ATKINS STEEL

Reason No. 2—ATKINS WORKMANSHIP

Reason No. 3 -- **The Temper**

"DRAWING THE TEMPER" of an Atkins' Saw is a study in itself. Experts who have made this particular work their life-long practise give direct personal supervision, and the final touch which could make or mar the steel is given with that exacting care characteristic of the complete manufacture.

It is the Atkins' method of tempering that gives the stamina to the steel and adds a toughness to its Sterling Quality, which makes Atkins' Saws second to none when put to the real test for cutting power and length of service. You will always find the temper of an Atkins' just right.

Peeling Potatoes

requires much labour—all the way from one to five men or more, according to the size of the camp being assigned to this work—furthermore, there is a great waste in hand peeling—it has been proved from 20% to 30%.

The Cyclone Vegetable Peeler

will peel and wash a bag of potatoes in from three to five minutes, and effect a saving of from 25% to 40% on material alone. Write for circular "L."

The Largest Veneer Lathe in the World is a Coe

This one, operated in the South, cuts large hardwood logs 200 inches long, the veneer leaving the machine of the required thickness in a wide continuous and smooth sheet.

Out in the Great Pacific Northwest, where the giant Spruce and Fir trees grow, Coe Lathes are cutting logs 7 ft. in diameter and over 10 feet long into veneers of various thicknesses.

These large improved machines are the result of our 67 years continuous experience specializing on veneer manufacturing problems throughout the world. Our organization and modern plant facilities enable us to design and build large or special size machines to meet the most exacting veneer requirements.

Put your veneer cutting problems up to us. Our experience and service are at your disposal.

Have you a copy of our new Bulletin No. 101 on the drying of veneers without defects?

Hose as modern as the Cord Tire

Go back to the days before Goodyear undertook to produce better hose, and you will find that rubber hose was built in much the same way that most hose is to-day.

An old-fashioned product. Good enough for those times, perhaps, but inadequate to meet modern standards of efficiency.

Goodyear opened a new era in the industry. Goodyear disregarded tradition. Goodyear's engineers started from the ground up to build hose of modern efficiency to meet modern needs.

The inevitable result of such methods was the development of better materials and improved hose construction.

Old ideas and old methods were forgotten. Goodyear Hose was built as if hose had never been built before. Modern industry's hose needs was the standard built to.

Is it any wonder, then, that the quality of Goodyear Industrial Hose dominates as does the quality of Goodyear Cord Tires?

Is it any wonder that Goodyear Hose gives longer, more satisfactory service and costs less in the end?

Goodyear builds a particular hose for every industrial purpose—water, steam, pneumatic tool, air drill, railway, fire, suction, and so on.

Let a man trained by Goodyear study your hose problem. Phone, wire or write the nearest branch.

GOOD YEAR
MADE IN CANADA
INDUSTRIAL HOSE

1880 Nearly Forty Years Ago 1919

"Nothing shall be wanting on our part to make this journal a full and complete record of the lumber business and all that relates to the trade in Canada."

IN setting forth the reasons for the coming into existence of the Canada Lumberman and Woodworker on October 15th, 1880, the publishers made the above declaration. It constituted the purpose for the establishment of the paper which was to reflect the thought and development of the Canadian lumber industry—destined to occupy the enviable position of the National Lumber Paper of Canada.

That its existence has been justified is evidenced by the interest evinced by those connected with the lumber industry in each issue.

The Canada Lumberman—the paper with the green cover—is to be found prominently displayed in the offices of lumbermen from the Atlantic to the Pacific.

It is read thoroughly and each succeeding issue is eagerly awaited by our subscribers.

It is the medium through which to keep in close touch with the activity of the lumber industry and its numerous branches.

It is considered an authority on matters appertaining to the Canadian lumber industry.

Times Have Changed

When the Canada Lumberman was first published, advertising was in its infancy in Canada. Manufacturers did not fully recognize the value of placing the merits of their product before the particular field they wished to reach. If any advertiser had attempted to run a full page advertise-

ment he might have been considered as on the road to bankruptcy.

But times have changed—the advertiser of 1880 who used card space is the full page advertiser of today. These manufacturers realize that advertising is an integral factor in their selling plan—that it can be entered upon with far greater assurance of success than most business procedures.

You can reach the owners and operators of logging camps and saw mills, wholesale and retail lumber dealers, etc., in all parts of Canada—the big buying power of the lumber industry—through the columns of the Canada Lumberman and Woodworker.

These little 10 Horse Power machines will load any log up to a ton and a quarter in weight.

They will load logs at the rate of one thousand or more a day.

They weigh only about 1500 lbs. without the Gasoline Engine, so are easily moved about.

Their cost is trifling, compared with the saving they effect in man and horse power.

They very quickly pay for themselves by reason of reduced operating costs and greater speed and efficiency.

We make these machines in seven sizes, of which the 10 H.P. size is the smallest.

The larger sizes will load heavier logs, and more in a day.

Transmit 100% of Your Power

Why pay good money to generate power and then employ a poor belt that will only transmit a fraction of that power.

If you equip your mill with Goodhue Belts you can transmit 100% of the power generated.

Goodhue Belts stretch 15% to 25% less than other belts and have just the right amount of "cling" on the pulley.

Sturtevant Supremacy

For upwards of sixty years the name Sturtevant has been pre-eminent among makers of air-moving apparatus. More Sturtevant apparatus is now in use than all other makes combined. Isn't that fact significant? All Sturtevant products are built to an ideal based on—

Quality—Efficiency—Economy

ANNOUNCING A

NEW DRY KILN

WHICH
PREVENTS

Casehardening

Checking

Splitting

Honeycombing

Minimizes Spoilage! Saves Time!

With practically no spoilage—the new Sturtevant kiln dries wood in a few weeks where old, crude, inefficient methods consumed months and even years.

Rugged construction insures reliable, continuous service. Compartment type design permits easy and frequent tests and individual treatments. Temperature and humidity automatically controlled. Circulation of air positive. Built to your specifications. Without obligation—our engineering and kiln experts will advise you.

A dry powder is most convenient Use Klim

Klim has proved a wonderful convenience and economy in homes, hotels, lumber camps, boarding houses, and on ships—in fact everywhere that milk is used regularly. This powdered separated milk is especially valuable in lumber camps where large quantities are needed and shipping and storage are factors to be considered.

It is no problem to get Klim into camp. Ship it by freight as you would any other imperishable food.

Klim will arrive as fresh and sweet as when it left our plants in the country and will remain so until the last fine particle is used.

In camp, Klim is your cook's own milk supply. He regulates it to his daily needs, restoring to liquid form the exact quantity of Klim required. It is so easy for him to dip a cupful from the tin and whip it into a quart of water. Thus he has "under his thumb" a constant, unfailing supply of purest separated milk; never so much that part is left over to spoil, never so little as to occasion a shortage. He is not annoyed with sour or frozen milk, he is able to eliminate all waste, and he gets the genuine flavor into his cooking. Your men will be enthusiastic over the varied menu and delicious foods Klim makes possible.

If you appreciate the part good food plays in getting full value from your payroll, you will not hesitate to order at least one case of Klim, Hotel size (equal to 240 quarts) from your wholesale grocer.

LINK-BELT SAW MILL CHAIN

BY REASON of the long continued maintenance of such high standards of excellence, insured by rigid tests and careful inspection given to every foot of Link-Belt, by a skilled chainmaking organization; and our large available stocks; we have developed our line of saw mill chains to a high standard of quality. We solicit your business on the basis of quality and service.

Look for this trade mark on each link. It identifies the genuine Link-Belt—every link of which is guaranteed.

Write for our Saw Mill Link-Belt Catalogue No. 260.

IT'S AGREED that
"ASBESTOL" Gloves and Mittens
Are Best for Lumbermen

They can always be counted upon to give good service.
"ASBESTOL" resists snow, water or heat.

Look for the "ASBESTOL" trade mark. It is your guarantee of absolute satisfaction.

"The
Original
Red
Belt"

"The
Long-Grain
Friction
Belt"

¶ Dunlop "Gibraltar RedSpecial" is the proven benefactor of many an industry in this country which has felt the need of offsetting rising costs by speeding up production and by the elimination of belt trouble.

* * *

¶ "Gibraltar RedSpecial" is a real rubber belt. It may be compared to other brands of belts only as a powerful magnifying glass might be compared with the object whose imperfections it brings into the limelight.

* * *

¶ The first belts of this brand sold have been in use for years and have proven that scientific research—combined with approximately one quarter of a century's experience in the rubber goods manufacturing industry—could offer no more in belt merits than those features for which this Dunlop Product is so well and favorably known.

* * *

¶ We believe Dunlop "Gibraltar RedSpecial" cannot be made better. It is a red, frictioned-surface belt, constructed of the highest grade rubber, and specially-woven duck of tremendous tensile strength. This accounts for its great tenacity, its enduring flexibility and its absolute uniformity throughout.

* * *

¶ Provision has been made in "Gibraltar RedSpecial" against drying out and rotting. The richness of the rubber—compounded to retain its pliability indefinitely—waterproofs the duck as well as holds the plies securely together. It also serves to minimize internal chafing due to the constant bending of the belt. All unnecessary stretch is taken out in the manufacturing process.

* * *

¶ You will find Dunlop "Gibraltar RedSpecial" Frictioned-Surface Belting doing daily duty the year round in Pulp and Paper Mills, Iron Foundries, Steel and Rolling Mills, Saw and Lumber Mills, Mines, etc., in a truly efficient manner.

* * *

¶ We also specialize on Conveyor and Elevator Belts to meet every need.

The Dunlop Unreserved Guarantee

If you have a difficult drive anywhere in your factory drop a line to our Head Office, or to our nearest branch, and we will send a man experienced in belt engineering to consider your requirements. If it is an instance where "Gibraltar RedSpecial" Belting may be suitably employed we will recommend its use; and we will stand behind our recommendation with the fullest guarantee ever issued by a firm producing rubber products.

Another
reason
Why
HUTHER

DADO HEADS
are better

This is an age when any device tending to simplify manufacturing and reduce the number of operations required to do a given piece of work is a boon to all mankind.

Huther Brothers Dado Heads by their ability to simplify intricate cutting and grooving are bringing down the cost of many manufacturers' products.

Their simple, no-screw adjustment, and the fact that they will fit any saw mandrel or rig makes them adaptable to any equipment.

Send for one on approval. Return it at our expense if unsatisfactory.

BOLINDER'S

HEAVY CRUDE OIL ENGINES

Built by a Firm Who Stands Supreme in the Whole World as Oil Engine Experts

In Sizes of
10-160 B.H.P. 2 cyl.
240-500 " 4 cyl.

The Bolinder is the most economical and efficient propulsive power for

Tow Boats and Barges

It operates at a cost of only $\frac{1}{2}$ cent per Brake horse power per hour—an enormous saving as compared with steam. It dispenses with firemen—thus reducing the wage and food bills.

SIMPLE, DEPENDABLE, DURABLE

The Bolinder is extensively used in the British Navy. Some 300 Bolinders were ordered during the War by the Admiralty, some of them for Monitors patrolling the Flanders Coast—a remarkable tribute to the high qualities of the engine.

Over 13,500 Bolinder Engines equal to 650,000 B.H.P., are in successful service in all parts of the World. In Canada and the United States, the Bolinder propels vessels aggregating 175,000 tons D.W.

"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9 ft. wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. BRAZEL PLOWS cut 6 in. wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road, leaving a clean roadbed. Roll and push entirely away from the road, 12 inches of loose snow each time the plow passes over.

Good Will

—a mighty valuable asset to your business and something that cannot be built up in a few days. It is the result of painstaking efforts to give the customer just a little more than he expects—keeping the quality of your products standard—and backing up every word of your advertisements. In short, it's Service — Real Service — that builds Good Will.

How They do it in Wisconsin

As installed in plant of
Rogers-Ruger Lumber Co.,
Superior, Wisconsin

The Yates No. 177 Double Surfacers

is used extensively by Wisconsin manufacturers in making many well-known wood products, as it is in many of the leading establishments throughout the world.

The reason for its popularity is that the No. 177 always makes good.

This machine is sturdily constructed for long service and will handle stock from capacity down to a fraction of an inch in thickness with economy and dispatch. Equipped with round heads and Yates improved grinding and jointing devices, the No. 177 will give fine finish at the fastest rates of feed.

Our free, illustrated circular gives detailed information regarding its many features. This will be sent to you on request.

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

Dunbar Engine & Foundry Co.

WOODSTOCK, N.B.

ONTARIO

Canada's Banner Province

Ontario's timber production last year valued at \$26,774,937 or 40% of Canada's total output.

Pine production, 905,442,000 ft. B.M.

Pulpwood, 246,282 cords.

Railway Ties, 5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.

Inexpensive and Effective Tractive Power

BELL Oil Burning -- Geared -- LOCOMOTIVES

The low cost of fuel, operation, and general maintenance of the Bell Locomotive makes it an ideal engine for the haulage of heavy loads of lumber and timber. It yields 50 per cent. greater tractive effort than direct connected type of locomotive of equal weight. Requires only one man to operate it—having one valve fire control. Burns kerosene, fuel oil, distillate, or crude oils. Eliminates the fire risk.

The Bell Locomotive is very simple of construction, and being of standardized design, the parts are interchangeable, and can be obtained from stock for immediate delivery.

Consider the value and utility of the Bell Locomotive as applied to your business.

Bell Locomotive weighing 12 tons hauls 240 ton logging train at plant of W. C. Edwards Co., Rockland, Ontario, Canada.

IMPROVING YOUR PRODUCT

The engineering experience of 35 years' has made it possible for the Proctor Organization to build dryers for every individual drying need. The usual results are an improved product and improved working conditions. That's why users of Proctor Dryers are always ready to recommend and demonstrate their dryers.

Proctor DRYERS for VENEERS

give a perfectly flat and pliable product without checks or splits

Made by the oldest and largest builders of dryers.
Ask for Proctor Dryer Catalog for your materials.

For the Small Tract of Timber Put in a Portable Saw Mill

For working up isolated tracts of timber many large lumber firms are making good, effective, and profitable use of Portable Saw Mills. Long's Portable Saw Mill machinery features many improvements for the rapid, economical, and efficient output of lumber on the small tract, and we have received many expressions of approval on the accomplishment of this machinery.

Long's Portable Saw Mills are built according to the best principles of workmanship for durability, and reliable service. Send for our catalogue, illustrating Portable Saw Mills.

GET ACTION— IN YOUR LOG DECK

THE modern tendency in sawmilling is to make every second count. We have speeded up the Waterous Log Deck to keep pace with this idea.

To do it we have re-designed and re-built practically every machine in our Log Deck. More particularly, we have discarded the old cylinder with its leaky outside steampipes and have replaced it by a cylinder and lever connections that answer the sawyer's movements instantaneously.

The 1919 Waterous Loaders, Kickers, Niggers, etc., not only work with a "Punch" behind them but there is a snap and action in the work that makes the seconds count. It doesn't take two or three strokes of the Nigger to get the log in position for the cut. The log is placed on the Carriage without hesitation—and placed there RIGHT.

The new cylinder is shown in the attached cut. Steam parts are cast solid; valve gearing and valves are of strong design; a check valve regulates the exhaust to steam cushion the piston at both ends of the stroke. The valve operates by one lever, quickly, easily and on a short travel. Exhaust throttling plugs increase or diminish operating speed of the cylinder without affecting the power of the machine—this is a special feature. All wear on the rod, gland and packing is overcome by the guide bar support for the piston rod.

The cylinder is easily millwrighted, accessible, strong and convenient, and built in diameters of 8", 10" and 12" is supplied on every machine of the *Waterous Log Deck*.

Go over your Log Deck when the mill is running—do *you* make the seconds count.

More information on this topic in our Log Deck Bulletin No. 106

Workmanship

Good workmanship is easily promised. Not so easily given. It has been a 35-year old tradition with us. We started that way. Have stayed that way. Of course, we back ourselves up with the most modern equipment. Boilers, Tanks, Stacks, Burners, etc., from here are right.

HOCKEN LUMBER

*The Quality of Our Product
is Our Best Advertisement*

*We Solicit Your Enquiries
for Lumber in Any Quantities*

"What you get for what you pay" in buying lumber was never more important than it is today. Make your slacking dollar do its full duty in buying reliable quality only.

Hocken Lumber Company's limits in the famous La Cloche hills produce medium size, tight knotted, close grained White and Red Pine trees—straight, smooth and unblemished. Nature made them, and our up-to-the minute mill is turning them into lumber so nearly perfect that we are proud to recommend it to the trade. It is our mark of accomplishment. It is the consumer's mark of assurance.

Andrew Carnegie

One of the most forceful personalities the world has ever known had this for one of his four business rules:-

Subject all products to more rigid inspection than the purchaser requires. A reputation for producing the best is a sure foundation upon which to build.

We have built our reputation upon the foundation of quality, careful inspection and service.

Do not get too low on any sizes as mill stocks are getting low.

Our Idea of Service

EXCESSIVE rains have retarded hardwood production. We are frank to admit that our stocks are broken from supplying the constantly growing demand of our customers. However, we are producing a fair volume of Ash, Elm, Hickory, Maple, Oak and Poplar with the aim of giving even better service, if possible. And, as always, our customers must be satisfied. If it happens that we can't help you in the above lines we may be able to refer you to someone who can. Ask us.

Attention! Attention!

Have you studied the conditions of the supply and demand of all commodities? Have you read opinions of well read men? If so, you will know that the peak of high prices has not been reached, in all commodities and that the opinion of the best posted is, that they will not be reached until the spring or summer.

Lumber, especially, will go a deal higher, on account of labor trouble, heavy rains in the south, and other conditions, and also on account of the heavy consumption which will be increased materially in the spring. Look at the prices on Hardwoods and see how they are advancing every day.

CYPRESS is the best value to-day, and when you look for this wood—look for Service. We can give it to you. With up to two million feet of CYPRESS in our Cairo yard, and large stocks in the south, we can make prompt shipment. Buy now. Write us for prices.

GLOVES & MITTS

Well Known in the Lumber Camps

There must be more than ordinary quality in a work-glove to stand the lumber-camp test. The lumberman does not handle things gently—he works. And he wants a glove that will work with him. He has found such a glove in the TAPATCO Brand—and he likes it so well that thousands of these gloves go into the woods every year to help bring in the logs.

The styles the lumbermen like best are our heavy weight Canton Glove and the leather-faced glove which we make for heavy service.

"TAPATCO" COLLAR PADS

Keep the Horses Fit

A Pad so well made that it gives long service—with hooks so secure that they do not work loose. Use these pads to protect the necks of your horses. They prevent friction and so remove all possibility of sores, galls, and chafing.

The Ideal Edger for Light Mills

Specifications

Our new Double Edger is built on entirely new lines, and possesses many features that commend it to mill men. The saving in material alone will soon pay for the machine. The output of a mill with this machine can be increased by one-third. It is best adapted for medium-sized or portable mills that cut from 5,000 to 25,000 feet of lumber per day.

SAWS—This Edger is fitted with either two or three saws as required. The saws are 16 in. in diameter, and 10 in. gauge. The greatest distance between saws is:—Two saw machines, 24 in.; three saw machine, 20 in., the least distance between saws, 2 in.

DRIVE PULLEY—The Drive Pulley is 9 in. x 9 in., affording a good belt grip, and is supported by an outside bearing.

SAW ARBOR—The Saw Arbor is made of 2½ in. steel, and has very wide bearings.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice, at Buffalo, N. Y., under the Act of Congress of March 3rd, 1879.

Expanding Factors in Lumber Trade

This is the age of expansion. Progress is evidenced all along the line. A fair index of the trend of the times is the number of new companies which are being incorporated. Each week sees many industrial and commercial organizations which have been granted charters. These newly-formed concerns represent every line of business, and more particularly lumber, pulp and paper.

In the lumber arena there is a feeling of optimism and confidence prevailing, not only with respect to the future demand, but regarding the stability of conditions in general. It will be a question next year of where the requisite stocks can be obtained. There is already a dearth of supplies in many kinds of wood. Should building activity keep up in 1920—and there is no reason why it should not—there is likely to be a decided shortage of material, and those who have postponed structural operations this season in the hope that 1920 would usher in larger supplies and lower prices, may find themselves sadly astray in their calculations and predictions.

The lumber business is growing wider in its activities and its exponents have become more numerous. Within the last three months there have been probably two score companies incorporated and fully a score of new wholesale firms have been established in Toronto, Montreal and other cities to embark in the handling of forest products. During the war there were comparatively few new lumber syndicates organized and several wholesale firms went out of business owing to the stringency of conditions and the gradual shifting of the demand from the ordinary channels of distribution to meet the unusual demands created. The whole complexion of things was changed, but now the pendulum has swung in the other direction and a large percentage of lumber, which formerly went in-

to shipbuilding, aeroplanes, shell boxes, gun carriages, gun stocks, cantonments, saddle trees, cots, etc., has reverted to the usual lines.

So far as manufacture and distribution are concerned, everything is now back to where it was, but the question, bound to loom large in the near future, is where can sufficient lumber be obtained? Stocks are low, production will not increase a great deal, and the demand has, for many weeks, been most insistent and widespread. It requires little or no selling ability to dispose of wood goods to-day, but it does require a careful study of the situation, a thorough knowledge of conditions and not a little foresight and perception to secure the lines that are in urgent requisition. Much will depend upon the attitude of labor during the next few weeks, the character of the winter and the cost of supplies, etc., as to whether the volume of woods operations of 1919-20 will exceed in the aggregate that of 1918-19.

* * *

Another Evidence of National Stability

The recent success of the Victory Loan portrayed the faith and confidence which the Canadian people as a whole have in the solidity of the Dominion and its future welfare. The splendid response which attended the floating of the bonds is an object lesson of the optimism and assurance with which Canadians view their country's weal. They have demonstrated that they are self-reliant, far sighted, enthusiastic and aggressive. It is these qualities in a people or a firm which make for stability and permanence, progress and expansion.

Canada played a heroic part during the war. She never fell down on the job, and in a similar sense she is making good with her industrial problems and the rehabilitation of conditions displaced during the five years of the European conflict, in which the whole current of events was changed. Now the old problems have to be taken up again, and many new ones as well, and it is interesting to record the prophetic words of Sir Henry Drayton, the new Finance Minister of Canada, who proclaimed that the success of the recent loan was the final making of Canada's pledges—the final chapter in the war efforts. He stated that our dollars are going to be doubled and the world's markets were at our doors. To-day is Canada's, and we can make to-morrow Canada's, too.

The fact that practically every centre in the Dominion exceeded its objective, and that so many firms won the Prince of Wales flag shows that, individually and collectively, much can be accomplished if a high standard is set and every effort bent in the direction of its achievement. For anyone to have stated five years ago that it would be possible to raise a popular loan in Canada of nearly seven hundred million dollars would be tantamount to the observer inviting an investigation of the workings of his mental machinery, but great things are being done and there will be greater things yet accomplished.

The credit of the country has been preserved, her enterprises will be fostered, her foreign trade extended, her processes in military re-establishment adjusted and her export outlets afforded every facility. The last chapter of Canada's war effort has been in keeping with her marvellous war record.

Much that was accomplished was done through the energy, activity and devotion of a number of self-sacrificing and public spirited business men who did all in their power to see that the success of the loan was assured. It is gratifying that their efforts were so richly rewarded, not from dollars and cents standpoint, but in the carrying out of a duty well and nobly done. There is no doubt that these men put forth greater endeavors on behalf of their country than they usually do in their own private business, and the people generously responded. The support came from all classes and was one united, whole-hearted, aggressive effort, showing that even with the absence of a patriotic appeal or war urge, really big things can be realized. The press also played its part and the whole principle underlying the loan was "Canada First."

Apart altogether from financial considerations, the sixth Victory Loan was a splendid advertisement for the country, revealing the financial strength of the Dominion, the energy of her people, the spirit

of the times and confidence in the future. With such a sentiment manifesting itself on every side and with a co-operative, good-natured effort there is little to fear regarding the days to come.

It has been pointed out that the spirit exhibited during the recent campaign should continue to manifest itself by subscribers holding their bonds. In doing this they will help greatly to advance the value of the security, with the resultant benefit to the subscriber and to still further confirm the credit of Canada.

With work and thrift, greater production and the practice of economy, there is no doubt that the Dominion will weather any post-war storm and sail triumphantly into the port of prosperity, efficiency and expansion.

The Ebb and Flow of the Lumberjack

Everywhere there is restlessness in the ranks of the ordinary lumberjack, especially the foreigner. He seems imbued with a spirit of moving here and moving there and getting nowhere. How to correct this tendency to travel and to make these men remain in camps after their transportation has been paid to the destination, is one of the big problems that lumbermen have to face. The constant shifting is getting to be a matter so serious as to call for legislative or other restrictive action. The camps are comfortable, the food substantial and varied, and wages the highest ever known for this class of work, yet the practice of "jumping" is as pronounced as ever.

The country is crying out for more lumber and larger production. Operators are willing to open up more camps. They have the virgin material, but if they cannot get someone to fell the standing timber the quantities available are of no use for constructional or manufacturing purposes. Increased output simply resolves itself into getting the men, and in some centres help is reported as being decidedly scarce. But everywhere there is one general grievance, and that is, the elusiveness of certain types of woodsmen which seriously impedes operations, disarranges internal administration and general efficiency in the camps.

The situation now and then has its amusing side. One lumber company applied recently to an immigration centre for assistants in the bush. Back came the reply:—"We have no one that we can recommend. All around here now are either thieves or thugs." One manufacturer, whose mills are still busy, inserted advertisements in the country newspapers to the effect that he required men for the woods and was willing to give them \$70 a month, with board and transportation, and if they remain three months, to pay their fare back home. This has resulted in calling forth a representative class of young farmers who are expert at handling a team, and, while they may not know all about bush work, still they readily learn. They are content to receive this liberal wage and come out in the spring with several hundred dollars to their credit, eager to assume the work on the farm again. This plan is eliminating the foreigner and resulting in greater efficiency and augmented production.

* * *

Use of Tractors in Woods Operations

The purchase of six tractors for log hauling by the Wayagamack Pulp & Paper Company and Laurentide Limited, reported in our last issue, is worthy of comment, as evidence of the tendency to adopt mechanical devices in woods operations. In Quebec, at any rate, the use of tractors is rare, the River Ouelle Pulp & Lumber Company being one conspicuous instance where these machines have been successfully tried. Mr. W. G. Power, of that company, at a meeting of the Woodlands section of the Pulp & Paper Association, in January last year, gave some details of the operation by his company, emphasizing the point that the tractors must be properly handled if good results are to be secured. In other words, lumber and pulp companies must be prepared to make the necessary capital outlay—not to cut down here and there with a view to saving expense. That way lies failure. To secure the full benefits of tractors, arrangements must be made to ensure continuous operation during the season; a breakdown might entail the holding up of the entire hauling.

The Laurentide and Wayagamack Companies apparently intend to thoroughly test out these machines, particularly in connection with

pulpwood. These efforts will be following up the recommendation of the Woodlands Section Committee on Logging Improvements, which suggested that by the use of small tractors, hauling say five or six cords to a load, the work can be materially cheapened. Such machines do not need very much work done on the roads and can manoeuvre easily in the woods. By having two sets of sleighs for each tractor, they can be kept running steadily. In their use it pays to have a skilled mechanic to keep them always in good order. An extra machine, or a good supply of repair parts, should always be on hand. As the cost of the machines is low, this is quite feasible.

On the Pacific Coast the use of tractors is more general. At the last convention of the Pacific Coast Logging Association four papers on this subject were read, three of them dealing with Western problems. The tractors used are of the caterpillar type, and the writers of the papers expressed the opinion that the machines are economical and efficient. In one instance the total cost was figured at \$4.25 per thousand logs, and in another at \$30 per day per unit, this allowing for two men, and also for the cost of depreciation. Up to 30,000 feet are moved per day per caterpillar machine by one company, while another company's average is 36,000 feet per day, on a three round trip schedule.

The increased cost of manual labor, combined with the decrease in the productive capacity of the men, has naturally directed attention to the employment of more mechanical devices for logging operations, not only with the view to decreasing costs, but also with the object of putting the companies in a position where they will not be subject to the vagaries of many of their employees. It was stated at one conference of the Woodlands Section that in woods operations very little improvement, from the mechanical side, has been made in recent years, although from the mill end there has been great progress. While tractors, of course, will not suit every condition, there is evidently, in the opinion of the officials of the Laurentide and Wayagamack Companies, a sphere of usefulness for them in that particular branch of the lumber business with which they are identified.

Editorial Short Lengths

Efficiency and greater production, thrift and economy are the characteristics, both national and individual, which will re-establish Canadian industry on a sound peace footing.

* * *

A leading business man said the other day there was nothing more discouraging than a competitor financially embarrassed—no, nothing, except being financially embarrassed yourself.

* * *

Gentlemen, the demands that some of the radicals are making cannot be satisfied with increased wages, for they demand nothing less than turning industry over to them. There is no justification for that kind of partnership, for the only kind that is successful in business is that which is earned and paid for.—Chas. Piez, President of Link-Belt Co.

* * *

The Associated Boards of Trade, at a recent convention in Toronto carried a resolution in favor of daylight saving by a majority of one. Strange what an important figure this is getting to be. The new coalition government in Ontario had a majority of one, and the average individual in these days of stress and strain and the high cost of living has to look out for Number one if he wants to keep from the reach of the bailiff and the sheriff.

* * *

President Beatty, of the Canadian Pacific Railway, intimated in an address before the Canadian Club of Toronto that another increase in freight and passenger rates was not one of the improbable happenings of the future. There is really nothing startlingly new in this announcement, as the frequency of advances is almost as common a subject of conversation in transportation circles as the weather, the political situation and the success of the U. F. O. movement.

* * *

From the reports received throughout the Sudbury district a large number of new sawmills are being erected and woods opera-

tions, particularly, will be carried on more extensively than ever before, especially with regard to the taking out of ties and pulpwood, of which the call has been unusually active during the past few months. The prospects for an increased demand in these lines are exceptionally strong, and there is no doubt all that can be produced will find a ready market.

* * *

It has been said "The East is East and the West is West, never the twain shall meet." A despatch from the prairie provinces states that owing to the scarcity of coal some of the rural residents are burning up lumber, which costs \$40 to \$50 per thousand, and in the East there is reported to be a decided shortage of lumber, with the call in many lines unusually insistent and only diminishing stocks in sight. Two great contrasts are thus brought out,—in the East greatly depleted stocks of lumber, while in the West there is lumber to burn.

* * *

The head of a leading industrial organization, the name of which is known all over the American continent, stated in a recent address before the Associated Business Papers Congress that he had always believed in technical and trade papers and that they had exercised and are still exerting a powerful and beneficial influence in advancing the status and progress of industry. He was of the opinion that they had a large mission still ahead of them and a mission that would call for every bit of energy and intelligence that the publishers and editors were capable of bringing into play.

* * *

It used to be an uneventful week in Canada when a new breakfast cereal was not placed on the market. This gave rise to a jocular saying that even sawdust was being dished up for the delectation of appetites at the morning meal. The next development was in the line of gramophones, and scarcely a week passed without some new brand being placed before the public, and all proclaimed the latest achievement in beauty, art and tone. Now another epoch has arrived, and it is a quiet week when no new organization is announced in the pulp and paper line or some extension to the output of the present large companies. The activity in pulp and paper stocks has of late been particularly marked, and the securities have been eagerly seized upon whenever offered to the public.

* * *

The Imperial Department of Overseas Trade in London is organizing an exhibition of timbers grown within the British Empire, to take place from July 5th to 17th, 1920. It is proposed that the exhibition should include: (a) Specimens of timber (polished and unpolished); (b) Timbers used as flooring, panelling, etc., furniture, ply wood and woodenware generally; (c) Wood pulp. The principal object of the exhibition is to bring prominently before users of timbers the full range of those grown within the British Empire, and to demonstrate the chief uses to which they may be put. Canada will be represented by a large variety of lumber. On this side the arrangements are in the hands of Mr. Stokes, of the Forest Products Laboratories, University Street, Montreal, who is still collecting specimens and data.

* * *

Says a leading Canadian manufacturing firm in a line closely allied to the lumber business:—It is seemingly useless to agitate for lower prices until the world's starved condition is remedied and the productive capacity of the world catches up with the needs of the consumer. This can never be as long as the present labor unrest exists and the only satisfactory solution of the problem appears to lie in industrial peace and increased production. We urge our customers and friends to eliminate all possible wasteful methods, purchasing only such goods as will take care of their present needs and those of the immediate future. By all assisting in this, more rapid recovery to a sensible level of trade conditions can be made and the present spasmodic, chaotic and disproportionate conditions will give way to a conservative and sound basis of doing business.

* * *

The Federal Government recently advertised for a superintendent of the Forest Products Laboratories, Montreal, to succeed Dr. Bates. The applicants were required to have high technical quali-

cations and business abilities, but unfortunately the salary offered was not commensurate with the necessary qualifications. The result was as might have been expected. The salary was not sufficient to attract men of the high standard required, and the Government is now about to offer an appreciable increase in the remuneration. The Government has not been generous in its support of an institution which has done good work for the country. The consequence is dissatisfaction, and the gradual loss of officials to pulp and paper companies, who are prepared to pay for the qualifications possessed by men who have made a study of important problems connected with the lumber and pulp and paper industries. Indications point to a very large expansion of these industries, particularly in the province of Quebec, and the Government cannot expect to retain members of the staff when companies are willing to offer them salaries substantially higher than those paid by the federal administration.

* * *

The sawmills of Canada are gradually disappearing through the clearing up of limits in the various sections, and rarely is there an operating location where more timber exists than will supply the requirements for a comparatively few years. It is a sad story to publish in nearly every edition of the "Canada Lumberman" the destruction of several plants by fire. In spite of the utmost precautions, the best fire-fighting appliances, stand-pipe installations, water mains, sprinkling systems and other usually effective safeguards, there is no appreciable diminution in the number of mills wiped out by the devouring element. This is all the more regrettable at this particular period of industrial expansion and greater production. The output of every mill in Canada running at full capacity can be sold at profitable prices for many months to come. The situation grows serious, and anything that can be done to stamp out the ravages of the fiend not only in the timber areas of each province, but also in lumbering towns, should receive strong encouragement and support. No matter how heavy an insurance is carried there is bound to be a decided loss to the sufferer, owing to the fact that no building of any kind can be replaced to-day within fifty per cent. to one hundred per cent. over and above what it would cost three or four years ago.

* * *

"I notice that a number of American firms buying Canadian lumber are insisting in their agreements that they be paid on the basis of American funds, the exchange running against Canada to the extent of about four per cent. just now. I hope, when the balance of trade has readjusted itself—as it will some time in the future—that Canadians will return the compliment. I have known American funds to be at a premium in Canada especially in the fall when the grain shipments are heavy and that state of affairs may roll around again. Then Canadian wholesalers and manufacturers should see that they are paid in par value by their American customers. It is 'a poor rule that will not work both ways' and 'a turn about is fair play' in matters financial," declared a leading wholesale lumber merchant of Toronto recently.

* * *

The Montreal Board of Trade have had under consideration the proposed increase in wharfage charges, and have passed the following resolution—"That while the Board of Trade fully appreciate the necessity that the Harbor Commissioners are under of securing adequate revenue, it, as representing those from whom said revenue is collected, holds that it is entitled to have some voice in the adjustment of the charges that produce it, so that they may be fair to all concerned, and it would, therefore, seem reasonable that the commissioners should agree to discuss the new tariff of wharfage charges with representatives of the board and other organizations interested." The Commissioners will be asked to receive a deputation on the subject.

* * *

The overwhelming prominence of wood in the construction of dwellings in New Zealand is shown by the fact that of the 229,423 private dwellings erected in 1916, 219,000 were of wood, 7,000 of brick, 1,280 of stone and 1,680 of concrete, says the Vice Consul at Auckland in a recent consular report. In many counties, he adds, there is not a single dwelling built of brick or stone.

A Progressive Lumber Manufacturer

Frank Blais Has Built Several Sawmills in Quebec and Directs Many Other Activities

Frank Blais, Amos, Que.

With twelve dollars of borrowed money in his pocket Frank Blais went to Boston some twenty-five years ago to work in a brick yard. To-day he is a prosperous wholesale lumber merchant and manufacturer in the province of Quebec and owns and operates four saw mills, extensive timber limits, a general store and a flourishing pulpwood and hay and grain business. His life story is one of push, purpose and achievement. He is a progressive French-Canadian citizen, of whom the province of Quebec has many, not only in the lumber business but in other lines of achievement. Mr. Blais' first job was, as stated, in a brick yard in Boston. He then drifted into bush work and went to New York state to cut logs and get a practical acquaintance with woods

operations. His next move was into the state of Connecticut where he secured a position with a man named C. B. Terrell, who was a lumberman and contractor. Mr. Blais stayed with him for seven years doing all kinds of work from cutting poles to running portable sawmills. Seventeen years ago he returned to Canada and opened a general store at St. Thecle, Que. This village is located in Champlain county, on the Canadian Government Railways. About this time he began to buy pulpwood for the Riordon Pulp and Paper Co., of Montreal, and still continues this work, along with his many other activities. In 1904 he built two sawmills, one at St. Thecle and the other at Hervey Junction, and for several years supplied railway contractors with all their requirements in forest products and also feed for their horses. He furnished about 400 cars of hay and 25

Mr. Blais' boat conveying logs to the mill at Amos, Que.

cars of oats annually until construction on the railway was completed and the business in this line ran about \$200,000 a year.

In 1912 Mr. Blais built another sawmill at Doheny station, 25 miles east of LaTuque on the Transcontinental railway to Quebec, which has a cutting capacity of 40,000 feet a day. He has there 20,000 acres of patented land covered with a splendid growth of red birch and spruce. Two years later he erected a fourth sawmill at Amos of equal capacity to the one at Doheny and has since purchased sixty square miles of timberland consisting principally of spruce. There is about a million feet of pine on the land, the remainder being black spruce, the stand of this being estimated at 30,000,000 feet.

The subject of this reference conducts a planing mill and a shop for mill repairs. He also manufactures shingles and, in his planing mill, during the past summer, dressed three quarters of a million feet of lumber. He also owns a large general store for supplying the many workpeople that he employs with the necessities of food and raiment.

All logs are hauled by an alligator, a steam boat and two gasoline launches and are driven by booms to the various mills. His out-

put of spruce, pine and birch is marketed chiefly in New York state, since the work on the Canadian Government Railways was completed. The accompanying view shows one of Mr. Blais' boats drawing logs. Mr. Blais is a busy man conducting all these operations alone but he has a large number of competent employees, who have co-operated with him in building up his business to its present gratifying proportions.

Northern Spruce Mills Sold Up To Saw

Frank W. Gordon of Terry & Gordon, Toronto, who visited all the producing centres in the Sunset Province during October and November, returned home recently and gives some interesting information regarding lumbering and logging conditions in B. C.

Stocks at all Northern British Columbia Spruce Mills are sold right up to the saw, all of this moving readily to New York and other Eastern American points. The larger mills in this district are closed down for the winter, the smaller ones continuing to operate into the winter, as far as possible. The majority of plants in the Southern interior of the province were closed down at least a month earlier than usual, owing to a log shortage. This combined with an unprecedented demand for all classes of lumber has reduced stocks to a point where the situation becomes serious, particularly to the consumers of the Western provinces. However, a kernel of reassurance may be extracted from the programme for next year's production by the Mountain millmen who are exercising their resources unsparingly to make production sufficient to take care of a widening demand. New operations will tend to increase the production of Western soft pine and spruce. Coast loggers and millmen are struggling valiantly to cope with prevailing conditions. A serious situation is developing in the shortage of logs, with possibilities of Coast logging camps closing down until spring, which leaves no alternative for ninety per cent. of the tidewater mills but to discontinue operations until logs are available. While prices embracing all B. C. lumber seem high and appear to the lay mind to be a lucrative proposition for the lumbermen, Mr. Gordon is of the opinion that the majority of mills throughout B. C. have not been able to pay usual interest rates on their capital investment. Production costs were always in advance of raises in selling prices. Coast fir logs cost the millmen on an average of \$18.00 per M. Manufacturing costs are not less than \$10.00 per M., and the present selling price on fir timbers is less than \$26.00 F.O.B. cars B. C. mill points.

As is usual at this time of year, requisitions from the natural markets are not at all brisk, except for clears and factory stock of all kinds. There is an insistent demand from Western and Eastern Canadian provinces for clear and factory cedar, pine and fir, which must remain unsatisfied until next year's cut comes to the market. At present it looks as if the American buyer will continue to take upwards of 75 per cent. of B. C.'s production for next year. There is a strong movement among the large distributors in Seattle, Minneapolis, Chicago and other American centres to get protection in prices and secure as much stock for next year as possible.

British Columbia mill men, however, are loathe to assume any obligations for next year's production. Any stock which they are offering now is for immediate movement only.

Prices On Southern Woods Keep Soaring

W. H. Harris, of the Frank H. Harris Lumber Co., Toronto, returned recently from spending six weeks in the South on a purchasing trip to cover the requirements of the firm for the next few weeks. He bought large quantities of yellow pine, cypress, red and sap gum and quarter-cut oak. The company operate two mills at High Point, Miss. Mr. Harris reports that the recent oil boom in Texas and Oklahoma is causing a pressing demand for yellow pine, both dimension and timbers, all the way from 4 x 4 up to 16 x 16 inches of varying lengths. These are used for the erection of derricks and there has been a recent advance from \$2.00 to \$4.00. The rains in the South have been heavy and continuous, interfering seriously with logging operations, and the help problem is growing more acute all the time with the demand for higher wages and shorter hours.

Mr. Harris visited all parts of Alabama, Tennessee, Mississippi and Louisiana, and says that the feeling throughout these states is an optimistic one in regard to the future demand and prices of lumber. All hardwoods have recently advanced from \$10 to \$20 per M. owing to the increased cost of production, and yellow pine, which underwent a decline at the time the \$10 a day demurrage was placed on cars in transit, has now passed over and quotations are back to practically where they were some weeks ago, with the number of requisitions increasing all the while.

The Frank H. Harris Lumber Co. report that there is a good demand in Canada for yellow pine, interior finish and trim and also for southern hardwoods, and shipments, considering the congested car situation in some districts, are coming through satisfactorily.

Lumbermen Discuss Freight Rate Problem

Many Instances of Inequalities Pointed Out—Shippers Always Seem to be on the Defensive and Never on the Aggressive—Group Ratings

The Wholesale Lumber Dealers' Association held their monthly meeting on November 21st at the Albany Club, Toronto. Mr. A. E. Clark occupied the chair, and there was a very representative attendance.

The first matter of business, after the members had dined, was a report presented by the chairman relating to the recent Navy League campaign. A team representing the wholesale lumbermen of Toronto had been appointed by the chairman, as a result of a decision reached at the October meeting, and the report of the work done by the team showed that it had made the best record of any of the various teams engaged in the campaign. The total collected by the lumbermen, exclusive of "specials," was \$9,453.25, while the next highest team total was \$5,329.75. The lumbermen's team, moreover, collected three times as much as any other team working in a similar section of the city. The chairman read a most appreciative letter of thanks from the Navy League for the work the lumbermen had done. Considering the fact that this was the first time that the lumbermen had worked in a campaign of this kind and that they were opposed by some teams which had had considerable experience in work of this nature, their record was a fine one.

Some Work for Transportation Committee

Railway freight rates were the subject of a long discussion introduced as the result of a reference to the subject by the Fesserton Timber Company. In southwestern Ontario, the Fesserton Timber Company frequently met with difficulty arising out of the fact that no freight rates are published to Canadian Northern Railway points in this territory. Frequently a representative of the railway would make a mistake in figuring a rate and the result would be that the freight charges were higher than those upon which the wholesaler had based his quotation. It was suggested by the Fesserton Timber Company that the transportation committee of the association should take this matter up with the Canadian National Railways.

Mr. A. C. Manbert mentioned the inequalities between the rates on lumber from Georgian Bay points into the eastern States, as compared with those from some other Canadian producing points, which resulted in discrimination against the Georgian Bay producers. He also pointed out that the rates from Ontario points to some points in the eastern States were higher than those from points in the United States in Wisconsin and upper Michigan, in spite of the fact that the haul from the latter point was longer. In the past it had been difficult to get the railway companies to take these matters into consideration, as railway conditions had not been favorable. Now that the roads in the United States were to be returned to their original owners, however, and some orderly arrangement of these matters seemed to be probable, while at the same time there was a prospect of a national system of railroads being developed in Canada, it seemed that the opportunity might be here to press upon the C. P. R. and upon the Canadian National Railways the necessity for establishing arrangements with the roads in the United States which would give us rates such as we were entitled to have.

The Advantage of Group Rates

Mr. A. E. Eckardt spoke of the grouping privilege whereby railways on the other side were able to get group rates to points in a district, such for instance as "Toronto and West," in Ontario. If the railways here could give the United States railways these grouping privileges, it was only right that the railways on the other side should grant us similar privileges, such as group rates into Pennsylvania, New York, etc. His own experience had been that the shippers were always on the defensive with the railway companies, instead of being aggressive. Everything brought up before the Board of Railway Commissioners seemed to be presented from a railway standpoint, and the shippers were not prepared with the data necessary to oppose them. He referred, for instance, to the matter of minimum weights, and suggested that the Wholesale Lumber Dealers' Association should start a propaganda for the simplification of freight tariffs. He urged that each member should keep on file, in a readily available manner, all information regarding the trouble he was experiencing in connection with minimum weights.

Mr. Eckardt also referred to a standard form for the presentation of overcharge claims, copies of which he had received from the C.P.R. These he exhibited to the members and suggested that they were a

good thing, as claims presented in this manner would be more promptly attended to by the railway.

The Chairman, Mr. A. E. Clark, also pointed out a number of inequalities in rates, and said that the association would do well to memorialize the railways and the government on the subject at once.

Declares Charges are Exorbitant

Mr. J. H. Duthie, of the McDonald Lumber Company, Toronto, who was a guest at the meeting, and who has had extensive experience with the railway companies of the United States and Canada in connection with freight rates, both as a shipper and as an employee of the railways, was asked by the chairman to speak on the subject. He expressed the opinion that it would be possible for the shippers, now that the Canadian Government was taking over the Grand Trunk, to insist on dealing directly with the officials of the government roads, instead of having to deal with the Car Service Bureau. He discussed the question arising out of the appointment of a commission to operate the government railroads and asked whether the government would also be justified in appointing another commission to watch over the operating commission. If the men appointed to the operating commission were competent there would be no use for another commission, such as the Dominion Railway Board, to watch over them.

Mr. Duthie stated that the present freight rates were exorbitantly high. The main thing needed in Canada to-day was restoration of railway competition. If we obtained that we would get a reduction of 25 per cent. in freight rates within six months, notwithstanding the statements recently made by some of the railway company representatives that they would soon need higher rates.

There was only one way to get what they wanted from the railway companies. That was to know exactly what was wanted before appearing before them. Most of the railway company officials were fair-minded men and would give you what was right. Unfortunately, many of the railway men were not acquainted intimately with the requirements of business. If they were, the shippers would be treated very differently. He believed, however that if they were to go before the Canadian National Railways with a well-prepared case, pointing out the desirability for establishing through rates, they would get them. It was a very simple matter for the railway companies to arrange rates, and if they could be shown that existing rates were unfair they would change them.

The discussion resulted in the matter being left in the hands of the transportation committee with the understanding that they would study the subject closely and take such steps as are necessary.

Some Ideals in Public Service

Mr. W. H. Alderson, of Gutta Percha & Rubber Limited, Toronto, who attended the meeting as a guest of the association, was then introduced. Mr. Alderson is second vice-president of the Toronto Board of Trade, and he delivered an address upon public service ideals and upon the work which is being carried out by the Toronto Board of Trade. He outlined a large number of questions which the Public Affairs Committee of the Board had dealt with during the past year and urged the members of the Association to give the Board their heartiest co-operation.

Mr. K. M. Brown, the new representative in Eastern Canada of the Vancouver Lumber Company, Vancouver, B.C., was introduced to the members present and addressed them briefly. Mr. Brown, who made a most favorable impression upon his future confreres, spoke of conditions in the West, laying particular emphasis upon the fact that many of the western mills are operating double shifts and are still unable to keep up with the orders they are receiving.

On motion of Mr. W. E. Bigwood, seconded by Mr. W. J. Lovering, it was decided that a letter should be written by the secretary to the new Minister of Lands and Forests for Ontario, congratulating him upon his appointment to this important department, offering him the co-operation and services of the association and requesting him to be the guest of the Association at its next monthly dinner.

The meeting then adjourned.

R. McDonagh, of Hart & McDonagh, wholesale lumber merchants, Toronto, has now quite recovered from his long and painful attack of rheumatism and is able to attend to his regular duties again.

The Qualities of a Good Lumber Salesman

Red Blooded, Hard Working, Smiling Salesman Radiating Optimism From Every Pore is One of Best Advertisements that Any Firm Can Have

"Several years ago the cypress people saw the necessity of advertising and boosting the sale of their 'wood eternal,' as they are pleased to call it. They spent thousands on top of thousands of dollars advertising in the highest class trade papers and leading magazines of the country," said V. M. Lacey, of St. Louis, Mo., who is President of the Lumber Salesmen's Association, in that city, in a recent address.

"I don't think their salesmen thought so much of their wood until they began to see its praises sung on a page or two of every trade paper they picked up, and in almost every good magazine in the country. Then these salesmen reached the conclusion that they had something to sell of unusual merit, and wherever you meet a cypress salesman you will meet an individual filled with confidence and optimism because he has read everywhere that he is selling a 'wood eternal,' a wood that will last forever.

"All this time we boys who were selling southern pine had an article to sell that filled ten requirements where cypress filled one. We had and have an article that will construct complete everything from a chicken coop to a giant warehouse, but I wonder just how many of use realized what a wonderful wood we had to sell.

"I am strongly of the opinion that boosting and advertising southern pine has had as much to do with our position to-day as any natural cause such as supply and demand. Everywhere we go the slogan "Own Your Own Home" stares us in the face. Everywhere we go we hear the hammer and the saw, and every salesman radiates optimism, and in my opinion boosting and advertising has had as much to do with our present prosperity as anything else. We salesmen are not advertisers in printed form, but every one of us is an advertiser of the lumber we sell, and I am going to say, without equivocation, that a red-blooded, hard-working, smiling salesman radiating optimism from every pore of his skin, is the best advertisement any firm ever had, or ever will have.

"However, we southern pine salesmen have our weak points, and, taking myself as just a fair average, I want to say a few words about our common weakness.

Know Good Points of What You Sell

"I do not believe we know anything near enough about the good points of the wood we are selling, and the Lord knows we, as a class, hardly know anything about the wood our competitors are selling.

"We all know that when an adding machine salesman comes to us with a machine to sell that he can explain every point of that machine, every reason why it is better than the other fellow's machine in the points that he wants to bring out, and you can't ask him a thing about the machine that he cannot answer instantly, and if most of us will be frank and admit it, nearly anybody can ask us questions about the merits or demerits of our southern pine that we cannot answer intelligently.

"I remember quite well a number of years ago of selling a bill for two million feet of crating stock at a certain price. Business was terribly dull and the firm I was with was very hard up for orders. This was a very sharp buyer. I do not mean sharp in the ordinarily accepted term, but I mean he was shrewd and keen, and if a salesman escaped with his pants he was a bird. Well, to make a long story very short, this buyer told me he could not buy southern pine from me because he could buy hardwood at a much cheaper price, so the result was he showed me his price on hardwood, and, like the sucker I was, I took the order, and all the time he was laughing in his sleeve because the southern pine was worth, on account of the easiness of working, saving in freight in the re-shipping, etc., three or four dollars more than the hardwood. Well, I'll admit I was a cub salesman, but a lot of us are cubs sometimes even though we have been in harness all our lives, and get caught up on things we should know. But it is not so much the mistakes that we make that I am driving at. I guess none of you has gotten stung on one so simple as I was hooked on; the thing is, however, that every one of us should endeavor, if he wants to be an expert salesman, to first learn as much as possible about the true merits of his own wood, and, secondly, learn all he possibly can about the wood his competitors are selling. I do not mean that he should try to become an expert in the knowledge of all woods, but we surely should try to learn as much as possible about our principal competing woods.

"I wish to speak just a few words here as to the service we may render our customers.

"It seems to me that during these strenuous days about the best

service we can render is the service of honesty and truthfulness. Our customers are looking to us to do all we can for them in the way of getting stocks for them to do business on, and while we are apparently almost helpless along that line, there are many little things we can do that will help and be appreciated. Some of us, at times, permit ourselves to be persuaded to take orders for something that does not show on the stock sheet, thinking, that we are helping our customers. I think you will agree with me that we are not helping our customer when we do this, but are rather hindering him, so let's be honest and tell him so.

"Another thing we all should do, and I believe most of us already do, and that is, tell our competitors that a customer is in the market for this or that, but that our firm hasn't the stock, and in that way gain the good will of both the customer and some other salesman. I believe in fighting fairly for every thing I can get, but if I haven't the stock why keep the knowledge that my customer wants certain items to myself, when I know that one of my competitors has it? I am afraid we do not get close enough together; we don't meet often enough to discuss conditions that are prevailing. Believe me when I say that when you get a few fellow salesmen boosting you along as an honest, square competitor, willing to give and take honest information, you have added an asset to yourself as a salesman that nothing can take away.

Helping the Customer to Get Lumber

"I knew the time when it just naturally hurt a salesman to see a competitor in a customer's office; I have had salesmen slip out and call my customers up and tell them not to place an order with Lacey until he could see him. That was the custom, almost, although, I now look back and see what a despicable custom it was. I don't think those things are done any more. We have got to keep the trade supplied with our lumber and a mighty good way to do so is to help your customer get our lumber somewhere, if you can't furnish it yourself.

"Another mighty good thing for all of us to do is to keep posted as to production and supply of competitive woods.

"I am perfectly aware of the fact that most of us are old salesmen who have been in harness a long number of years, and doubtless have a good working knowledge of our business, but what our employers want us to do is to grasp the finer and better points of our business. They want us to become experts; they want us to become men who can discuss our lumber in a frank, intelligent way, and to be able to convince our customers and prospective customers that we really know what we are talking about, and want us to be able to explain why we know what we are talking about. Any man here who is willing to admit the truth frankly (and I know we are all willing to do this), will admit that many a sale has been lost by a hesitating reply. It isn't that we don't know how to sell our lumber, and it isn't that we are not good salesmen, but it is because we must put more expert knowledge into our work; we must know more of our own wood, and we must learn more about our competitive woods."

Public Ownership of Timberland Advocated

Public ownership of timberland, national or state—with private cutting and marketing—was advocated by the Paper and Pulp Association's committee on forest conservation, in a report submitted to the Association conference held recently in New York city. Such ownership was said to be essential for the growing of the older and larger sizes of timber, its production being too long and hazardous an undertaking, with too little earnings to attract private capital in adequate amounts.

In line with this opinion, speedy adoption and executive of national and state forest policies, co-ordinated and co-operative, was urged. Forest surveys and land classification as first steps were declared necessary.

Public purchase of cutover lands by nation and states should be enlarged and extended to all parts of the country, the report said. It also advocated the vigorous and general extension of fire prevention co-operation between the nation and the states, state adoption of uniformly fair forest taxation laws, estimate of forest nurseries and the preparation of forest working plans. A large programme of forest planting on denuded lands which show little promise of new natural crops was urged.

The Present Selling Price Next Year's Cost

Lumber Stocks are Low, Producing Expenses High and the Demand May be Difficult to Meet—The General Outlook Reviewed in Some Details

Everything betokens stiff increases in the price of lumber next season in all parts of Canada and this observation is not made without due consideration and a general survey of conditions which are and will contribute to the ascension in values.

Labor is scarce at many points, restless and excessive in its demands. The general efficiency of a woodsman is only about 66 per cent. of what he was before the war, and it takes three men to do what two men formerly carried out. Stocks of lumber in all lines, both hard and softwoods, are low and never did wholesalers have less available quantities to dispose of than at the present time. There will be no dry lumber coming on the market until May or June next, and during the past season more lumber was sold and shipped green from the saw than was ever known in the history of the industry in the East. Some of the mills did not take the trouble to put the lumber on stick at all, but sent it out in carload lots to customers who demanded the product in any shape.

The increase in wages, the higher cost of camp supplies, particularly horse feed, and the general inefficiency of men will make logging costs from 10 per cent. to 15 per cent. higher than during the season of 1918-19. It, therefore, looks as if this year's selling price will be next year's cost price. The demand for lumber is bound to be large, not only for export purposes, but for home consumption, while there is an insistent call for white pine, hemlock, birch and maple from the other side of the line, where a tremendous building boom is foreshadowed.

In no product does the outlay for labor play as important integral a part as in lumber. Wages and the expenditure for feeding men constitute about 70 per cent. of the total cost of the product. In many parts of the country lumberjacks are getting \$70.00 to \$75.00 a month with board, which means a disbursement of \$110 to \$115 in order to keep a man on the job, and in some cases the bushwhacker is hardly worth his board let alone the wages, but the industry has to put up with this indifference and incompetence simply because sufficient help is not available in order to make a discriminating choice.

Everything being considered, lumber has not advanced as much in price as has hardware, glass, plumbing, brick, tile and other articles so universally used by the building trade. A general estimate, based on an accurate survey of all kinds of woods, places the advance around 65 per cent. The heaviest increases have been on the cheaper grades owing to the excessive call for them, as many builders have been proceeding on the principle of not how good, but how cheap can they erect houses. The better grades of lumber have not gone up anything in like proportion to the cost of production.

A well-known manufacturer estimated the other day that it was costing nearly 200 per cent. more to get out logs and drive them to the mill and convert them into the finished product than it did before the war, when wages were \$40.00 to \$45.00 a month, and good board could be supplied for 40c to 50c a day. Then the cost of all supplies was about 100 to 125 per cent. less than at to-day's market figures.

A cry has been heard about building operations likely to stagnate owing to the high cost of lumber, and that if there was only a drop there would be much structural activity. When it is considered that the expenditure for wood products, which includes joist, studding, flooring, ceiling, casing—in fact general interior and exterior trim—is on the average only one-fifth of the total cost of a house, it will be realized that the price of lumber does not play such a relatively important part. In building a house, costing anywhere from \$8,000 to \$15,000 not more than ten to fifteen thousand feet of wood goods would be used in its erection, and even if the price is from \$30 to \$60 per M higher, this is comparatively small when contrasted with the wages of carpenters, bricklayers and other trades now receiving \$1.00 an hour on numerous jobs.

Some manufacturers of hardwoods have withdrawn their price lists altogether. They have only odds and ends to sell and will not be in a position to furnish anything in quantities until early next year. The call has gone forth from automobile concerns, implement men, gramophone and piano makers, furniture producers and flooring manufacturers for birch, maple, oak and other allied lines, but the sources of supply are limited and practically any figure, no mat-

ter how exorbitant, can be secured. It is not now a question of price, but of getting the goods.

The situation is, not to speak of the probable demands from abroad, one that is causing much anxiety, and, while some are predicting a famine in lumber, it may not reach that acute stage, but may become neighborly near the mark. While the supply may not be "broken," it will be "badly bent," and reminds one of the rustic who went down to New York City with quite a large roll of bills and had a gala time. On his return home, somewhat saddened and impoverished, an acquaintance enquired concerning his experiences in the metropolis. The youth told him down to the minutest detail.

"You must have come home dead broke after all that," remarked his friend,

"No," mused the bucolic sojourner, "not broke exactly, but to tell the honest truth, I'm badly bent."

Smaller Lumber Production Across Border

On the basis of partial returns received by the Forest Service, United States Department of Agriculture, from 731 saw mills in all parts of the country, each of which cut in both 1917 and 1918 more than 5,000,000 board feet of lumber, the estimated total production of lumber in the United States in 1918 was 32,760,000,000 feet, as

Making permanent records of forest growth.

The man in the picture is determining the position of the trees by means of an alidade attached to a plane-table. Each tree has a number painted on its trunk and corresponding numbers are placed on the map. This is a material assistance in keeping a permanent record of the trees and simplifies the study of the progress made by them under different conditions from year to year. The portion of the plot shown in the picture has been slashed and the slash burned. For purposes of comparison the remainder of the plot has only been slashed.

compared with a production of approximately 36,000,000,000 feet in 1917. The decrease in 1918 was general, not being confined to any one region; but it was greatest in the southern and eastern states and smallest in the western states. The chief producing states in 1918 were: Washington, with a total cut of 3,250,000,000 feet; Oregon, with 2,000,000,000 feet, and Louisiana, with more than 1,500,000,000 feet. More than 500,000,000 feet was produced in each of the following states: Mississippi, California and Nevada (the two in one division), Wisconsin, Arkansas, Texas and Idaho.

CANADA'S COAL

There is much concern in Canada, particularly in Ontario, which province depends largely upon imported coal, over the source of coal supply for the present winter, because of the strike situation in the United States.

Just why this worry should make itself manifest seems somewhat of a mystery, when one stops for a moment to consider and investigate the situation. In Alberta we have 16 per cent. of the total supply of coal in the whole world. The heating value of Western coal has been tested by householders, manufacturers, railways, and power plants throughout Western Canada, and all concerned have found Western coal an economical and efficient fuel. Steam coal produced in the Crow's Nest Pass district compares very favorably with the very best United States steam coal, and big concerns like the Canadian Pacific Railway, the T. Eaton Company and the Winnipeg Electric Railway Company have adopted the use of this coal because of its qualities as an efficient fuel, linked up with a big saving in the annual coal bill. In Alberta we have over 300 mines, many of which are equipped with the most modern equipment, costing millions of dollars, and yet the annual production of these mines is only 40 per cent. of what could actually be produced. This is because of a lack of a market that can take all the coal mined. At present Western Canada imports about 3,000,000 tons of coal annually, valued at \$18,000,000. This huge sum of money is sent to the United States to pay for coal imported into this country. That money assists to develop United States industry. It helps to keep the overhead expenses of the mines low because of the fact that the more coal produced means less overhead expense. Again, by sending this \$18,000,000 out of Canada we are very materially affecting our already heavy adverse trade balance. The fact should not be lost sight of, too, that on this \$18,000,000 we must pay \$720,000 in exchange alone.

The whole trouble why Western coal operators have not made more headway in marketing their product is owing to a lack of educational propaganda—as it were, to a lack of pep. They have the product, the men, the equipment, and the market. But the operators must be assisted in their problems by everybody concerned in the welfare of the future of Canada. Daily and trade papers, boards of trade, wholesale and retail coal dealers, all must spread the propaganda that we have in Western Canada coal that has been tested and found to be equal to that which has been imported for so long. Emphasis should be laid on the following facts: one of Canada's principal industries will be materially assisted to develop; millions of money will be kept in the country and so help our adverse trade balance; equally as good heating values can be obtained from Western coal as from imported coal; the more Western coal used, the lower the overhead at the mines,

and consequently the lower the price to the consumer.

Alberta operators complain, and justly too, that their overhead expenses are very high through their inability to secure a market for slack coal, which is now merely thrown away. For instance, smaller mines in the Lethbridge field waste 50,000 tons of this product annually. Slack coal can be utilized to advantage in power plants. Such plants at Regina, Saskatoon and Winnipeg have burned this fuel with great success.

Another factor that is keeping back the development of the coal mining industry of the West is the high freight rate applied to the shipment of all grades of coal, especially on slack coal.

* * *

The "Western Canada Coal Review" in a recent editorial criticized very severely the actions of the Dominion Government and the Provincial Government of Manitoba in asking for bids for coal specifying that only United States coal was required. Why this discrimination? Why this encouragement to buy in foreign markets when an equal product is at our own doorstep? Why this apathy to our severe adverse trade balance? Why this discouragement of the development of our natural resources? Why this apathy towards assisting the employment problem in Canada? Perhaps the Government officials can answer.

As an instance of ignorance of even many Winnipeg manufacturers of the burning qualities of Western coal, a certain representative of a large coal mine visited Winnipeg in the Fall of 1918, and found a manufacturer was contemplating placing a big order for the best American steam coal to heat his power plant, not giving any consideration whatever to Canadian coal. After talking over the possibilities of burning Alberta coal in his plant, he decided to give it a trial. This year, the same manufacturer without any hesitation whatever, promptly gave this same mine another big order for his coal supply for the winter of 1919, saying only one word in reply to the mine's representative of what he thought of the coal: "WONDERFUL."

* * *

At present Ontario is faced with what looks like a fuel famine. Why should this be? At the moment of writing there are stored at the head of the lakes 250,000 tons of soft coal and 324,000 tons of anthracite, with additional shipments arriving as lake steamers arrive. Now, why should there be a shortage in Ontario when this supply is lying at the lakes ready for shipment into Western Canada? Does not this importation seem like "Carrying Coals to Newcastle"? Why should the Ontario Fuel Commissioner not commandeer all of this coal and divert it to Ontario and so help the serious fuel situation in this province?

Are we to sit still and smile, or act? Which is it to be?

Bolshevik Exponents Told to "Move Along"

Have Made Appearance in Eastern Logging Camps and Seek to Gain Recruits for One Big Union—How their Sinister Appeals are Made

The exponents of I. W. W. Bolshevism, Socialism, Soviet Government, One Big Union and all the other isms are making their appearance in Ontario and Quebec, and are beginning to get in their nefarious work. They are doing this secretly, quietly, but most persistently in the lumber camps of the eastern provinces. So smooth have been their methods of procedure and so insidious their practice that in not a few cases these exponents have worked for several days before their mission has been discovered by the operators and secured a number of subscribers to the One Big Union, known as The Lumberworkers' Industrial Union of the One Big Union. The appeal is made alluringly, the tone used is confidential and the general attitude of the agent invites confidence. The representative of the I. W. W. or Bolshevism comes into camp as an ordinary lumberjack, remains a few days and mingles among the men, talking on various subjects at first and gradually leading up to the main idea in view; then at the proper time a document is handed to those whom it is desired to enlist and they are asked to read it over. They are told in a suggestive way that what has been accomplished in the West can, with equal success, be carried out in Ontario, if the co-operation of loggers is secured, individually and collectively.

The entrance fee is only \$1.00 and what manner of men is there who would not put up this small initiation charge if he could obtain one tithe of the benefits and emoluments so enticingly presented by the glib-tongued, suave individual who can picture things in their most serene condition. In some cases where the listener is particularly easy, he is induced to pay not only the entrance fee of \$1.00, but also to hand over \$4.00 or \$5.00 extra in the shape of monthly dues, which are \$1.00 a month. In not a few cases this has been done in several camps where a fairly large sum of money was collected before the exponent of Bolshevism or I. W. W. was spotted, and told to move along.

The plan of campaign on the part of the Bolsheviks is as deliberate and far-seeing as would be conducted by a well-organized political party in order to win an election or carry a certain cause to victory.

General Warning Sent to Operators

All the lumber camps of Ontario and Quebec have been warned and their managers and foremen will be on the look-out for the lurking individuals who are seeking to spread a dangerous industrial doctrine and striving to build up their cause by a tissue of falsehoods and misrepresentation that could only find lodgment in the minds of the illiterate and those unacquainted with the actual condition of affairs. This class consists principally of foreigners who are working in the camps and know little about Canadian state of affairs.

It is the object of the Bolsheviks and I. W. W. agents to appeal to the discontented, the indolent, the ignorant, the grouchy and the easily-swayed members of any camp. However, it is thought, now that the lumber camps have been warned, there will be little or no difficulty in keeping a close watch on developments and inviting these "gentlemen," who come in to scatter such dangerous creeds, to proceed on their way.

Following is a copy of the leaflet that has been placed in the hands of a number of workers in camps. It purports to present what has been accomplished in British Columbia through the agency of the Lumberworkers' Industrial Union, and while some of the exactions have been met there is much of that outlined which has not been granted. The literature sets forth the demands of the men rather than what they have been successful in securing.

Road Between Desire and Realization

There is a long road between desire and realization, between planning and achievement, and when the loggers say they have obtained all that is portrayed in the leaflet, they are not only sadly misrepresenting affairs, but will stop at no end in the way of distorted statement and seductive appeal to gain their objective in the shape of the One Big Union.

Any other movement that seeks to cripple the lumbering industry, increase restlessness and discontent, hamper production and stamp out contentment and generally break down customs and institutions that have been tried and, after years of experience and insight, found not to be defective, should be promptly suppressed.

The attached circular, therefore, should not be taken too seri-

ously in view of the foregoing explanation, and it is given space merely to show how far some mistaken individuals will go in presenting a movement that has to be bolstered up by deceit, dishonesty, selfishness and greed:

What the Workers of British Columbia Have Done!

In January last, a number of lumber-workers on the Coast who realized that only in unity was there strength, got together and formed what was known as the B. C. Loggers Union, an organization embracing all camp workers.

The growth of the organization was marvellous; in fact there is not another labour organization that has increased its membership at the rate that this did. In nine months it exceeded eleven thousand paid-up members, and extended its activities over the whole of the Province of B. C. At the general convention held in Vancouver last July it was decided to affiliate with the One Big Union, and to change the name to the Lumberworkers Industrial Union of the One Big Union, and to extend its activities throughout the Dominion.

Since the organization came into existence the living and working conditions of the logger have improved tremendously; in many cases it has not been necessary for the men to take further action to secure the improvements, the existence of the organization being sufficient to cause the boss to come through, for he realized that the organized logger would not continue to accept those conditions which the unorganized worker was compelled to endure.

In the past, when the workers did not like a camp, they quit individually, and in a few days there were other men on the job, living under the same conditions, until they in turn quit in disgust, and another crew took their place. It was a common occurrence for a camp to have three crews, one going, one working, one coming; but now, instead of leaving the job and permitting such conditions to continue, the workers stay right there and see that the boss provides conditions fit for human beings.

The following schedule of camp conditions was drafted by the B. C. loggers at their recent convention, and is now in operation in the majority of the camps, particularly on the coast, where the camps are practically one hundred per cent. organized;

A minimum wage of \$5 a day. A strictly 8-hour day, camp to camp, with time and one-half for overtime, legal holidays and Sundays. Semi-monthly pay day. No contract, piece-work or bonus system. The employer to pay transportation to the job, but if the worker is not put to work, or is discharged before having earned twenty-five dollars over and above all expenses, including fare back to town, then transportation both ways to be provided by the employer. At boat landings proper landing facilities to be provided, with house adjoining, supplied with stove and wood. Transportation from boat or railroad to camp. No bunkhouse shall be less than 18x24, and not contain more than six single iron beds, each with springs, mattress, two double blankets, sheets, pillows and slips, and kept in sanitary condition; the sheets and pillow slips to be washed once a week, blankets once a month, and every time bedding is changed from one person to another; the employer to bear the cost of same. A stove to be placed in the centre of the bunk house. A wash-house, dry-rack and bath-house to be installed in all camps. The bath-house to be partitioned from the dry-house. Antiseptic soap and towels to be provided free. Hot and cold water to be provided. Toilets with light, 300 feet from all buildings. Kitchen staff to be provided with sleeping quarters separate from the kitchen. A sanitary store-room in connection with the kitchen. Meat houses not closer than 15 feet from kitchen. Earthenware to be used in place of enamelware; forks, knives and spoons to be of nickel silver. Dining room tables to be covered with oil cloth. Six men only to a table. Kitchen utensils to be of copper, aluminum or pressed steel. Dish-up table and sink to be lined with zinc. Buildings for

blacksmith and filer to be built suitable for this work. A reading room to be provided in all camps. The Health Act, in respect to camp sanitation, to be rigidly enforced. All complaints to be dealt with through the camp committee. Every employer who is situated more than 5 miles from the office of a medical practitioner, and employing one or more men, shall at all times maintain in or about such place of employment satisfactory means of transportation to carry all injured workmen to the nearest hospital. A licensed "First-aid" man shall be employed in camps where there are 10 to 25 men, and an additional one for every 25 thereafter.

Are you living and working under these conditions? If not! Why not?

Is it because you are not organized? If so the immediate remedy is right at your hand. **There are organizers in your district, ready to assist you to organize.** Camp-workers like yourself, and men who have proven the value of organization. Join up with them and immediately you cease to be an insignificant individual camp-worker, drifting aimlessly along at the mercy of the boss, and become instead a vital part of that mighty driving force—organized labor—which is powerful enough to improve the working and living conditions of all workers in industry. The organization is entirely in the hands of the members on the job. The members in a camp control their own activities. In each camp a delegate is elected. He signs up new members, collects dues, remits all moneys to and keeps in constant touch with the district headquarters, and generally looks after the business of the organization on the job.

Every man who has the desire to improve his conditions and with the initiative and back-bone to act for himself is urged to become a delegate. Men are wanted who are not afraid to do a little work; men who have the courage of their convictions; men who consider that they have the right to say under what conditions they will work and live. Are you that man? Are you willing to assist in improving the conditions of yourself and your fellow-workers, irrespective of what the boss may say or think? Do you consider that you have the right to organize with your fellow-workers? Or are you willing to drift along in the same old rut that your grandfathers did, ignorant of the fact that the world has changed since they trod the earth? Do you realize that changing conditions require new methods, and that if you want anything better in the shape of living and working conditions, and wages, that you must organize, must combine and co-operate with your fellow-workers, in order to get them? Have you a mind of your own, or do you let someone else think for you, and meekly do as you are told?

Prove your manhood! Think for yourself! Investigate the aims and objects, constitution and laws of the Lumberworkers Industrial Union of the One Big Union, and you will then do as 11,000 other camp-workers have done before you, JOIN IT.

Do it now. Entrance fee \$1. Monthly dues \$1. Make your aim to equal that of B. C. A 100 per cent camp. A 100 per cent. Province. A 100 per cent. Dominion. It's up to you!

If you desire further information write the District headquarters at Prince Albert, Cranbrook, Kamloops, Nelson, Princeton, Prince George, Prince Rupert, or the general headquarters at 61 Cordova St. W., Vancouver, B. C.

Pulp Prices Continue to Advance

There is great activity in pulp and paper securities and the latest company to make a public offering is the Saguenay Pulp and Power Co., which controls the Chicoutimi Pulp Co. (the largest producer of wood pulp in the world), the St. Lawrence Pulp and Lumber Corporation, the Saguenay Light and Power Co., the Roberval-Saguenay Railway Co., and the Chicoutimi Port Co. The Saguenay Pulp and Power Co. are now offering \$1,500,000 serial, gold bonds, bearing interest at six and a half per cent.

Hon. F. L. Beique is president of the company and, in a recent letter, he gives some interesting information regarding the activities of the organization and the steadily increasing price of ground wood pulp. Senator Beique says that the mills at Chicoutimi and Val-Jalbert have been running to capacity since the first of the year. Stocks of mechanical pulp, which had grown to over 60,000 tons, in the early months of 1919, have all been sold and shipped. It is understood that the bulk of the pulp has been disposed of in the Old Country. Steadily higher figures are now being secured for the output. The pulp, which the company sold last year and during the

first six months of the present year, brought from \$26 to \$29 per ton but quotations have now advanced to over \$40. The last sales were made at \$42.50.

In regard to chemical pulp the capacity of the plant at Chandler has been increased by forty tons a day and the output is now averaging 112 tons. Operating costs have been reduced by over \$10 per ton.

Sawmill and Much Lumber Burned

The smaller one of the two sawmills of the Brown Corporation near Trois Pistoles, Que., was recently destroyed by fire and several million feet of lumber were burned as well as about a hundred thousand cords of pulpwood. The damage is estimated at over a million dollars. The flames were particularly difficult to fight. The blaze started late in the afternoon and was fanned by a high wind, the mill being first wiped out and then the yard. The flames were kept from the larger of the two mills. A. Keens is the manager of the Brown Corporation for the district and the headquarters of the company are at Berlin, N. H. The company operate pulp mills at La Tuque, Que.

Mr. Thuerck Reviews Northern Activities

W. C. Thuerck, Haileybury, Ont.

W. C. Thuerck, Haileybury, Ont., who has charge of the northern interests of Terry & Gordon, of Toronto, has had a wide and varied experience in the lumber business, starting at the age of 14 with Noyes & Sawyer, of Buffalo, N. Y., first as tally boy in the yards, then in the planing mill, and finally in the head office.

After having served six years with the above mentioned firm, he severed his connection and entered the employ of Smith, Fassett & Co., of North Tonawanda, in the capacity of shipper and inspector, serving six years in this capacity, and obtaining a thorough knowledge of the grading of lumber, especially pine.

In November, 1911, Mr. Thuerck took charge of the Canadian operations of Smith, Fassett & Co., at Charlton, Ont., where he had full charge of the plant, yard and bush operations, increasing the capacity of the mill from 20,000 ft. per day of ten hours to a capacity of 40,000 ft., and a season's production of 9,250,000 ft. In November, 1916, Smith, Fassett & Co. sold their Charlton plant to the Beaver Board Co., of Buffalo, who are operating a barking drum on the saw mill site. Mr. Thuerck was engaged from November, 1916, till March, 1917, in making final disposition of Smith, Fassett & Co.'s stock at Charlton, and entered the employ of Terry & Gordon on April 1st, 1917, as their representative in northern Ontario.

Writing to the "Canada Lumberman" on November 1st, Mr. Thuerck states that they then had about three inches of snow and a wet fall which had delayed all bush operations. The high price being paid to settlers for pulpwood and ties has had the effect of turning operators to these lines rather than the production of logs. Present indications point to a cut about equal to last year's with less operators.

Terry & Gordon expect to produce about 2,000,000 ft. of spruce at Charlton, and had about one quarter of this quantity on skids on November 1st. They will also have about three-quarters of a million feet of Jack pine. They have a like quantity at Kenebeek on the Elk Lake branch; also about 300,000 feet of white pine of good quality at Osseo, which is also on the Elk Lake branch of the T. & N. O. railroad. They have started to cut about 500,000 ft. of Jack pine. These operations, including the sawing of the logs, will all be in personal charge of W. C. Thuerck. Terry & Gordon will also produce upwards of 100,000 ties during the coming winter and spring.

Mr. Thuerck was born in Buffalo in 1886, but became a naturalized Canadian five years ago. He is well-known and highly regarded in the North country.

Z. Mayhew, representing Simpson, Clapp & Co., wholesale lumber merchants, New York, was in Toronto recently. This firm specializes in Eastern spruce and B. C. products, lath, shingles, staves, etc.

High Lead Logging System in Eastern Canada

Skidders Are Now Being Put on the Market for This Modern Service—How Cost of Woods Operations May Be Greatly Reduced

By "Woodsmen"

A general idea of the high-lead system of yarding logs, or bringing the logs from the stump to the loading ground, as practised and developed on the Pacific Coast, is presented in the accompanying crude sketch. Many systems have been tested in that country of large and heavy logs, and this high-lead system has been found the most satisfactory of all for general work under ordinary conditions. For special conditions such as extra steep mountain sides, ravines, or for distances too great to be reached by the high-lead line, various other cable way systems are to be preferred; but these unusually difficult surface conditions are not found to such an extent east of the Rockies, and it is, therefore, believed by those who have studied the matter thoroughly that the high-lead system is the best one for general use all through Eastern Canada.

It is also thought that the time is not far distant when this system will be brought into use in most of the lumber camps of Ontario and the East by reason of the increasing cost of labor and supplies, and the generally poor quality of labor now available. It is simply a matter of getting better acquainted with the method and its advantages, including the low cost of installation and operation, and as soon as this knowledge becomes better disseminated, the lumbermen will be eager enough to avail themselves of the method.

Briefly stated, this high-lead system is simply a means of dragging the logs quickly along the ground, but with the forward end raised off the ground sufficiently to lead it safely around or over all obstructions. Thus only the one end of the log really drags the ground, and all the rest of the log is in the air. By this means the log arrives at its destination clean, and free of mud or pebbles, which are so apt to be forced into its surface by any of the ground haulage systems.

How the System is Operated

To secure this high-lead sufficiently high to thus hold the forward end of the log in the air in transit, the highest tree in the vicinity is selected, limbed and topped, and a block attached near the top, as shown. The skidding machine is then located near the base of the tree; the cable is run from the drum up through the block on the tree and out to the log, the hooks are attached and the log hauled in to the tree, and the hooks sent out for another log. In some camps the hooks are sent out by horse power, in others the line passes over a block at the far end of the course, and thence on to another block at the far end of the course, and thence back to another block on the spar tree, and down to a second drum on the skidder, which second drum and line returns the empty hooks to the far end of the run much quicker than a horse.

This return line is usually of smaller diameter than the main-haul line, as the strain on it is much less. This return line has to be twice the length of the mainhaul line, or a trifle more—that is, if the extreme length of the log haul is 600 feet the return line should be from 1200 to 1300 feet long. Some camps let this return line run along the ground, but at a sufficient distance from the path of the logs in coming in to avoid fouling. As this tends to wear the return line out quickly many operators attach the block for this return line high up on the spar tree to keep the line off the ground, which makes the line last from two to three times as long. Both of these methods are in daily use, and the choice depends largely on personal preference.

The need of this system all over Canada is great, but so far practically no effort has been made by any manufacturer of skidding machinery to supply this need except for the handling of the extremely heavy timber of the Pacific Coast, and the rest of Canada has either had to use the extremely heavy machinery designed for the Pacific coast—or go without. One Eastern logging company were so anxious to make use of this system, with light machinery properly designed for use with the general run of logs found in Eastern Canada that they sent a representative recently to tour the United States and inspect the best equipment manufactured and used in that country, but to their great disappointment, the representative returned with a report that all the United States machinery was too heavy for use in Eastern Canada.

Skidders Adapted for Eastern Use

To remedy this condition, and meet the demand for this class of machinery of the proper size, weight and price for use in Canada,

the enterprising firm of Marsh Engineering Works, Limited, of Belleville, Ont., have recently designed and are now putting on the market a number of sizes of skidders adapted for use with this high-lead system. These skidders are offered in both gasoline and steam drives, and the large range of sizes makes it possible for any operator in any section east of the Rockies to select from the list just the right size for his particular kind of timber and the distance to be traversed.

Regarding the distance from the spar tree up to which it is possible to clear the ground by this high-lead system, on the Pacific Coast it is customary to clear up to one thousand feet from the tree in all directions, avoiding where possible the necessity of dragging the logs across the railroad track. But with the shorter types of trees found in Eastern Canada about six hundred feet from the spar tree would be the maximum distance that could be properly

The high-lead method which may be brought into use in Ontario and Quebec Lumber Camps.

worked, as at a greater distance than this the forward end of the log would not be lifted off the ground high enough to clear obstructions. With the smaller and lighter type of machines now available for this work it is possible to move the outfit often at a minimum outlay of energy and money, which overcomes the difficulty.

As one operator says "Modern costs of labor and horse feed will help to introduce skidding machinery, which the East has been very slow to adopt." It is an old saying that "it is an ill wind that blows nobody any good," and this apparently ill wind of high labor costs is going to compel many lumbermen to adopt skidding and loading machinery to their own financial profit, for they will speedily find their operating expenses so much reduced by the use of this modern machinery that they will make more money than ever in spite of the increased costs of labor and all kinds of supplies.

Personal Paragraphs of Interest

C. M. Bartram, of Bartram & Ball, Montreal, is recovering from an attack of typhoid fever.

E. M. Bliss, President of the Bliss Lumber Co., Detroit, was in Toronto recently on business.

Leon Gagne, representing the Exchange Lumber Co., Montreal, was a recent caller on the Toronto trade.

John J. Miller, of the C. G. Anderson Lumber Co., Toronto, left recently on a business visit to the Maritime Provinces.

J. W. Mosher, of the L. N. Godfrey Co., Boston, has been on a buying trip to St. John, N. B., Montreal and Toronto.

W. C. Gall of the Gall Lumber Co., Toronto, who was laid up for several days with sciatica, is once more able to be at his desk.

Horace Hartley of Montreal, representing J. and D. A. Harquail Co., Limited, Campbellton, N. B., was in Toronto recently on a business visit.

J. A. McFadgen, President of the Manufacturers Lumber Co., Limited, Stratford, Ont., has returned from a successful deer-hunting expedition.

Chas. Pedwell, of McVicar, Ont., was in Toronto recently on business. He operated two mills during the past season, at McVicar and Lion's Head.

G. H. Askwith, assistant sales manager of the Riordon Pulp and Paper Company, Montreal, has been operated on for appendicitis. He is on the road to recovery.

G. C. Hurdman of the Hurdman Lumber Co., Ottawa, former representative of Ottawa West in the Ontario Legislature, spent a few days in Toronto recently.

J. L. Macfarlane, of the Canadian General Lumber Co., Toronto, who has not been feeling well for some time, is now improving steadily and able to attend to his duties.

M. McKinnon of Knight Bros. & McKinnon, Limited, manufacturers and dealers in lumber and builders' supplies, Cobalt, Ont., was in Toronto recently calling upon the trade.

J. W. Smith and W. R. Beatty of the Colonial Lumber Co., Limited, Pembroke, Ont., were in Toronto recently attending the annual meeting of the Canada Lumber Co. of Weston.

It has been arranged that C. A. Govan, of the Montreal office of the Imperial Timber Disposal Section, Board of Trade, London, shall sail for England by the "Carmania," leaving New York on December 17.

C. W. Wilkinson, General Manager of the Union Lumber Co., Toronto, is in Great Britain on a business trip and will look into the export situation. Before returning he intends to visit some of the battlefields of France and Flanders.

W. C. Laidlaw of the R. Laidlaw Lumber Co., has returned from Nairn Centre, Ont., where he spent a couple of weeks in deer-hunting. The party with which he was connected had rather indifferent luck, deer in that district being very scarce.

Keith Davidson, formerly a Lieutenant in the Royal Air Force, and partner in the plant of James Davidson's Sons, Ottawa, has after an absence of many months, resumed his activities in connection with the operation and administration of the big woodworking plant.

W. G. Paynes and Maurice Welsh of Campbell, Welsh and Paynes, wholesale lumber merchants, Toronto, returned recently after a successful deer hunting trip to Bass Lake in the Bobcaygeon district. The party, of which they were members, secured their full complement of deer.

Word has been received that F. V. Wyckoff of A. Wyckoff & Sons Co., Elmira, N. Y., manufacturers of wooden water pipe, passed away recently in the Johns Hopkins hospital in Baltimore. Mr. Wyckoff was very well known to the lumber trade in Ontario in connection with purchases which his firm have made for years.

C. G. Anderson of the C. G. Anderson Lumber Co., Toronto, and Norman C. Hocken, of the Hocken Lumber Co., Toronto, who were members of a hunting party which went to West River, near Little Current, Ont., have returned, having remarkably good luck. There were nine in the company and the full complement of deer was secured.

Lieut. Thomas A. Williams, Second Brigade, C. F. A., who recently returned from the front where he spent three and a half years on active service, has been admitted into the firm of the Williams Lumber Co., wholesalers and exporters, Ottawa. Lieut. Williams graduated from McGill as an electrical engineer just before going overseas.

J. D. McCormack, of Vancouver, General Manager of the Canadian Western Lumber Co., spent a few days in Toronto recently, calling upon members of the industry. He reports an active demand

for B. C. products with stocks very low. His own company has only about one-third of the lumber on stick, which it usually has at this season of the year and the market is very strong, particularly from across the border.

F. J. Niven, who for several years has been employed in the timber license department of the Ontario Government, has been appointed Secretary of the department of Lands, Forests & Mines, succeeding C. C. Hele, who has taken a responsible position with a financial concern in Toronto. Mr. Niven is thoroughly familiar with the work of the Department and should prove a valuable and faithful official in his new and responsible post.

John B. Reid, of Toronto, vice-president of the Ontario Retail Lumber Dealers' Association, and former chairman of the Lumbermen's Section of the Toronto Board of Trade, has retired from the active management of Reid & Company, his son, Capt. George T. Reid, now being in charge of the business. Mr. Reid, Sr., has not been feeling up to the mark of late, and has been ordered by his physicians to take a needed rest and conserve his strength as much as possible.

Major-General A. D. McRae, of Vancouver, spent a few days in Toronto recently on the way to visit his mother in Glencoe. It will be remembered that a few weeks ago General McRae addressed the Wholesale Lumber Dealers' Association on lumber conditions in the Pacific Coast Province. He has been carrying his right arm in a sling for the past few weeks, having been thrown from his horse while riding and sustaining a fracture at the wrist. The bone was knitting very well when he had the misfortune to fall in Winnipeg and break his arm a second time.

Hon. T. D. Pattullo, of Victoria, Minister of Lands for British Columbia, was in Toronto recently on his return from a business trip to Ottawa. He spent some time with Major James Brechin, B. C. Lumber Commissioner for eastern Canada. The latter will soon move into larger premises on the sixth floor of the Kent building, corner Yonge and Richmond streets, where he will have double the office space, part of which will be used for the display of British Columbia forest products. Major Brechin recently spent several days in western Ontario in propaganda work.

New Wholesale Lumber Firm Organized

Anderson, Shreiner & Mawson have embarked in the wholesale lumber business and opened offices in Rooms 5 and 6, Phoenix Bldg., 43 Victoria St., Toronto. They will deal in all kinds of Ontario woods, and the firm are S. R. Anderson, who is widely known as a lumber salesman from his long connection with the industry, W. C. Shreiner, President of the Eagle Lake Lumber Co., Limited, and Harry (Pink) Mawson, Secretary-Treasurer of the Eagle Lake Lumber Co. All the members of the new organization have had wide practical experience in the lumber business and for many years were engaged with the C. G. Anderson Lumber Co. They will sell the output of the Eagle Lake Lumber Co., consisting of birch, hemlock and spruce, and will also handle other woods. Mr. Anderson recently left on a trip to Great Britain and will not be back until the end of January. Mr. Mawson is in charge of the office and has taken up his residence in Toronto. He recently joined the ranks of the benedicts and is receiving the congratulations of many friends.

Anderson, Shreiner & Mawson expect to develop a large business and have already established favorable connections. The Eagle Lake Lumber Co. operate two mills at Eagle Lake and King Lake in the district of Parry Sound, and cut nearly a million feet during the past season which will be shipped out during the coming winter.

New Operating Company Organized

The Elk Valley Lumber Co. has been organized and the purpose is to operate the timber limits of the Seippel Timber Co., better known as the Cedar Valley Timber, and the saw-mill plant of the Elk Lumber Co. of Fernie, B. C. J. S. Hough of Winnipeg, is President of the new company and also President of the Elk Lumber Co. H. D. Campbell of Stillwater, Man., is General Manager. The company intend to carry on a large operation, and new camps have been constructed on the limits, about four miles from Fernie, and sufficient logs will be taken out for a mill cut of many feet. The logs will be brought down from the limits to the mill by means of a standard gauge railway about four and a half miles in length, which is being built at the present time. The new company will also operate the camps of the Elk Lumber Co. in West Fernie, B. C. The company has its headquarters in Winnipeg. The Seippel limits upon which the major part of the operations will take place, contain sufficient merchantable saw timber to insure at least a ten years' operation.

Hauling Heavy Ship Timbers by Motor Truck

Toronto Firm Specialize in Handling Rock Elm Trees for Export—How the Wood is Bought, Cut and Hauled to Cars—Its Characteristics

S. E. Hall, Toronto.

Hall Bros. Limited, of Toronto, have built up a large lumber business by means of specialization, and one of the particular things to which they devote attention is getting out Rock Elm for shipbuilding. Their operation in this line is, possibly, the only one of its character in the Dominion, and is, therefore, worth more than passing notice. It is a fact that Rock Elm is not an abundant wood in Ontario and its characteristics are little known.

In addition to conducting two sawmills near Marlbank in Hastings County and carrying on lumber camps, Hall Bros. keep up with their activity in Rock Elm the year round. Before the war they worked up a large trade in hewn Rock Elm timber. Rock Elm is purchased in whatever

section the firm are able to locate it. The timber is somewhat widely scattered, but Hall Bros. have men constantly on the search for this particular wood and they generally know from the topography of the country where such timber abounds. There is no great quantity of Rock Elm in Ontario but in certain districts quite a sprinkling can be found. Rock Elm generally grows in clusters from twenty-five to one hundred trees on high ground either of a rocky or sandy character. The timber is particularly strong, tough and durable and is in every way well adapted for shipbuilding purposes whether used above or below water, for ships' decking, timbering, flooring, etc. There is no wood quite as well liked in the Old Country for this work as the Canadian Rock Elm. It is for the most part straight grain and will last an indefinite period. It will also bend and possesses other advantages that need not be enumerated.

Taking Out Shipbuilding Timber

In 1917 Hall Bros. took out about 2,500 sticks of Rock Elm, both square and round, or some seventy-five carloads, and last year their business was over double that. Most of this wood is placed on the cars and shipped to Quebec for the Old Country. Before the war Hall Bros. conducted their own negotiations direct with Old Country firms, but of late have been doing business through Canadian organizations who maintain offices and have permanent representatives in Britain. It is interesting to note that the timber now being shipped is largely in the round log.

Hall Bros. have gangs of men cutting down the trees during the Fall, Spring and Winter, and this year have shipped about seventy-five cars from certain districts within 60 miles of Toronto. The timber is inspected at the loading point for export. The standing trees are bought from farmers and others at \$30.00 per 1000 ft. log measurement, and Hall Bros. dispose of the product on a cubic foot basis. The difference in price between square and round timber is about 25c per cubic foot. The trees cut range in length from twenty to fifty feet and the average is about thirty-five feet. Each log, when sawn into lumber, would make, probably, from three hundred to one thousand feet. The logs, or, more properly speaking, trees, are shipped on flat single and double cars about twenty-five to thirty trees being on each car. A gang of three men will cut and fell about thirty to thirty-five trees a day.

Motor Truck Does Good Work

The hauling is done to the nearest railway station by means of teams and also by a heavy five-ton motor truck, which the firm have been using with considerable success during the last few months. They contend that it does as much work as four teams and thus effects a material saving not only in cutting down time and distance but in outlay as well. The truck used is an Acason, manufactured by the Acason Motor Truck Co., Detroit, is a forty-five horse power machine, with four cylinders, four gears ahead, and has a capacity of five tons. Not only will the truck itself carry short

timbers but it hauls wagon trucks or trailers attached by means of a pole and chain. The wagon trailers, the reach of which can be lengthened to fifty feet or more so as to take on the longest trees as possible, carry from two to five and six round sticks of timber. With this load the heavy truck travels along the highways at ten to twelve miles an hour without any difficulty, whereas an ordinary team of horses will not make more than four miles an hour on the average and cannot pull nearly as heavy a load. Hall Bros. maintain that the use of a heavy duty truck largely solves their rural transportation problem and has enabled them to conduct operations much more expeditiously and economically than they have been able to achieve heretofore. The outlay for oil and gasoline averages \$5.00 a day

Heavy duty motor truck of Hall Bros., Toronto, conveying rock elm logs from the bush to the point of shipment.

and then there are wages of a driver and a helper. All the other men are kept in the woods drawing the fallen trees to one loading spot. The round sticks of timber are then deposited on the trucks, which are hauled to the edge of the bush by horses so that a motor truck can be readily attached to the wagons and the timber hustled out without any delay or obstruction. It is easy to make four trips a day from six to eight miles each way, and if the roads are good, as many as five trips can be accomplished.

Does as Much as Four Teams

Hall Bros. compute that the motor truck will do as much as four teams of horses,—not taking into consideration operation in the bush but merely the hauling of the timber. They believe that the saving can be reckoned on the following basis, not counting, or course, depreciation, but merely the cost of each day's operation.

Motor Truck, Oil and Gas	\$ 5.00
Wages of a Driver and a Helper	7.00
	<hr/>
	\$12.00

Four teams of horses and drivers at \$8.00 each—\$32.00, thus a saving of \$20.00 is actually effected in hauling timber by the motor method. Of course, there has to be made a certain allowance for wear and tear, but it will be seen that the difference is one worth while considering in the log problem in the Summer and Fall months. It would be impossible to operate successfully and economically during the Winter season or when the rains have been exceptionally heavy. Under fair normal conditions, however, Hall Bros. are convinced that the truck is the proper thing in their business, and next season its use will enable them to further extend their operations in handling Rock Elm from the bush to the shipping point.

Rock Elm is used for garbage stringers and planking in shipbuilding, and, as stated, the trees are from twenty to fifty feet and varying in diameter at the point from fourteen to twenty-two inches.

Hall Bros. have just concluded drawing in the district referred to some fifteen carloads of sticks, which have been handled in remarkably quick time considering the weight and size of the timber.

S. E. Hall is president of Hall Bros. Limited, J. M. Hall first

Loading a trailer in rock elm bush preparatory to an eight mile haul.

vice-president and T. G. Hall second vice-president and they all come of a family that has been in the lumbering industry for many years in Bruce and Grey counties.

Fraser Companies Building Two New Mills

The Fraser Companies, Limited, of Edmundston, N.B., are erecting a new saw and shingle mill at Campbellton, with a capacity of 150,000 ft. a day of lumber, and 125,000 shingles for the sawing season. The mill will be equipped with two double-cut band saws. They are also building a small double-cut band saw mill at Magaguadavic. The Fraser Companies will have, when these latest additions are completed, no less than twelve saw-mills located at Edmundston, Magaguadavic, Baker Brook, Plaster Rock, Fredericton, Nelson and Campbellton, N. B. and Cabano, Glendyne and Estcourt in Quebec. The company also operate a large bleached sulphite mill at Edmundston. The principal products of the Fraser Companies are rough and dressed spruce, white cedar shingles and railway ties. They make a specialty of piano sounding board stock. All the mills of the company are equipped with band-saws and the installation at the plants is of the very latest type.

More Squabbling on Wooden House Problem

An explanation of the attitude of the British Ministry of Health towards wooden houses was given last week in the House of Commons by Dr. Addison, the Minister of Health. Canada is interested to the extent that Great Britain is looking to this country to supply whatever houses are required. The action of the Ministry has been strongly criticized by what Dr. Addison termed "freak newspapers," but he refuses to be stampeded into urging local authorities to build dwellings which may prove unsuitable for English conditions. The Ministry do not condemn wooden houses—the point made against them is that houses of the Canadian type will have to be altered if they are to be made suitable and that the cost will be almost as large as brick dwellings.

There is a movement to convert army huts into dwellings to meet the emergency, but experiments show that these are cold. "We knew that all along," the Minister said. Even so, there was a considerable amount of extravagant building. The Government proposal to give a subsidy of 150 pounds sterling per house was limited to a certain number of houses to be built within a limited time. "The Government," he added, "would be no party to delivering the country again to the sporadic system of house building, which has given us slums in every town."

In the present condition of the woodworking industry of B. C. and in the East it may be questioned whether Canada is in a position to deliver a large number of houses very promptly. Advices from the Pacific Coast are to the effect that the firms making these houses are exceptionally busy.

Big Exhibition of Empire Grown Timber

The British Trade Commissioners in Canada have been notified by the Department of Overseas Trade of the British Government that the Department are organizing an exhibition of timbers grown within the British Empire to take place in London from the 5th July to 17th July, 1920.

The classification embraces—

- (a) Specimens of Timber (polished and unpolished);
- (b) Exhibits demonstrating the various uses to which timbers are put, viz., floors, panelling, staircases, furniture, ply wood, and articles of everyday use;
- (c) Wood pulp.

A committee has been formed to arrange all details connected with the Exhibition, and includes representatives of—

- Colonial Office.
- Crown Agents for the Colonies.
- Government of India.
- Self-Governing Dominions.
- Forestry Authority.
- British Societies interested in the production and utilization of timber.

The main object of the Exhibition is to bring prominently before architects, inspectors, firms who have to specify timbers in their contracts, as well as the users and consumers of timbers, the full range of Imperial grown timbers and especially those timbers which up to the present are only very slightly, if at all, known in this country, and at the same time to demonstrate the chief uses for which such timbers are suitable.

The building in which the Exhibition will be held has a gross area of 40,000 square feet, and it is felt that this Exhibition should afford a most favorable opportunity for displaying the various grades of timber produced in the British Empire.

A catalogue will be issued giving full particulars of all exhibits displayed, and in order to arrive at uniformity in the compilation of this work it is suggested that at least the following information should be inserted:—

- (a) A short concise statement regarding each kind of timber exhibited, showing the size in which it is usually obtainable, and the purpose for which it is specially suited; also giving the following particulars, viz:—
 1. Weight in lbs. per cubic foot.
 2. The result of tests carried out with regard to
 - Tension,
 - Compression, both with and across the grain,
 - Detrusion,
 - Modulus of Rupture,
 - Modulus of Elasticity,
 - Fire Resistance.
- (b) A list of the shippers of the various kinds of timber in each of the Dominions.
- (c) A list of importers and large timber merchants in the United Kingdom who would be prepared to supply the various timbers to users in this country.

It is hoped that the Catalogue will not only be useful to visitors to the Exhibition but will in future serve as a book of reference on all commercial timbers grown within the British Empire.

The British Trade Commissioners in Canada are as follows:—G. T. Milne, O.B.E., 367 Beaver Hall Square, Montreal; F. W. Field, 260 Confederation Life Building, Toronto; and L. B. Beale, 610 Electric Railway Chambers, Winnipeg.

The North Wants More Consideration

Once more the talk is heard of a probable secession of the Northern part of Ontario from the South. This movement, it is said, is gaining ground, the discontent arising owing to allged lack of proper recognition for the mining and lumbering districts. It is rumored that a monster convention is being planned and will be held during January, to give expression to the feelings which prevail in certain quarters. This agitation is no new thing and may not be very deep rooted or firmly entrenched if the new Provincial Government gives adequate consideration to the mining and lumbering activities of the North and to their importance, requirements and development.

Italy needs immense quantities of lumber. Before the war about 75 per cent. of Italian lumber imports were drawn from Austria; it is now conceded that Switzerland, Canada and the United States are the only sources of supply. North America can ship all the lumber that can be spared, according to the statements of an Italian Government official. A great area, estimated at over 1,000,000 acres, was completely destroyed along the Italian front during the war. This waste calls for a very large reforestation policy being adopted.

Wood Preservation Means Much to Industry

Reduces Cost of Upkeep Where Timber is Used in Exposed Service—Combatting the Principal Agencies Which Bring About Deterioration

By W. Kynoch, B. Sc. F., F. E. (Tor.), Acting Supt. Forest Products Laboratories of Canada, Montreal.

W. Kynoch, Montreal,
Acting Supt. Forest Products Laboratories

I have no doubt that many of your readers are aware that the preservative treatment of timber is a fairly wide subject. It is not my intention this time to attempt a detailed discussion of any one of the many phases of the question. I shall endeavor merely to deal with it briefly and in a more or less general way going a little into detail, perhaps on some points.

The advancing cost of timber generally and the increasing difficulty in obtaining supplies of naturally durable woods have brought home to the consumer the fact that wood preservation is an effective means of prolonging the life of timber, and thus of materially reducing cost of upkeep where timber is used in exposed service. An important consideration also is that efficient

preservative treatment enables woods of poor natural durability, but which otherwise may be excellently adapted for certain purposes, to be used for such purposes.

The very important influence which it is possible to exert in the direction of conserving forest resources by means of the preservative treatment of timber should certainly not be overlooked. It has been estimated that if all the railway ties, poles, mine timber and other products adapted for treatment in the United States actually received such treatment an annual saving of some 6,000,000,000 board feet, representing a monetary saving of some \$72,000,000, could be effected.

Perhaps some idea of the extent of the wood preserving industry in the United States may be conveyed by the statement that every year somewhere about 140,000,000 cu. ft. of timber receive preservative treatment. This includes some 35,000,000 ties, almost twice the total yearly tie consumption of Canada in the years immediately preceding the war. This figure is a fairly conservative one. It has been considerably exceeded in some years.

Timber Treatment on Large Scale

In Great Britain timber preservation is practised on an extensive scale. The treatment of railway ties, telegraph poles, piling, wood paving blocks, etc., is standard practice. In France, Germany and some other European countries we have practically the same condition of affairs. In Canada there have been certain conditions which have delayed the adoption of timber treatment on a large scale, but the indications are that we may expect a rapid expansion of the wood preserving industry in the near future. I believe it is not more than some 13 or 14 years ago since treated railway ties were first used in this country. Since that time a small number have been used each year, this number, however never exceeding 10 per cent. of the annual consumption, and usually being considerably lower than that. A rapid increase in the number of ties treated yearly will without doubt take place in the next few years.

Wood preservation has been defined as "the art of protecting structural timber from deterioration by destructive agents." The principal agencies which bring about such deterioration are decay, wood boring insects and marine borers and, of these, decay is by far the most important.

If we are going to take intelligent measures to guard against the decay of timber, the first thing to consider or to find out is what causes the disease. If we know or can determine this and if we also inform ourselves as to the character of the tissues which are open to attack, we have taken the initial step in the direction of preventive measures.

It is certainly time that widespread misconceptions are current regarding the decay of wood. It is a very common occurrence to find people who have been dealing with timber all their lives and who are continually being confronted with the phenomenon of decay,

entertaining totally erroneous ideas about it and citing many merely contributory factors or chance circumstances as causes.

The decay of timber is due to the action upon it of low forms of plants known as wood-destroying fungi and bacteria, and is practically wholly brought about by the former. This conclusion has been reached as a result of exhaustive scientific research and thousands of carefully conducted tests, carried out in the various civilized countries of the world. Incidentally, decay of wood can now be induced or prevented at will in the laboratory.

How Decay in Timber is Caused

In the case of an ordinary "green" plant, food materials are drawn chiefly from the soil. A wood-destroying fungal plant, however, derives its nutriment directly from wood substance. The fungus chemically decomposes certain constituents of the cell walls of the timber, converts them into assimilable substances and utilizes these for further growth and development. The active part of the plant consists of a number of minute thread-like filaments, which perforate the walls of the wood cells, break them down chemically, and ramify through and through the timber. Under certain circumstances these filaments grow out to the surface of the wood, where aggregations of them give rise to structures known as fruiting bodies, which, for every species of fungus are of characteristic shape, color, etc. When present these provide a ready means of ascertaining what species of fungus is growing within the wood. The function of the fruiting body is to produce spores, extremely minute and light structures which correspond to the seeds of higher plants. Spores are formed in enormous numbers, are released into the air when ripe, and are widely distributed by air currents.

Infection of sound timber is brought about in two ways, namely by contact either with spores or with living fungal filaments under favorable conditions. The popular idea that the "germs of decay" are inherent in timber per se is entirely erroneous.

Certain conditions are essential to the growth of these fungi. There must be food material (i.e. wood), a suitable percentage of moisture therein, a favorable temperature and a certain amount of air within the wood.

Prevention of Fungi Growth

Note, therefore, that there are four essentials for the action of fungi. It is obvious then that if fungal growth is to be prevented at least one of these four essentials must be so modified or controlled as to become unfavorable to fungal growth. Timber continually completely submerged in water is deprived of air, so lasts for thousands of years in some cases. Wood kept very dry does not contain enough moisture to permit fungi to grow, so may remain sound almost indefinitely. Under ordinary circumstances one cannot by any easy means prevent the ingress of air into timber. Nor can one control the temperature of the outdoor air. To prevent moisture from getting into wood in outdoor service is also extremely difficult, although some processes aiming at this have been devised. There is still one factor, the wood itself.

It will be readily perceived that the simplest way to prevent decay is to impregnate the timber with some material which is poisonous to wood-destroying fungi; in other words to poison the food supply of the plants. If this is efficiently done it becomes chemically impossible for the fungi to act upon the timber.

The very first requirement for a wood preservative, therefore, is that it be strongly toxic to wood-destroying fungi. All materials which do not possess this essential property may be immediately dismissed from serious consideration as preservatives. Toxicity is usually tested by determining the smallest quantity of preservative which will inhibit the growth of a known fungus. Toxicity, however, is not the only requirement; a good preservative should also be:—

- (a) Permanent—Therefore must be a reasonably stable substance; must not be dissociated under the temperature and other conditions necessary for its application; must not be volatile or highly soluble in water.
- (b) Readily and cheaply obtainable in large quantities.
- (c) Non-corrosive of iron, steel, etc.
- (d) Non-injurious to wood—must not act chemically upon

the wood substance so as to reduce its mechanical strength.

- (e) Non-injurious to health of workmen.
- (f) Easily applied.
- (g) Able to penetrate wood easily.
- (h) In case of use for ties must not short-circuit electric currents.

In some cases odor is important and also the question whether or not the preserved wood can be painted.

Probably hundreds of materials have been proposed for use as wood preservatives, but the great majority of these fail to fulfil or even approach the fulfilment of the requirements just stated. Those which have been most successful in this respect may be divided into three classes:

1. Water-soluble preservatives.
2. Crude oils.
3. Creosote oils.

Water-Soluble Preservatives

A large number of this class of materials has been tested at various times, but many are either of too low toxicity against fungi or react chemically with wood substance, reducing its mechanical strength. The best results obtained with this class of preservative have been secured with several metallic salts, namely mercuric chloride, copper sulphate and zinc chloride. Sodium flouride and some other flourine compounds have been more recently used, especially in Austria and Germany, with promising indications.

One of the most serious drawbacks to the use of all these materials for the impregnation of timber for outdoor service is the fact that they are more or less readily soluble in water and, therefore, while they are easily applied are liable also to be easily removed or leached from the wood. They are most valuable therefore in localities where the annual precipitation is low. It appears to be true of these water-soluble preservatives that when injected into timber, a certain amount of the injected material is permanently combined with, or at least permanently held, in the wood substance. Leaching tests show that prolonged soaking or washing fails to extract from the wood all that was put into it. It has never been shown, however that the material thus fixed in the wood is sufficient to protect it against fungal attack. The proportion thus retained evidently undergoes some physical or chemical change, and this change may impair or destroy its toxic properties, so that the fact that such a phenomenon occurs may or may not be of any significance. A great deal remains to be found out regarding questions of this kind. Of the salts mentioned a few moments ago, namely copper sulphate, mercuric chloride and zinc chloride, the latter has proved to be the best, all things considered.

Copper Sulphate, which was first used about 1840 in England and France, is cheap and initially of fairly high toxicity against wood-destroying fungi. It is readily leached from the wood. The chief drawback in its use is its action on iron and steel. As you know copper is immediately deposited when a piece of iron is brought into contact with a solution of copper sulphate. This makes it impossible to use it in the ordinary type of wood-preserving plant.

Mercuric Chloride, whilst very strongly toxic against wood-destroying fungi (in fact it is the most toxic preservative used) and much less easily soluble in water than either copper sulphate or zinc chloride, is very expensive and has a strong corrosive action on iron. It, therefore, cannot be used in the ordinary type of wood preserving plant. An interesting point in this connection is the use, in Germany, of treating cylinders, with the necessary piping, etc., built of reinforced concrete.

Sodium Flouride is more toxic than zinc chloride, is less easily leached from the wood, is less corrosive on iron than zinc chloride, and very much less than mercuric chloride. It has been subjected to exhaustive tests by Malenkovic, in Austria, with very promising results. It is a comparatively new preservative, however, and at present cannot be readily and cheaply obtained in large quantities in Canada or the United States.

Zinc chloride is the most widely used water-soluble preservative. It has been in continuous use since 1838, when it was first employed for the purpose in England. At the present time its use in Great Britain is extremely limited, but it is still extensively used in France, Germany, Holland and other European countries, largely for the treatment of railway sleepers. In the States about 20,000,000 pounds of this material are annually used, chiefly for tie treatment. It is cheap and strongly toxic against fungi. It has several drawbacks, perhaps the most serious being its very easy solubility in water, which, of course means leaching in exposed service. It is only slightly corrosive on iron at the concentrations used in treating timber, but it is usual in commercial practice to make a higher allowance for depreciation on a plant operating with zinc chloride than where creosote oil is used. Zinc chloride solution at high concentrations at-

tacks wood substance, but at strengths used in their preservation (1½ to 3½ per cent.) does not appear to be injurious at ordinary temperatures.

A feature common to these water-soluble preservatives (except copper sulphate) and which is advantageous for some uses of treated timber, is that they do not impart any color or odor to wood, and that they do not act on paint; so that the treated wood can be painted. A disadvantage (a serious one in the case of ties), is that the treated timber should be piled for drying subsequent to treatment, thus necessitating a second seasoning period. This is, of course, not the case with creosote oil.

Crude Oils

Little need be said about this class of materials. As a rule their toxicity to wood-destroying fungi is practically nil. The object aimed at in using them is to water-proof timber that has been thoroughly dried and by preventing re-absorption of water to keep the wood below the moisture content necessary for fungal growth. It is very difficult to secure any appreciable depth of penetration with these oils, so that in practice we get a mere surface coating which is readily pierced or broken in use, (say for ties), and moisture thus admitted. This, together with their non-toxic character, constitutes a serious objection to their use. They are very little used commercially. Perhaps it may be of some interest to mention the McMullen process, invented by the late Mr. McMullen of Picton, Ontario, which consisted in drying ties or other timber in a special kiln, subsequently dipping them into a petroleum residue and finally applying fine gravel to facilitate handling and prevent the ties from adhering to one another when piled.

Creosote Oil

The creosote oils are the most widely used and most generally efficient materials at present in commercial use for the preservation of timber. Creosote has been in continuous use since 1838 (about 80 years) when it was first employed in England for the purpose by John Bethell. It is strongly toxic to fungi (being about equal to zinc chloride in this respect), has a considerable water-proofing effect on timber, is fairly cheap, readily obtainable in large quantities, penetrates timber fairly easily, consists largely of practically insoluble substances and in short, conforms more nearly to the requirements of a good preservative, as stated a few minutes ago, than any other material at present known. It is not without objectionable features, not by any means an ideal wood preservative, but all things considered, is the best in sight at present.

The subject of creosote oils alone is quite an extensive one and would be well worth going into in detail. We might just glance for a few minutes at this subject in a general way, mainly in order to note that creosote oils may vary widely in composition, and in value as preservatives of timber.

The term "creosote oil" or "creosote" as now understood, has been defined as "a distillate heavier than water, obtained by the distillation of a tar or a tar-like substance." The most important commercial tars from which creosote oils may be obtained are three in number—Coal-tars, oil-tars, and wood-tars.

Coal-Tars—Obtainable chiefly in:—

- (a) Destructive distillation of bituminous coal at high temperatures (1500 to 3000°F) as carried out in the manufacture of illuminating gas and coke in gas house plants and by-product retorts.

The tars obtained vary considerably according to the coal, retorts, temperature, etc., but the main features are—presence of tar acids and hydrocarbons of the aromatic series.

These Features are Characteristic of Coal-tar Creosotes

- (b) Combined distillation and combustion of bituminous coal at lower temperatures.

Tar acids are present but hydrocarbons are mainly of paraffin series. These tars are not important to us just now.

Oil-Tars—Obtained in:—

- (a) Manufacture of water gas in which petroleum "gas-oil" together with coke or anthracite coal is employed. Main features are absence of tar acids, and presence (in small quantity) of hydrocarbons of paraffin series.

- (b) Destructive distillation of crude petroleum in the manufacture of oil gas. Main features are absence of tar acids and presence (in much greater quantity than in (a)) of hydrocarbons of the paraffin series.

These Features are Characteristic of Oil-tar Creosotes

Wood Tars—Obtained in:—

- (a) Destructive distillation of coniferous or deciduous woods (chiefly coniferous). Main features are presence of tar acids and vola-

tile constituents in large proportion (much larger than in coal tar creosotes) and small proportion of naphthalene and anthracene.

These Features are Characteristic of Wood-Tar Creosotes

(Wood-tar creosotes are more corrosive on iron than coal-tar creosotes because of high proportion of tar acids—these could be removed, however.)

The most valuable of these materials for wood preserving is coal-tar creosote and its value appears to be largely due to the high proportion of aromatic hydrocarbons or their derivatives present—it consists almost wholly of these.

Adding Tar to Creosote Oil

In practice creosote is often mixed with refined tar of various kinds or coal-tar creosote may be mixed with water-gas tar creosote, and so on. The question of adding refined or unrefined tar to creosote oil has given rise to a great deal of discussion and there is much to be said on both sides. The addition of tar tends to lower the cost of the preservative and may be of some advantage in increasing the water-proofing effect of the treatment. Adding tar, which contains much free carbon, tends to decrease the power of the preservative to penetrate timber, but refined or filtered tar may be open to this objection to the same extent. However, any addition of tar, whether refined or not, increases the viscosity of the preservative and decreases its power to penetrate—although this difficulty may perhaps be partly overcome by raising the temperature of the preservative during treatment. Again, the addition to creosote of anything servative. Any increase which can be made in the water-proofing series, such as oil-tar, will probably reduce the toxicity of the preservative. Any increase which can be made in the water-proofing power of the preservative is of particular value in the case of wood paving blocks.

More Research Work in Creosotes

There is considerable difference of opinion as to the character of creosote oil best suited for the treatment of timber for various purposes. The lighter constituents are apparently the more toxic, but are also the more soluble in water, whilst the heavier ones, whilst less toxic to fungi, are practically insoluble. Obviously creosotes can be manufactured to conform to various specifications, and there is still a need for more research into this subject. Many of the proprietary preservatives on the market are special creosotes, and some of these possess certain advantages on account of uniformity of product and for other reasons. It is highly questionable, however, whether there is any justification for the high prices charged for these materials in some instances.

Standard specifications for creosote oil for the treatment of ties and paving blocks, etc., have been developed and adopted by the American Wood Preservers Association, The American Railway Engineering Association, The United States Forest Service, and others.

I think it will be clear from what has been said that this subject of creosote oils is a fairly extensive and important one.

A word now as to the method by which preservatives are applied to wood. These may be divided into two classes:

- (1) Non-pressure processes.
- (2) Pressure processes.

Non-pressure processes include the application of the preservative with a brush, dipping the timber, and more or less prolonged soaking in the preservative. These methods, especially the soaking, are of considerable value for the treatment of timber for certain purposes. Pressure processes are those which involve the use of higher than atmospheric pressures in order to force the preservative into the wood. Where timber is subject to mechanical wear and abrasion, as in the case of railway ties, paving blocks, piling, etc., it is absolutely essential that a deep penetration of the preservative into the timber be secured. A surface coating, or a very shallow penetration (say a sixteenth or an eighth of an inch), which can easily be pierced or broken, is of practically no value.

Forcing the Preservative Into the Wood

The obtaining of this essential feature, deep penetration, involves the employment of pressure to force the preservative into the wood. Some of those present are, I believe, familiar with the modern wood preserving plant, but for those who are not I may say that such a plant consists essentially of one or more steel cylinders with a capacity of say 500 to 800 ties each, together with the necessary pumping and vacuum machinery, boilers, gauges, thermometers, working and storage tanks, etc. A large and well-drained seasoning or storage yard for the accommodation of ties and timber is also an important adjunct to the modern treating plant.

There are a dozen or more pressure processes in use which differ in various particulars. I do not propose to describe these in detail. Pressure processes, in which creosote oil is used, are sometimes differentiated into "full cell" processes, in which the object is practically to force as much preservative into the timber as possible, and

"empty cell" processes, in which the object is to saturate the cell walls of the wood without leaving any free oil in the cavities of the cells. Empty-cell processes aim at decreasing the cost of treatment by using less preservative, while at the same time securing deep penetration.

The maximum temperatures and pressures employed commercially are 200°F and 200 lbs. per square inch respectively, and in all processes means are provided for controlling the temperature of the preservative and the pressure applied to it at all stages of the operation. In some processes the timber is subjected to a preliminary vacuum, which is broken by the admission of the preservative, after which pressure is applied, the object being to do away with any resistance to the entrance of the preservative which might be offered by the air in the wood cells and thus to secure a deep penetration. In at least one process the timber is subjected to a preliminary air pressure, preservative is then forced in under a slightly higher pressure, the pressure is then considerably raised and finally, when pressure is released, the compressed air in the wood cells expands and forces out the surplus preservative. In some cases a final vacuum is drawn for the same purpose.

Extracting the Moisture from the Wood

The drier the timber the more easily will the preservative penetrate it, so that wood should be thoroughly air-dry when it is treated. Where it is necessary to treat green, or unseasoned timber, however, direct steaming with saturated steam, followed by vacuum, is resorted to chiefly for the purpose of extracting as much moisture from the wood as possible before treatment. Some important considerations are involved in connection with steaming, into which it is unnecessary to enter here. The use of steam, however, is fraught with considerable danger of serious damage to the timber unless care be taken to employ relatively low temperatures and short steaming periods only. A knowledge of the effect, upon the particular species of timber concerned of steaming for various periods and at various temperatures should be possessed before timber is subjected to steaming. Otherwise serious damage may result.

It will be seen then when variations within a considerable range can be made in temperature, pressure, rate of increase or decrease of these, duration of pressure or temperature periods, vacuum (and the stage or stages of the process at which it can be applied), etc., a very large number of combinations is possible and the details of treatment may vary considerably.

In every case, however, and whatever preservative is used, the object in view is to establish a protective zone of treated timber extending inwards from the surface of the wood to the minimum depth of from $\frac{1}{2}$ to $\frac{3}{4}$ in.

The basic essential requirement then is a fairly deep and uniform penetration. I want to draw special attention to this because in present commercial practice specifications are always based on the injection of so many pounds of preservative per cubic foot of wood. It is well recognized by wood preservers and others familiar with the treatment of timber that this is an extremely unsatisfactory basis. It is true of almost all our timbers that sapwood is more readily penetrable than heartwood of the same species. It is quite obvious then that a pole tie, for example, might conform strictly with a specification calling for the injection of 8 lbs. of creosote oil per cubic foot, and still be very inefficiently treated, because the oil might be practically all in the sapwood, the heartwood exposed on the face of the tie receiving merely a surface coating. Again, penetration may be $\frac{1}{4}$ in. deep in some places, and 1 in. in others. Excellent results are, of course, very frequently obtained in commercial practice, but the fact remains that compliance with the ordinary specification, as is well recognized, does not constitute any guarantee that a tie is properly protected. It may or may not be.

Creosotic Treatment of Railway Ties

What is needed, therefore, is some means by which a uniform penetration of known depth can be ensured in every tie treated. Now I want to guard particularly against exaggeration, but I will venture so far as to say that I believe we have, at our laboratories, approached this desideratum more nearly than has yet been done elsewhere, and that in a very simple, if somewhat revolutionary manner. We completed some year or so ago, in our experimental plant, an investigation of the creosote treatment of Jack-pine and Eastern Hemlock for railway ties. We found hemlock an extremely refractory wood to deal with. In fact, we were unable to secure a satisfactory penetration by any ordinary process, even when the timber was air-dry. By the method developed we were able to secure a satisfactory penetration in air-dry hemlock heartwood with a pressure period of two hours, while air-dry jack-pine heartwood (which we found could be efficiently treated by several processes in commercial use in about two hours) we found could be more efficiently treated in less than one hour when this method was used. The method consisted in producing in the surfaces of the

timber, lengthwise with the grain, incisions of a special character. These incisions are very narrow in proportion to their length, and are so made that the disturbance to the fibres of the timber is very slight, the incisions closing up after treatment so as to be barely noticeable. The timber thus incised was then pressure treated in the ordinary way with creosote. Any other preservative could, of course, be used.

How Theory of Thing Works Out

The theory of the thing is as follows: First there are provided in the outer layers of the timber a number of centres, from each of which the preservative, under the action of the pressure, is simultaneously distributed. These centres (i. e. incisions) are of any reasonable depth desired—say from $\frac{1}{4}$ to $\frac{3}{4}$ in. When the preservative distributed from one centre meets that distributed from adjacent centres the treatment is complete. Wood, however, is much more easily penetrable lengthwise with, than across the grain.

It is necessary to compensate for this feature and this was accomplished by using an incision of the character indicated and thus presenting to the action of the preservative a much larger surface for penetration across than with the grain. The type of incision used has some other special features, which need not be described here.

I should like to go into this matter at length, because there are special features connected with it which do not at first appear. However, I think it can be seen that the depth of the penetration is dependent on the depth of the incisions so that a means of ensuring penetration to the desired depth is provided. Uniformity of penetration is further secured by proper spacing and arrangement of the incisions (which we found to be very important). The time necessary for the preservative distributed from adjacent incisions to meet is affected also by the spacing and arrangement and, of course, by the species and character of the wood also.

Too Little Attention to Timber Study

Although a great deal of attention has been given, and rightly and necessarily given, to the mechanical equipment by means of which preservatives are injected into wood and also to the chemistry of wood preservatives, when we come to the wood itself it is often an entirely different story. There are, of course, notable exceptions, but it is a very frequent occurrence for statements to be made both verbally and in the literature of wood preservation, which appear to indicate that little or no intelligent attention has been given to the study of timber. (Incidentally it is a common error to suppose that timber is gradually being displaced by other materials, and is continually becoming less important economically. On the contrary, the new uses which are constantly being found for wood more than counterbalance the substitution of other materials. The per capita consumption of timber is increasing, not decreasing, and it is fair to state that outside of food products no material is so universally used and so indispensable in human economy as wood. Furthermore it is a material which beyond question can be and is being made very much more valuable to the community at large as a result of the timber research which is always going on). However, to return to my subject—

A well-known engineer in a recent treatise on wood preservation, made a number of statements of the kind I have in mind. In speaking of a certain method of felling oaks he says that it is claimed to improve the timber and to render the sapwood as strong as the heartwood. It has been proved by thousands of careful tests on a number of species that there is no difference in strength between sapwood and heartwood of equal moisture content. The idea that sapwood is weaker than heartwood of the same tree or species is entirely wrong. The same writer, in dealing with the decay of timber, states that under certain circumstances gases are evolved which "enter into combinations and produce fungi." Fungi could, of course, no more be produced thus than could an apple tree, or any other plant.

The Albuminous Matter in Wood

In a booklet issued not long ago, which deals with a certain patented process, there appears a report by a gentleman—whose name I will refrain from quoting, but who is, or was, connected with a well-known institution of learning. This gentleman is careful to explain that timber treatment is a subject to which he has given attention for many years. He concludes his report with the statement that a certain metallic salt protects timber from decay by coagulating the albuminous matter in "the cells of wood and the interstices of the fibres" thus forming a material which is strongly resistant to the action of enzymes and which coats the cell and the fibre surfaces. I wish to draw particular attention to the alleged effect of "coagulating the albuminous matter" in wood, because this expression has been used from time to time in writings on timber preservation for the last 80 years or so, and it is still turning up, like the proverbial bad penny. It is important then to try to ascertain

how much "albuminous matter" there is in wood and where it is to be found.

Albumins are essentially nitrogenous substances. The cellulose complex and the lignin complex, which constitute the bulk of the wood are certainly not albuminous matter, neither are the starches and sugars which are present in relatively small quantity. The dilute solutions of various salts which ascend from the roots to the leaves by way of the sapwood are not albuminous. In short, such materials appear to be of possible occurrence only in those cells of the wood which in life, that is in their functional condition, are characterized by the presence of protoplasm. Elements of this kind exhibit certain distinctive anatomical features and form only a small percentage of the wood. Further, as soon as they cease to function, becoming part of the heartwood, their contents undergo certain chemical changes and, in some cases, actually give rise to antiseptic materials, so that living protoplasm is confined to the sapwood. This being the case the quantity of "albuminous matter" in the average piece of timber is so small as to be entirely negligible, and in any case, does not form an actual part of the wood substance any more than the contents of a box form part of the box. For practical purposes it is not of the slightest significance whether the albuminous matter is coagulated or not since even if it were entirely removed the decay of timber could proceed just the same.

Instances of this kind could be multiplied almost indefinitely, but I think enough has been said to indicate that it is well to pay some attention to the timber itself when dealing with preservative measures.

Company is Held Liable on Notes

A judgment of special commercial interest is contained in a judgment of the Superior Court, rendered recently in Montreal by Mr. Justice Demers, in which the Compagnie Generale l'Entreprises Publiques, Limitee, is condemned on two actions to pay to Paul Galibert a sum of \$20,000, found to be due on notes.

The factum on which the case was presented for adjudication was a voluminous one, and the plea of the defence raised an important point of law respecting the obligations of a principal towards a third party.

The Etienne Dussault Company, Limited, contractors, of Quebec, had a contract with one Gagnon, of Arthabasca, for the supply of lumber for certain works being carried out by Dussault. The contract, which was for \$30,000, was signed "Horace Dussault, president." From time to time the Dussault Company made advances to Gagnon in relation to his contract, giving him notes, which were likewise signed, "Horace Dussault, president." These notes were discounted by Gagnon with Paul Galibert.

It was stated that the Dussault Company knew of the manner in which the contract and the notes were signed by the president, and all notes were duly honored up to the ones at issue in the present action in regard to which contestation was entered on the main plea of change of company and that, according to the by-laws of the company, the president was not authorized to sign alone, but that contracts and notes must be countersigned by Mrs. Dussault.

In 1912, the Dussault Company, by letters-patent, changed their name to the Compagnie Generale d'Entreprises Publique, and after the change Paul Galibert, who did not then know of the change, discounted other notes, which are signed in the same way as the others. It was these, amounting to \$20,000, which the company refused to pay. Hence the present action.

"The question for the court to decide," said Mr. Justice Demers in his judgment recently, "is whether the Compagnie Generale d'Entreprises Publique, the defendants, should be condemned in the two actions for the amount sued for?"

"The court finds (1) that although Horace Dussault had no express mandate to sign these notes he had a tacit mandate; (2) that the change in the name Etienne Dussault Company to the name of the company defendant does not change the liability, as the company is composed of the same persons; (3) that even if the new company (the company defendant) were successors to the Dussault Company, they would still be liable in the light of the law of Article 1728 of the Civil Code, which provides that the principal or his legal representative are responsible towards third parties for all acts made by their mandatory in the execution and within the limits of the mandate after dissolution if the third party did not know of the dissolution. In this instance the plaintiff did not know of the change the company made, and it follows that the article quoted applies. (4) Even if the company defendant advanced too much money to Gagnon, it was through their own imprudence, and it cannot prejudice the holder of the notes in due course.

For these reasons judgment was given for plaintiff for the sum of \$20,000 as claimed in his two actions against the company defendant, with costs. (944 and 3717, S.C.M.)

The first view on the left shows an area repeatedly burned near Madawaska, Ont. This area was once heavily timbered with pine. The next view is that of rocky land near Turriff, Ont., repeatedly burned. It is of no use for agriculture and very little hope for a new forest crop. The thick growth seen in the picture on the right illustrates a dense stand of young white and, red pine of 30 years' growth, located near Mattawa, Ont., which has enjoyed protection from forest fires.

Ontario Timber Survey Making Headway

Roland D. Craig, Forest Engineer, of the Commission of Conservation, Ottawa, who is in charge of the timber survey now being made in the province of Ontario, writes to the "Canada Lumberman" that he and his staff are making satisfactory progress on the survey of the timber resources. They have now practically completed the reconnaissance work for the Ottawa river drainage area. Mr. Craig adds:—Though as yet we have not been able to personally see all the timber owners in this district, those whom we have seen, including most of the large operators, have furnished us with estimates of the timber on their holdings. We have found them anxious to have the survey completed and to make it as reliable as possible in order that reasonably accurate information as to the actual timber situation may be available.

Owing to the fact that many of the licenses were granted for only certain kinds of timber the owners frequently have very little information as to the other kinds not included in their cutting rights. This makes it necessary for us to do more field work than would have been required if they had complete cruises of their holdings. The rapidly increasing value of the hardwoods makes it imperative that we should not overlook them in our estimates. Now that the white pine is being cut off, the spruce, hemlock and even jack pine are becoming important species in regions where formerly they were considered of negligible value.

We find that very extensive areas have been destroyed by fire and that on the whole the reproduction of coniferous species is far from satisfactory from the standpoint of sustained yields. In many areas, however, where fire has been kept out, excellent stands of white and red pine are coming up.

In view of the progressive forest policy in the platform of the United Farmers of Ontario we do not anticipate any change in our co-operative arrangement with the Ontario Government as a result of the change in administration.

New Plant for Making Furnace Fire Brick

Gates Refractories, Ltd., Montreal, are now operating their own plant for the production of furnace fire brick. The plant is at Montreal East, and consists of buildings containing 12,000 feet of floor space. Two large crushers, one dry and one wet, have been installed with the necessary conveyors for carrying the crushed and ground clay from the dry to the wet machine. The storage of the materials and the molding operations are carried out in this department, and to the rear of this building is a drying room, 60 by 60 ft. The floor of this section is of tile, under which the steam piping is located for the drying of the bricks after they come from the molds. The baking and burning kilns are located near the drying room. At present two are in operation, one of 50 tons and one of 60 tons capacity. Two others of 60 tons capacity each will be completed and in operation before the close of the year. The present output of the factory is about 300 tons per month, but this will probably be doubled within the next few months. Efficiency tests have been made at the McGill University on these bricks, and the fusing point has been determined, officially, at approximately 1750 degrees C., or 3200 degrees F. A railway siding is provided at one side of the plant, and there are also facilities for shipping by lake or ocean vessels.

Gates Refractories Ltd. were recently reorganized, with larger capital, in order to extend the business and acquire the factory referred to, so that the company could be in a better position to produce bricks for their own requirements, and in fact, to manufacture all special shaped high grade fire brick for every industrial purpose. The company also specialize on power plant brick-work, such as furnace building and boiler setting, and carry out contracts in all parts of Canada.

Too Much Sawmill Waste Burned Up

Hundreds of tons of sawmill waste which could be used for newsprint and other coarse paper are being burned every day, and there are millions of feet of stumps and small timber in southern cut-over lands which could be used for the same purpose, J. F. Kidd of Lake, Miss., told the annual convention of the Southern Logging association at New Orleans.

"I understand," said Mr. Kidd, "that many small town weekly and semi-weekly newspapers have been forced to suspend publication because of the high cost of newsprint, and even some of the city dailies are having a rocky road to travel, but it seems that there is inefficiency and neglect of opportunity somewhere when raw material is being wasted in quantities with a market crying for the products which could be manufactured from this waste."

He advocated establishment through the southern timber belt of either pulp or paper mills to convert into paper what "now goes up in smoke."

Passing of Mr. Hiram McLean

Hiram McLean died recently in Truro, N.S., from the effects of typhoid fever. He came to Truro in 1900 from Scotsburn, Pictou County, and worked as a master builder on different contracts in Truro. In a few years he branched out into the lumber business and latterly had been associated with his brother-in-law, Mr. Harry McKay, as large lumber manufacturers and dealers, and shipbuilders in Economy and other districts in western Colchester.

This firm had built the large vessels the "Truro Queen" and "Acadian Queen" at Central Economy, and at the present time have another vessel in the stocks, besides extensive lumber operations at Economy and Five Islands; and now from this busy hive the senior partner has been taken away by the hand of death. Mr. McLean, who is survived by his wife, one son and one daughter, was an honorable man and a good citizen.

Sprinkler System Saved Big Factory

Had it not been for the effective sprinkler system, the James Davidson's Sons lumber factory, Wellington and Rochester streets, Ottawa, would have been destroyed by fire recently.

Fire of unknown origin broke out in the ceiling of the factory, but the sprinklers succeeded in confining the flame to narrow limits, it only penetrating the roof. When the firemen arrived, they were confronted with the task of extinguishing a cupola in the roof.

Fire Chief Graham of Ottawa spoke very enthusiastically of the sprinkler system, and stated that if it had not been installed the entire plant would have been destroyed owing to the highly inflammable nature of the material stored in the factory.

Ontario Lumberman Leaves Large Estate

In the will of the late Senator Peter McLaren, lumberman, of Perth, Ont., which has been filed for probate, an estate valued at \$1,092,182.78 is disposed of. Much of the estate is made up of lumbering interests in the Canadian West and timber areas and iron lands in the West, while a large portion, approximately \$100,000, is investments in banks and other stocks.

By the will, to which there are three codicils, the estate is divided among the Senator's widow, two sons, James and William, and three daughters, Kathleen, Margaret Hall and Mary Benedict. To his wife is left his residence, together with twenty-five acres of land, and the income from \$100,000, which on her demise is to pass to her daughters. To his son, William, is left a farm of 600 acres, and to each of the three daughters the sum of \$50,000, together with 15 per cent. of the residuary real estate when sold. The residue of the estate is equally shared by the two sons.

Busy Eastern Lumber Company

The Pontiac Lumber & Pulp Co., whose headquarters are at St. Tite, Que., make a specialty of dressed lumber. Their saw-mill is located at Macamic (Abitibi), Que., and has a sawing capacity of 70,000 ft. a day, while the output of their planing mill is one carload a day. The company cut during a season about 6,000,000 ft.,

Sawmill of Pontiac Lumber and Pulp Co., located at Macamic, Que.

but intend; in the near future, to increase the output to 10,000,000 ft. Their limits are located in the township of Aiguebelle, situated some twenty-eight miles from the mill, and for several years the company have not been obliged to cut much timber on their own lands as they buy a great deal from the farmers in the surrounding country.

The Varnish Tree Grows in China

Varnish is produced in China from a tree commonly spoken of as the varnish tree, but known botanically as *rhus vernicifera*, which is found in abundance in the mountains of Hupeh, Kweichow and Szechwan.

The varnish is taken from the tree after it is about six inches in diameter by tapping at intervals of from five to seven years, until the tree is 50 or 60 years years of age. A good sized tree will yield from five to seven pounds of varnish.

The natural color of the crude varnish as applied is black. It is considered the most indestructible varnish known. One peculiarity is that it hardens only in a moist atmosphere.

Demand for Box Boards in Bristol Market

Canadian Trade Commissioner Norman D. Johnston, of Bristol, Eng., says mention was recently made of the fact that a firm which has obtained their box boards from Sweden would be prepared and would like to buy from Canada, providing Canadian manufacturers can compete in price. This firm is a large branch of a very important concern, and if a Canadian manufacturer can supply their requirements satisfactorily other business would no doubt result. They generally purchase certain box parts which enable them to make up cases of varying sizes. These parts are cut to accurate dimensions, being smooth sawn and are usually formed of two pieces, tongued, grooved, glued, and smooth on one side so as to take a good impression when put through the two-color printing machine. The following specifications were given as indicating a very considerable part of the normal requirements of this firm:—

$23\frac{1}{4} \times 13\frac{1}{2} \times 5/16$ inch.

$23\frac{1}{4} \times 12 \times$ "

$21\frac{7}{8} \times 13\frac{1}{2} \times$ "

$21\frac{7}{8} \times 12 \times$ "

$19\frac{5}{8} \times 8 \times$ "

$17 \times 8\frac{1}{4} \times$ "

They also purchase boards cut to certain lengths, but varying as regards widths. The widths would be from 4-inch upwards in steps of $\frac{1}{2}$ -inch and the size—

$21\frac{7}{8} \times 5/16$ inch

$17 \times$ "

$13 \times 5/8$ inch

$15 \times 5/8$ inch

All the quotations received so far from Canada have been much too high, and in order to give some idea of the prices which would have to be equalled, if not bettered, the following are the Swedish quotations on certain sizes:—

$23\frac{1}{4} \times 13\frac{1}{2} \times 5/16$ —25s. 10d. per 100 pcs., f.o.b., Gothenburg, Sweden.

$21\frac{7}{8} \times 13\frac{1}{2} \times 5/16$ —24s. 0d. " " " " " "

$17 \times 8\frac{1}{4} \times 5/16$ —21s. 3d. " " " " " "

The freight from Gothenburg to this country is about £6 per standard.

Timber in varying widths averaging 5-inch, not tongued and grooved, lengths from 16-inch to $23\frac{1}{4}$ by $5/16$ -inch in thickness, average £30 per standard f.o.b. Gothenburg, while the prices delivered to the works in Bristol average £38 10s. 0d.

The kind of wood usually supplied from Sweden has been white and red fir, but the former is preferred. The timber is usually cut some months previous to shipment and air-dried. It is doubtful whether steam or kiln-dried wood could stand the damp climate of this country. The boards are generally imported in bundles of 25 pieces bound by wire.

If any Canadian firm can compete with these Swedish prices they are asked to communicate with this office.

Scotland Desires Ready-Made Houses

Acting Trade Commissioner J. Forsyth Smith, of Glasgow, Scotland, sends some interesting information to the Department of Trade and Commerce, Ottawa, on the types of ready-made wooden houses which are wanted in Scotland. Mr. Smith says: Considerable interest is being manifested in Scotland in the possibility of securing from Canada ready-made wooden houses to meet the great demand created by the present abnormal shortage in house accommodation, especially for the artisan classes.

The following types are suggested as those for which there would be a considerable demand:—

Two-room house, i.e., one bedroom, one living-room, with scullery, bath-room, cellar and larder.

Three-room house, i.e., two bedrooms, one living-room, with adjuncts as above.

Four-room house, i.e., three bedrooms, one living-room (or two bedrooms, one living-room and one kitchen), with adjuncts as above.

It is considered that delivered prices from £200 to £300 would prove very attractive.

Manufacturers in a position to offer ready-made houses of these or other types are asked to communicate with Mr. Smith.

Paper Mill Ordered to Pay Damages

The strong smell emanating from paper mills has been a long-standing cause of complaint on the part of residents living close to such plants, but never before had a paper manufacturer been called upon to pay damages on this claim.

Such was the occurrence in the civil courts at Three Rivers, Que., where Mr. Willie Cyr of Cap de la Madeleine, Que., claimed \$250 damages from the Wayagamack Pulp & Paper Co., of Three Rivers, Que., which, he said, caused him prejudice in his property, through the bad smell emanating from the plant.

Judge Drouin, after hearing testimony in the case, decided that the plaintiff was entitled to the full amount claimed. The case has an important bearing, owing to the large number of such mills throughout Quebec Province, and the possibility of other identical claims being filed as a consequence of this decision.

Industrial Increase in Saguenay District

Extensive improvements in connection with the pulp and paper industries are being carried out in the Saguenay district, P. Q. Fraser, Brace & Co. are engaged in constructing a dam and other works for the development of a power on the Shipshaw River, which will supply current for a new power mill at Saguenay for Price Bros. The Chicoutimi Pulp Company are adding to their power development of Chicoutimi, not only for power purposes for the ground wood mill, but for extra lighting for the town. J. G. White & Co., New York, are building extensive wharves at Ha! Ha! Bay, which will probably be electrified. At Kenogami, Price Bros. have erected a theatre and club house for the men at a cost of \$50,000.

The Passing of Veteran Engineer

Barnabas F. Ward passed away recently at the age of 81 years. In 1883 he entered the employ of the Waterous Engine Works Co., of Brantford, as travelling engineer and held that position continuously up to the time of his death. Mr. Ward was highly respected by all the customers of the firm and the news of his death will be learned with sincere regret throughout a wide territory. The deceased came originally from Barrie, Ont., and during the early years of his connection with the Waterous Company covered the territory north of Toronto and more latterly looked after the Province of Quebec. Owing to ill health Mr. Ward retired a few years ago to his farm at Highland Grove, Ont.

New Sawmills in Sudbury District

Experiments Being Made in Cutting Up Fire Killed Jack Pine—Increased Logging Output

"Lumberjack" writing to the "Canada Lumberman" from Sudbury, Ont. says: The prospect for a fairly successful season of lumbering is better than a year ago. The supply of men is improving but not up to expectations. They are like migratory birds, constantly on the move and operators are anxiously waiting for them to settle down. Notwithstanding the high rate of wages which are from \$55 to \$70 per month and board, they keep shifting. From present appearances the output of saw logs will be 25 per cent. over last season; railway ties about 15 per cent. greater and pulpwood 10 per cent. On the Canadian National Railway north of Sudbury there is a hive of industry. 75 camps are in operation cutting logs, pulpwood and railway ties, employing some 3,000 men. Two camps are making board timber which is unusual for some years past.

Numerous portable saw mills have been engaged in sawing railway ties from timber too large to make axe ties.

From Mile C. N. R. to Mile 125 there are some 10 tie mills and at Gogama, Laforest and Co. are erecting a mill with a capacity of 40,000 ft. per day.

At Mile 93 Haight & Dickson have erected a fine mill to manufacture timber from their limits.

At mile 96, McCreary and Son have built a good mill and will experiment with fire killed Jack pine. They have 40,000 such logs on skids at this date. If this venture proves profitable it will be a source of revenue to the province and other firms will no doubt follow in cutting Jack pine killed by fire which has been in the past a total loss.

At Mile 125 Tionaga Siding, R. B. Herron & Co. have erected a large mill and are now engaged in sawing. They have three camps cutting logs for next season's cut. Most of the men employed at this point are returned soldiers.

Representative Canadian Lumber Firm

Under this heading "Timber" of London, Eng., in a recent edition, says: Terry & Gordon, of Toronto, are two outstanding representatives of the Transatlantic timber trade. To those in Great Britain who have regard to the wholesale expansion of the wood-goods industry in the Dominion, an introduction of Messrs. Terry & Gordon is superfluous. They are widely known and everywhere appreciated. But for the few who may not enjoy the personal or abstract acquaintance of the popular "T. and G." it may be said that Mr. Terry and Mr. Gordon have been in trade for a considerable period in the East of Canada, doing a large business in East and States Canadian woods. They have extensive offices in Vancouver, and do a huge volume of traffic in British Columbia pine, cedar, etc., in which latter centre of the Canadian lumber world they possess a large, if not the largest, representation.

Terry & Gordon specialize in Eastern woods, including pine and red pine, spruce and hemlock. They are equally interested in Western woods. As an example of push and progress, it may be said that these gentlemen have more than doubled their business within the last few years, and they now desire to effect a worldwide export traffic. To that end they have given their agency in Great Britain to Spencer, Lock & Co., 27, Clements Lane, E.C., who themselves have established a "front rank" reputation in successful trading, and whose connection with Terry & Gordon will make for the good of all concerned.

Associated with Terry & Gordon is Mr. Frank Gordon, who spent some years in charge of the firm's branch at Vancouver, and who is now located at Toronto, where the central depot is situated, and who, it may be mentioned, has been succeeded in the Vancouver branch by Mr. Allan Nicholson. Not less important of the Terry & Gordon branches are the agencies at New York and Montreal, where a growing and influential circle of commerce has been welded. As may be seen from the photographs referred to, Messrs. Terry & Gordon are by no means in the "sere and yellow leaf." They are, however, fully representative of the "Maple Leaf," and as examples of "get on" in contradistinction to "get off," one would have to travel far to find a more fitting combination of ability coupled with experience.

That Terry & Gordon are not "letting the grass grow under their feet" is evidenced by the arrival at Liverpool of three ships, which have been discharging at the Mersey. They are the "Lake Glebe," "Lake Frohna," and "Lake Furlough," from each of which a valuable timber cargo has been satisfactorily transhipped. Another vessel, the "Lake Fibre," is now unloading at the same port of arrival. Further shipments of pine have been arranged for the immediate future, the ports of arrival being Liverpool, Belfast and Glasgow. The s.s. "Scotian" and the m.s. "Holbrook" have

reached the Scottish port, and the "Midmore Head" and "Fanad Head" have been berthed at the Ulster port. Messrs. Terry and Gordon are to be congratulated on the flowing tide of prosperity attending their exports. The trade knows and appreciates their enterprise, and is prepared to meet it half-way. The extension of shipments to the Lagan and the Clyde will be welcomed by Hibernia and Caledonia, the former with a "cead mille failthe," and the latter by the vernacular, "Mon, but it's guide!"

Presentation to Sir James Ball

Sir James Ball, London, Eng.

The Home-Grown Timber Merchants' Advisory Committee of the United Kingdom held a dinner at the Grosvenor Hotel, London, S.W., recently, in honor of Sir James Ball, when they presented him with his portrait in oils, painted by Mr. Stanhope Forbes. Mr. Donald Munro, O. B. E., occupied the chair.

A presentation was made to Sir James Ball by Sir John Maxwell. The portrait bore the following inscription: "Presented by the Home Timber Trade Advisory Committee of the United Kingdom to Sir James Ball as a mark of respect and esteem and in recognition of his successful work as Controller of Timber Supplies during the great war."

In the course of his remarks, Sir John said the perfect chief must have a precise knowledge of the subject with which he is dealing, and devote himself to the problems which came before him. He should see that those who worked with him were the right men, and that they were capable of doing their work, and he should have a real and genuine enthusiasm in his work. Sir James Ball answered all those qualifications. The future of the home-grown timber trade was somewhat uncertain, and one of the most important uncertainties was the question of transport.

Sir James Ball, in reply, said that, with the exception of the general engineer's knowledge of how to use timber, he came into the work without any special qualification. There were two sides to the timber control—the home timber trade and the imported timber trade—but he always looked upon the home timber trade as the more difficult of the two. They were cut off from imported timber, and had to rely upon the home-grown trade. In less than twelve months they got to work with the right men at the head of affairs, with the result that they more than doubled their output. He should look upon the portrait as one of the greatest gifts he had ever received, and it would be treasured by his family long after he had passed away.

Mr. Horton presented a silver rose bowl to Mr. Calder, which bore the following inscription: "Presented to James W. Calder, Esq., Acting Controller of Timber Supplies, by the members of the Home-Grown Timber Trade Advisory Committee as a token of esteem and regard, and in recognition of valuable services rendered during the great war."

Last of Timber Limits Disposed Of

The last of the McMullen timber limits has just been sold to Ernest Chisholm, owner of the Kempton Mines, and H. McK. McCallum, Truro, N. S. These lands consist of fifty-five hundred acres of virgin timber three miles from Mulgrave and one mile from railway, and are estimated to contain over twenty million feet of merchantable timber. These lands holdings, combined with the present contiguous holdings of Chisholm and McCallum, make one solid block of ten thousand acres, one of the largest single timber lots in Nova Scotia. T. G. McMullen was at one time the lumber king of Nova Scotia, and since his retirement from active business has thus finished selling his entire holdings of over three hundred thousand acres.

Link-Belt Co. of Chicago, Ill., are completing a new addition to their Belmont factory at Indianapolis. The extension consists in completing their new furnace buildings Nos. 7 and 8, but for the present the company will install only furnace No. 7, which will be fifteen-ton capacity instead of ten-ton like the present furnaces. The company are also purchasing the necessary machinery such as rolling mills, sand blast and other foundry equipment.

Breezy Paragraphs from the East

William Murray & Sons of York Mills, N. B., have purchased a piece of property near Hervey Station for the purpose of erecting a planing mill in the spring. They have also purchased the Swan saw-mill at Tweedside and intend to manufacture lumber and shingles there.

Although the highest wages ever in the history of lumbering in New Brunswick are being paid, operators report that men are scarce, except on the North Shore. As high as \$70 per month is being paid to lumbermen and in some cases \$125 and even \$150 per month is being offered to cooks to take charge of large camps.

A saw mill and box factory, owned and operated by Moirs Limited, was destroyed by fire on November 14. The buildings, which were fully equipped with modern machinery, were insured for \$50,000. An estimate of the loss exceeds this amount. Fire apparatus was dispatched from Halifax, but arrived too late to save the buildings, although they prevented the blaze from spreading to the large lumber piles.

The Nashwaak Pulp & Paper Company have concluded the purchase of a new pulp and paper mill site at South Devon, N. B. The property consists of twenty acres located near the mouth of the Nashwaak river and is tapped by both the Canadian National and Canadian Pacific railways. Hon. N. M. Jones, managing director of the company, says he is not as yet in a position to make any announcement concerning the erection of a pulp mill.

Shipping is beginning to pick up at this port and already large lumber shipments are being recorded. The C. P. O. S. liner Batsford sailed from St. John, November 21, with a large cargo of deals for Browhead, Ireland, for orders. The S. S. Cape Premier, another large liner, is now in port, loading lumber for Stetson, Cutler & Company. The schooner Abbie C. Stubbs recently sailed for Bridgetown, British West Indies, with 337,633 feet of pine boards, valued at \$13,505.32.

Announcement was made that the sale of stumpage on the Christie Murray property in the upper end of the parish of Dumfries, York County, has been completed. The property consists of 450 acres land, on which it has been estimated that there are over two and a half million feet of spruce, as well as more than three-quarters of a million feet of birch and maple, the purchaser having until 1924 to remove the lumber. The purchaser is Henry Swim of Doaktown, who secured the lumber for \$23,000.

An unusual large cut of lumber, as previously predicted, is expected in New Brunswick this winter, according to an announcement of Col. T. G. Loggie, Deputy Minister of Lands and Mines. If the snow fall is not too heavy the cut may be the largest on record. On the area in which the spruce bud worm did so much damage this summer a great deal of the lumber will be lost as it will be impossible to spare the time to cut it. Most of the spruce, which was destroyed, is of an inferior quality, while the pest did its greatest work of destruction to the balsam fir.

The large corporation drive on the St. John river reached the booms in Fredericton recently and the crews were paid off. Old-time river men say that this was the latest date for the drive to reach the booms in thirty years. At that time the drive was in charge of Walter Jackson, who is now manager of the St. John Log Driving Company, who was also in charge of this drive. In spite of the late arrival of the corporation drive the St. John River Log Driving Company, by carrying on rafting operations until November 3 have cleaned up the supply of logs so that only between one and two million feet will be carried over winter in the booms.

Newsy Briefs from the West

The B. C. Fir and Cedar Lumber Company, which had its plant wiped out by fire some weeks ago, has announced the decision to reconstruct. The new plant will have a nine-hour capacity of 75,000'.

It is reported that the Dominion Government plans to place contracts for fifty schooners with British Columbia shipyards. According to report 25 of the ships will be constructed at Victoria and the other half will be turned out by yards on the mainland.

Prices of lumber in Vancouver were raised recently \$2 per thousand in all classes. Lumbermen are looking for higher prices in the spring. It is freely predicted that there will be a jump of from ten to eleven dollars before April because of the unprecedented demand for lumber from all parts of the United States.

The Forest Mills, Ltd., have let logging contracts on the Kettle River, B.C., and work has already been commenced and will be continued all winter. It is expected the company's big mill at Cascade will commence sawing in April. It will have a capacity of 85,000 feet per day, and give steady employment to 75 men.

Frank Buckley, manager of an extensive lumber and logging plant at Buckley, B. C., on Massett Inlet, Queen Charlotte Island, is

on his way back from England, with, it is understood, sufficient capital to carry out large developments. Much of his holdings contain spruce, and it is believed the manufacture of wood pulp will be part of the new undertakings.

A federal charter has been granted the Western Spruce & Cedar Co., Ltd., with a capital stock of \$100,000 and headquarters in Vancouver, to carry on the business of timber merchants, sawmill, shingle mill and pulp mill proprietors, loggers, etc. The incorporators are Thomas T. Howland, of Minneapolis, Minn., Wm. E. Burns, Robert K. Walkem and George J. Thomson, of Vancouver.

The lumber mills in the district of Langley, B. C., are keeping very busy, although experiencing a shortage of cars. Rennie's mill at War Hoop is operating steadily. A large number of ties are being taken out and also shingle bolts, which is a source of revenue to the farmers. Altogether the prosperity of the Fraser Valley is considerably enhanced by the active logging operations throughout all wooded sections along the B. C. E. Railway.

An informal dinner was held recently in Vancouver by the B. C. Loggers' Association, who were the hosts of the B. C. lumber merchants. About one hundred attended the function, F. C. Riley, of the firm of Bloedel, Stewart & Welch, President of the Association, presided, and was assisted by W. B. W. Armstrong, Secretary of the Loggers' Association. Various topics of interest were discussed and the get-together movement was given considerable impetus. Many expressions were voiced on the need of a spirit of co-operation.

A whirlwind of buying, both domestic and export, to the United States, of lumber through the west has advanced the wholesale price of lumber from five to seven dollars per thousand, according to recent advices from Winnipeg. American buyers are held chiefly responsible. Even common lumber base price is now wholesale at mills \$42.30 per M with a spread of at least seven dollars. Previously it was three dollars below list price. Many large dealers have been caught, having sold hundreds of cars at list price two weeks ago without getting their orders for delivery accepted by Pacific Coast mills.

Mechanics' Lien Act Will be Revised

It will be good news to retail lumbermen and others to learn that the new Ontario Government intends making certain revisions to the Mechanics and Wage Earners Lien Act which move has been urged by the Ontario Retail Lumber Dealers' Association for some time. At the last session of the Ontario Legislature, a committee of the House was appointed to undertake the work of revision and, if thought advisable, to bring in an entirely new act as the present one is obsolete and defective in many respects. Many members of that committee were defeated at the polls but it is understood that the work will go on. Hon. Walter Rollo, Minister of Labor, has announced this fact but until the international labor convention at Washington is over and a consultation has been held with Dr. Riddell of the Trades and Labor Department, it is impossible to give out the details of procedure.

Death of Veteran Yardman

Walter Beatty, a resident of Pembroke, Ont., for 56 years and a former Mayor of that town, died recently. He was born in the township of Young, County of Leeds, twelve miles from the present city of Brockville in 1841, and was educated there, going afterwards to Pakenham. From there he came to Pembroke to enter the employ of the late Lawrence Naismith. He proved himself so efficient that in 1871 Mr. Naismith took him as a partner in his planing mill and contracting business. Upon Mr. Naismith's death Mr. Beatty took over the business himself, and it has flourished under his proprietorship until now it is one of the largest of its kind in the Ottawa Valley. Many large carpentering contracts will be memorials to Mr. Beatty for his field in that capacity was large. He had contracts on the Post Office, the Presbyterian Church, the General Hospital, the West Ward School, the Bishop's Palace, and many more of the larger buildings in town.

Mr. Beatty took great pride in the fact that he was active at his advanced years and it was inspiring to see a man of 78 working so hard and moving about so quickly. A few years ago there was a banquet given in Pembroke to all the old men who had been in business in Pembroke for 50 years or more. Mr. Beatty was there.

Work has been commenced on a very extensive match splint factory at Berthierville, P.Q., for the Log Supply Company. The cost is estimated at about \$2,000,000. The factory will comprise a log haul and machine shop, boiler house, and masher house, and will be 533 x 320 feet. The building will have a concrete foundation, and will be constructed of steel and brick. The engineers and contractors are the Austin Co., New York.

Many Coast Logging Camps Shut Down

That shipbuilding operations at Prince Rupert are going ahead full blast with the prospects of the continuation of activities for some time to come, was the impression which N. S. Loughheed, of the Abernethy & Loughheed Lumber Co., who returned recently to Vancouver from an inspection trip in the north, received when he visited the northern town.

"The keel for the second steamer for the Canadian Government was laid a few days ago," explained Mr. Loughheed, "and it looks as if the industry will have smooth sailing for the next few months. Several hundred men are being given employment and the industry means a great deal to Prince Rupert."

Mr. Loughheed was questioned as to the logging industry along the coast, especially with regard to the campaign to root out the I.W.W. element in the logging camps. He explained that practically all the camps have been shut down, a few are being operated at the present time and in these the I.W.W. element is being reduced to a minimum. No trouble, he believed, was being experienced now with this element, although he only visited one camp on his trip and could not speak authoritatively.

As far as his concern is concerned, Mr. Loughheed explained, the operations were confined to cleaning up the surplus stock of logs which were cut for the Imperial Munitions Board order. These, of course, are being handled through Prince Rupert. He did not visit Vancouver Island, but stated that one big camp was being operated, that being the Kelly camp. He anticipated much activity in the logging industry on the Island during the next few years. He visited Ocean Falls but all camps are shut down in that vicinity.

Another well-known lumberman who returned recently to Vancouver is A. B. Martin, of the Pacific Mills, Ltd. He was as far north as Ocean Falls. He states that the outlook for the logging business next year is exceptionally bright.

Many Opportunities for Work in Bush

Latest reports from all employment offices of the information and service branch of the Department of Soldiers' Civil Re-Establishment, Ottawa, show there is considerable opportunity for employment for large numbers of men, in the bush, at mining and lumber centres. During last week, 2,505 ex-members of the forces were found employment. This brings the total placements to date to 95,819, being 95.1 per cent. of the applications made to the Information and Service branch. In the lumber camps better meals and accommodations are being provided for the workers than in the past years, and wages are high. Nova Scotia and New Brunswick are asking for men for outdoor work. Returned men who are skilled workers would find opportunities throughout Ontario, particularly in Kitchener, where the factories are reported to be short in their output owing to lack of sufficient workers.

Wilful Waste in Logging Methods

Major A. Barclay, of Montreal, a civil engineer, who went down the North Shore of the St. Lawrence accompanied by Mr. W. D. Sweezy, of Quebec, in the beginning of September last to explore the country inland from Matane, Que., for Ontario capitalists interested in the pulp and paper business, returned recently. Major Barclay stated that his principals were anxious to learn the value and condition of the forest properties in the section that he visited. He said that the pulp and paper business was destined to become an important industry in the Province, and that it would eventually assume large proportions.

Relating his experience during his trip of exploration, Major Barclay said: Mr. Sweezy and myself went down the river as far as Matane, and from north of that point went into the woods. In our tour of exploration we covered nearly 2,000 square miles of ground. Shortly after we started on our tour the weather became cold and

the lakes froze over, so that we had to abandon our canoe and continue our work on foot.

It is an immense silent country; even the birds that flit from tree to tree do so noiselessly. The only sound is the roar of the water-falls. The country is rich in its water powers, large streams with high falls, that find their way into the St. Lawrence, from the height of land 300 miles from the shore.

We came across a tremendous lot of birch, as well as spruce, cedar and Jack-pine. We saw no fur-bearing animals, but came across their tracks. As for flies, all I can say is that it is an ideal country for them.

We travelled past magnificent spots for the establishment of villages, and found trees of great age, among them black spruce fully 200 years old. Timber we met with in other sections showed age from 80 to 90 years, which went to demonstrate that this part of the country had been swept by fire and the growth of timber all destroyed.

Major Barclay spoke in severe terms of the manner in which logging has been carried on in that country by the jobber, who only thought of the easy dollars he was making, and who carried on a destruction that the Government should not allow. He said: "Everywhere we went in close proximity to the river, we saw signs of wilful destruction in the manner in which logging has been carried on by the jobber. We came to numerous places where trees had been cut near the shore, or in other places near an easy road to haul the logs to the river. A jump had then been made to other sections where the work of logging could be carried on as easily as possible, while timber in small areas more difficult to reach was left, and thus the cutting commercially ruined. As a matter of course the further you have to go after the timber the greater the expense, and when the shore timber is depleted and the jobber called to go further inland, he is compelled to ask a higher price for his product. On the other hand, if he cut the timber as he reached it, without making a choice in his cut, he would preserve the material instead of carrying on uncalled for destruction.

There is another feature connected with careless logging that the Government should see to and arrest. That is the conditions created by the loggers who pick out their cuts from easy pockets, and allow an accumulation of brush to catch fire, burning down miles and miles of valuable timber. These timber limits are filled with Indian and French-Canadian trappers after fur-bearing animals, who make their camp near such brush, and, in my opinion, are responsible for many of the forest fires that take place. We came into contact with a great many such traps on our tour of exploration that indicated the large number of trappers who crowded into the woods after the fur-bearing animals.

Major Barclay said it was the same old story of neglect on the part of the Government not to learn the importance of the country's forest resources and its protection. This thing was not alone confined to the Province of Quebec, it existed in Ontario and in British Columbia. To his mind it was like wild-catting in gold mines.

"As it is," said Major Barclay, "it is a great waste, throwing away the 95 per cent. of the cut for the sake of getting the remaining 5 per cent., that costs the least money to produce. We came across a fine lot of timber, and if the areas worked very properly cleared, you would get the hunters off and then secure better fire protection. It is a great country in its wealth of timber and its enormous water powers. I am not finished with my exploration and am coming back again to continue the work."

In view of the tone of the inquiries from France and the United Kingdom for timber, the Pacific Coast lumber interests expect to ship huge quantities during 1910 and 1920, according to G. Loken, manager for G. W. McNear, Inc., the well-known San Francisco house, and junior member of that firm. Mr. Loken, who is now in New York, stated that one French inquiry had been for 60,000,000 lineal feet, and that Great Britain and Italy also indicated that they would depend upon the Pacific Coast for building materials to be used in reconstruction work.

Truck Took Eight Tons up Steep Hill

Some of the controllers and aldermen recently saw a demonstration of the work of the National Steel Car Company, of Hamilton, Ont. They went to the Beach filtering basins and saw the truck haul three tons of sand from the lake shore. The sand over which it was hauled was very heavy and wet and the truck sank deeply into it, requiring some digging. On the hard road the truck made fine time. The best test was, however, on the mountain side. The truck took an empty wagon up to the quarry chutes, where over three tons of stone were loaded on the wagon and four and a half tons on the truck. This great load was taken up the steep Jolley Cut as easily as a horse would draw an empty wagon. Stops were made at the steepest places and the start made again without the slightest sign of an effort.

The City Engineer of Hamilton is asking the Works Department to buy a truck, believing that it will make a large saving in the cost of hauling sand, stone, drawing a string of garbage wagons and doing other heavy work.

Pulp Company Buys Big Acreage

An announcement is made that the Nashwaak Pulp and Paper Company have bought twenty acres of land at South Devon from Albert J. Myles, paying \$250 per acre. The land is located at the mouth of the Nashwaak River, opposite Fredericton, and it is believed it will be utilized for erection of a large pulp and paper plant in accordance with the company's announced intention of removing their main plant nearer to the source of supply of raw materials. The company own the Gibson lumber land on the Nashwaak River.

Gillies New Mill Will Be "Last Word"

The construction of a sawmill of reinforced concrete has been begun by the lumber firm of Gillies Bros., Limited, Braeside, Ont. The mill, which will have a length of 190 feet and a depth of 73 feet, and look out on the Ottawa River, is to replace one of large capacity destroyed by fire on June 23 last. With three double-cut bandsaws and a resaw, the new mill is to be one of even greater capacity than the

old one. All of the machinery is to be electrically driven. A. F. Byers & Co., engineers and contractors, of Montreal, have the work in hand and are to finish it on or about May 1 next. The township of McNab has been asked by the company for a fixed assessment of \$80,000 for a period of ten years. The new mill will represent the last word in sawmill construction.

Western Lumberman Speaks in Montreal

Mr. L. A. Guertin, of Vancouver, B.C., was the speaker of the afternoon at a recent meeting of the Chambre de Commerce, in Montreal, and as a youthful French-Canadian who has distinctly made good in a western province, he was given a hearty reception by the Montreal body of French-Canadian business men. Mr. Guertin, who was introduced by Mr. A. Lemont, of Le Canada, migrated to the province of British Columbia from Quebec fourteen years ago and is now the head of one of the large lumber manufacturing concerns of the western province. Although for so many years out of touch with his native tongue, he made his address in French, and, despite his own modestly expressed doubts, showed that he had forgotten little of the language of his fathers.

Mr. Guertin's plea was for the development of closer trade relations between the province of his birth and the one which he has chosen for his life's work. He pointed to the fact that Americans control nearly all of the western trade, the possibilities of which, he said, apparently have been overlooked by the eastern part of Canada. He spoke at some length of the natural resources of the west, particularly those of British Columbia, of timber, fruit, mineral and general agricultural and manufacturing possibilities, which are already opened up and which await only capital for development.

PINE, SPRUCE or HARDWOOD LUMBER

To the Mill Man—I'm always in the market for Lumber, Shingles and Lath.
Please mail lists of your stock.

The following limits are offered for sale. Cruiser's Reports and blueprints where available will be sent to Principals or their accredited Agents:—

British Columbia, Prince Rupert District:—

160 acres freehold within ¾ mile of Skeena City on the Grand Trunk Pacific Ry. Estimated stand 5,000,000 bd. ft. within a few miles of Prince Rupert.

British Columbia R. R. Belt:—

Estimated stand approximately 300 million bd. ft. Capacity of mill 60,000 bd. ft. per day. The plant is on the main line of the C. P. R. and logs can be driven into the millpond at a minimum cost.

Quebec, Bonaventure County:

A Crownland limit of 4 sq. miles, estimated at 20,000 cords of Spruce and Fir is offered for sale. This limit is on Metapedia waters with a driving distance into the Metapedia, just above the Metapedia boom, of about 25 miles. The limit is about 14 miles from a station on the Intercolonial Ry. and the settlement extends back to within 3 or 4 miles of the northern boundary. Logs can be landed on a drivable stream for \$10.00 per M. bd. ft. and can be driven into the Metapedia boom for about \$2.00 per M. There should be a minimum profit in operating this tract of \$40,000.

Ontario, McMahon Township:

36 sq. miles of Crownland, stand estimated at 50,000,000 bd. ft. with 140,000 cords additional. Extensive tracts of timberlands for sale in all parts of Canada and Newfoundland. List your properties with us for quick results.

Review of Current Trade Conditions

Ontario and the East

Every wholesaler is discussing a shortage of stocks at the present time, and mentally speculating where supplies are going to come from for meeting next year's large requirements. There is not a wholesaler or a manufacturer who has not very much less lumber on hand at the present time than was on stock at this particular period last year, and in not a few instances production was considerably increased during the past operating season. A number are wondering how they are going to bridge the chasm between now and next May, until which time practically no new stock will come on the market. Prices in all lines are holding very firm and it seems to be the prevailing opinion that advances from \$5.00 to \$10.00 per M will be placed on hemlock and white pine by the producers when seeking to dispose of next year's cut. There is a great shortage in all supplies of hardwood and quotations are advancing all the while. In fact they are soaring amazingly. The automobile industry has been one of the heaviest buyers of Eastern hardwood, and practically all the large makers of cars across the border have bought from Canadian lumber merchants.

The domestic demand for lumber of all kinds has been very active during the past season owing to the extent of house building campaign in various cities and the large amount of repair work carried on. Now many farmers are undertaking to complete alterations to their buildings, which has created good business for the rural retail lumberman in various centres. On top of this there has been a good demand from American consumers for the major portion of the year, which has caused the past season to be one that will be remembered, on the whole, as being one of the most active and satisfactory since the outbreak of the war. November and December are generally comparatively quiet months in wholesale and manufacturing circles.

Practically all sawmills have now closed down for the season, a couple of the largest in Ontario operating until December 1st.

The B. C. market is growing firmer all the time and prices show a tendency to advance. There is also a sharp demand in the West for dressed and rough timbers, and more orders are on the books of most firms for all kinds than there have been for a long while. Timbers cannot be shipped East without considerable delay, owing to the car shortage. Many Coast mills report more inquiries for lumber now than they received last June when the demand was supposed to be at the highest point. 1, 1½ and 2 in. rough clears are very scarce; in fact the upper grades of all lines of fir are limited in quantity at the present time. To use the expression of Eastern representatives British Columbia firms' stocks on the Coast are all "shot to pieces." There are certain odds and ends that may be secured and these are coming through fairly well considering the difficulty in securing cars of which all the Western plants are complaining.

Hardwood flooring firms are very busy and woodworking plants are for the most part rushed with business. Many flooring firms have been offered export trade in large volume, but their sales at home have been so large that they have no offerings for shipment abroad.

There is a scarcity of 2' x 4' and 1½' x 10' white pine. Hemlock is also exceedingly shy and the outlook for any measure of relief is not reassuring. Lath are practically unobtainable and command any figure desired. Then, those who have a stock, do not sell in large quantities and will only give a retail dealer one-third or one-quarter of a car on condition that he purchase enough lumber to make a carload shipment of material; in other words, lath are being used as a bait for the disposal of other products and are not to be secured in the open market.

It is reported that a bank, which had made a seizure of some effects of an Eastern lumber concern, sold nine carloads of No. 1 spruce lath recently at \$9.50 per M., f.o.b. mill.

Indications at the present time point to a very heavy cut of lumber in New Brunswick during the winter. The cut will be heavy on both Crown Lands and privately owned lands.

The decision to cut more lumber is said to be the result of prospects in the world-market that there will be a tremendous demand for lumber next year. France and Belgium are expected to have heavy requirements for reconstruction and the United States and British markets also are expected to be under-supplied.

During the past season of navigation there has been a steady movement of manufactured lumber overseas from various New Brunswick ports but scarcity of shipping retarded that movement

to quite an extent. The shipping situation will gradually improve, and the expectation is that the huge quantities of manufactured lumber, which has been piled on the millyards all over the province, some of it for more than one season, will be cleared in 1920, with much of the coming season's cut in addition.

Logging operations and the available supply of men are referred to pretty fully in another column of this issue. The fact that the I.W.W. men and the Bolsheviks have made their appearance in Canadian camps calls for the most thorough action, not only in seeing that these clandestine visitors are summarily treated, but also to drive home the fact that eternal vigilance is the price of safety. These gentry are receiving a short shrift in American logging centres, and while they have not grown as bold on this side of the line as in the West, still enough has been seen of their actions and the course they pursue, to earn for them long terms of imprisonment.

United States

General reports from leading centres indicate no particular change in the situation so far as production and demand are concerned. Building activity is naturally falling off and trade slackening down at some centres. However, prices are holding their own and any quietness is seasonal and naturally to be expected as the result of labor troubles, the coal strike, car shortage and other factors which have to be contended with.

In the hardwood market furniture manufacturers continue to take about 60 per cent. of the entire output and quotations are held firmly. Stocks are decreasing all the time and logging operations are interfered with in many centres owing to the excessively wet weather. Box makers are taking about 11 per cent. of the hardwood output, leaving little for the many other concerns. Vehicle firms are also buying quite freely.

Some improvement is seen in regard to the conditions surrounding the Southern Pine. Buyers are more frequently around mills and more sales have taken place during the last few days than for some time past, with advances on certain lines. There are also quite a number of inquiries which is a healthy sign of future activity.

There seems to be no doubt in anybody's mind now that the country will do a great deal of building next year, and the retailers are gradually realizing that it is up to them to get ready for business early, in view of the present stock prospects. There is a very fair demand for finish, but it is practically off the market. With the exception of 2-inch, which seems to have a temporary recession, dimension and timbers are developing great activity in the domestic market, but more particularly in the export field, with large orders for Cuban and South American delivery. In fact, the export business apparently is beginning to materialize more satisfactorily now; prospects at least are much better. Several buyers from Spain, Italy and Great Britain are reported on their way to the United States to negotiate for supplies. Interior shipments are very slow, due to the unsatisfactory car supply.

A very active season is in progress for Douglas Fir and the market has gained considerable strength during the past few days with the result that prices have stiffened. What is taken by lumbermen as an indication that the railroads finally are about to resume their lumber buying is an inquiry for 10,000,000 feet, mostly of car siding, being circulated among the north-western mills by the Northern Pacific Railroad. The railroads, it is believed, will require tremendous amounts of lumber to rehabilitate their lines and equipment after this long period of neglect, and their re-entering the market naturally will be a factor of great force. The Douglas fir mills of Washington and Oregon continue to operate at nearly capacity basis, the production of 125 mills reporting to the West Coast Lumbermen's Association during the week ended Nov. 8 being within 6 per cent. of normal. But the car situation continues such as to interfere seriously with shipments, and there is no definite prospect of relief. That buying has been begun in earnest may be noted from the fact that reports to the association show orders in excess of production.

Some interesting information is forthcoming in regard to the market at Buffalo when it is stated that several sensational advances have taken place during the past week. The principal increases have been on gum and elm, spruce and hemlock. Lath are practically off the market and Canadian birch prices are regarded as the highest ever known. Buffalo lumbermen complain of an extra shortage of cars. It was reported some time ago that 44,000 Canadian cars were in continued use on the U. S. side of the line. The

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited
SARNIA, ONTARIO

B. P. BOLE, Pres. F. H. GOFF, Vice-Pres. E. C. BARRE, Gen. Mgr. W. A. SAURWEIN, Ass't. Mgr.

matter has been taken up with Washington to see if an adjustment can be made. Lumbermen say it is almost impossible to get cars from New Brunswick and other spruce and cedar districts of Canada.

Great Britain

There has been no particular change in general business conditions during the past fortnight. There is a moderate amount of selling with the demand improving slightly in nearly all parts of the country. A recent report issued by a leading firm shows that stocks of spruce, birch logs and birch planks were higher at Manchester and Liverpool during October than for any similar month during the past three years. The imports of New Brunswick and Nova Scotia spruce and pine at Liverpool was 5,000 stds. during the past month, while consumption was over 3,000 stds., and the stock on hand, 16,000 stds. In Manchester spruce imports were 2,540 stds. with a consumption of 1,410 stds., leaving 11,000 stds. in stock. The combined stock of birch planks at Manchester and Liverpool at the present time is 982 stds.

In regard to the progress of 1920's selling, the "Timber Trade Journal," in a recent issue, says: The 1920 season is opening in a very spasmodic and uncertain manner. Holland made a few early contracts, then the English merchants started, and we now hear that Spain and France, and also Belgium, have taken the plunge. The first sales were concluded at about £2 advance on this year's figures, or on the basis of about £27 for 3 x 9, £25 for 7-in., and so on, and the sellers' ideas have since advanced. It was all along anticipated that 11-in. would be much dearer next year, and every fresh sale confirms this view. Lower Gulf 3 x 11-in. unassorted red have fetched £35 f.o.b.; for 3 x 9 the price to Spain is £30; for 8-in., £28; and for 7-in. battens, £27. In the French market prices appear to be even higher, but the sales are made in kronor. 3 x 9 3rds have made 540 kronor. In spite of all objections which may be raised, we still think that if English firms can obtain good lines of 9-in. and 11-in., they cannot possibly lose by buying in advance. The world supplies must for at least a couple of seasons be short, and firms who do not secure their stocks early will find that there are none left to purchase at any price.

In regard to general business for next open water, it is most difficult to give any opinion as long as uncertainty rules regarding the disposal of Government stocks. Whatever policy is adopted, however, we do not see how the authorities on this side can force

down the prices of the Swedish shippers. In the first place, the sellers are not profiteering—the cost of production is enormous; and, in the second place, the demand will so greatly exceed the supply that the British Government's stocks will be absorbed without difficulty, and the market will still be hungry for further goods.

There are also important changes in the method of doing business, and the following outline will be read with considerable interest, particularly by Canadian exporters: It is hard for old-fashioned timber firms, accustomed as they have been for years to regular business, to realize that changes are in the air, and that we may not return again altogether to pre-war methods. The bonds, however, have been loosened, and trading is now carried on in a much more haphazard way. The Federation—rather a conservative body—is doing its utmost to make sharp distinctions, and by strict definitions of importers and retailers to prevent any overlapping between different sections of the trade. At the same time there have lately been bitter complaints that many of the agents are not playing the game. A tendency has arisen among London firms to appoint sub-agents in different ports, and instead of the leading London firms selling merely to one or two large importers at the chief ports, they get their sub-agents to call on the merchants who can purchase 100 standards or so, and to sell to these firms direct. We believe the changes which are now taking place are due in a great measure to the revolutionary rationing scheme instituted by the Controller in July, 1918. On that date, by a stroke of the pen, importers, merchants, and even retailers, were all reduced to the same level, and could purchase from the same source. It would be strange if the trade could survive such an experience, and not feel its effects. The transition stage, however, is very unsettling. If agents are going to sell to the smaller firms, how is the importer to exist? He has to run great risks, he must have command of a large capital, and yet he is in no better position than the merchant who purchases a tenth of the quantity. In what way the situation will develop is very uncertain. There are at the present time, for instance, negotiations proceeding abroad for the amalgamation of exporting firms with the idea of opening up offices in this country; and there are also, further combinations among importers for the purpose of making extensive purchases and controlling the market. In spite of all efforts to preserve the old fabric of the trade, changes seem to be inevitable, and new firms with progressive ideas will have opportunities for business on fresh lines.

SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD

Prices Firm and Outlook Good at Ottawa

Continued firm prices, and a slackened demand as compared with the months of September and October, with a general shortage of high grade stock throughout the Valley, and the prospect of good business being ahead, combined to make the Ottawa lumber market for November, an unusual one in a variety of ways.

The market all around showed strength, both as to firmness of price and as to the outlook for future business. In all branches of the trade hopefulness was expressed. It was generally agreed that the market for the first time since 1914, was rapidly readjusting itself to its pre-war standard. One exception to this, however, was the shortage of high grade stock, which with some of the big companies was practically off the market.

With stocks low, it was expected that with the present and coming demand, prices are going to go up. The "Canada Lumberman" has been reliably advised that stocks in practically all grades will take at least one, if not more, upward jumps in price before the spring months.

A great revival of building activity, equalling if it does not surpass that of the pre-war years, is looked forward to. Already there are signs of it being reflected by the real estate market, and the housing situation at the Capital. It is not expected that any great amount of new building will be commenced during the winter months, but, rather that plans and preparations will be made, for the commencement of a great volume of it in the spring. The expected building boom will include commercial as well as residential buildings.

Shingles and lath, in company with the higher grades of stock, also went off the market with some firms and companies. The stocks of these two building staples were not large at any time during the fall months. The demand of late for them has been such as to about wipe out any stocks there were. Another factor that lent strength to the market were the reports from woodworking plants,

which indicated that they already had enough orders on their books to keep them busy until Christmas or the new year. After existing orders have been filled, the indications are that more will be readily forthcoming, and the factories, according to present signs, are assured of a good business during the winter. The demand for sash and doors increased and plants manufacturing them were kept busy.

Orders especially for export, as was to be expected considering the period of the year, fell off a little. On the other hand inquiries were as numerous if not more so than in October. The principal orders and inquiries came from the United States yards. They were chiefly for the lower grade stocks.

The export situation to England and European ports practically closed down for the year, owing to the port of Montreal closing up. With the exporters, it was taken that the majority of the pine stocks purchased by Sir James Ball, the British Timber Controller, during his visit to Canada, had been shipped. The spruce stocks purchased at the same time, are not yet all across the water. It is expected that some shipments of these will be undertaken during the winter months from the ports of St. John and Halifax.

The outlook toward the purchase and shipment of stocks to the English market for delivery next year, was unsettled. Several important factors exist in this trade. The primary one is the question of ocean freight rates. During the past season Ottawa firms shipping to England had to pay an ocean rate from \$36 to \$38 per M. feet of lumber, or as judged from the St. Petersburg "standard"—i.e., 1980 feet, about \$72 per standard for 2 inch and thicker, and \$78 per standard for shipments of inch up to two inch. The question with the exporters now is whether or not the same ocean rates will prevail when shipping opens up next April or May? Shippers believe there is reason for the rates coming down. Another question is what the International rate of exchange will be next spring. The general belief was expressed by exporters that prices would

HALIFAX, SYDNEY, N. S. ST. JOHN, N. B.

continue to remain high in the Old Country, largely due to the demand and the shortage of stocks in the Ottawa Valley.

The situation regarding labor for the woods camps remained about the same as it had been. The camps of the Ottawa Valley operators taken all around were not as well filled as some of the operators expected they would have been. Two of the chief difficulties confronting the operators is the still marked deficiency in the quality of woods labor and the ever present problem of transients. Several operators openly state that the relief in the woods labor situation, which was expected to come about through the return of members of the overseas forestry corps, had not shown itself. Some members of this branch of the trade, declare that the members of the forestry corps returning from overseas seemed content to live on their gratuity money rather than go to the bush. Again there was a fairly large percentage of them that took the Governmental vocational training courses, which prevents them from going back to their old occupations as bushmen.

Taken all around, though the operators' plans included the getting out of a fifty or sixty per cent. bigger log output than last year, it was doubtful up to the end of November if this could actually be accomplished. The log output of the Ottawa Valley companies will be higher, but owing to labor and weather conditions, it is not yet known what the percentage of increase will be.

Transportation remained about the same, if it did not show some improvement over October. During the last two weeks of November more foreign cars became available for shipments to the United States. This, the trade believed, was due to the arrangement arrived at whereby the Grand Trunk agreed to let its cars go into American territory.

The soft coal situation in the United States as effecting imports into Canada, causes some concern. Woodworking plants operated by steam will be the most seriously affected. To the trade it also signifies that allied industries using wood or lumber products may have to shut down. The position of the Massey-Harris Company was cited as an instance. Mr. Frank Hawkins, secretary of the Canadian Lumbermen's Association, views the coal import situation as being one of the utmost gravity to the Canadian lumber trade.

Montreal Trade Slackens Toward Close of Year

The Montreal market is without material change. Business locally is only fair, but one looks for a decline at this time, when building is inclined to slacken. Considering all things, trade has been maintained at a satisfactory level, and if reports from architects and contractors are any indication, there should be a pronounced revival next year. There is an optimistic feeling generally, especially as labor troubles are being gradually smoothed out.

The prevalent idea is that lumber will cost more in 1920. While the cut may be heavier, the cost will no doubt increase, based on high wages and expensive provisions for the camps.

Orders for the States are nothing to boast about. Montreal firms have done exceptionally well this season, and as the stocks have been arriving over the border faster than retail sales have been, orders naturally slowed down.

There is a very good demand for hardwoods, with prices on a firm basis.

The B. C. section is strong, with a moderate business passing. The great trouble is that wholesalers are very much at sea as regards prices, and some will not accept orders without telegraphing to the Coast.

Woodworking firms are exceptionally busy, and one of the largest sash and door and interior trim companies has stopped taking orders.

The export season is now over. Practically the whole shipments have been on Government account, the entire stock from this port having been sent to the other side. A comparatively small amount remains in Quebec. There are, however, very large stocks in St. John and Halifax, which are now being shipped.

The pulp market is very firm both for sulphite and mechanical description. There is a world-wide demand for pulp, with indications of this being continued next year. The Riordon Company are exporting to Great Britain, Japan, France and other countries.

J. F. Munro Killed in Plane Crash

James F. Munro, one of the most prominent and valuable citizens of Pembroke, Ont., and Pilot P. E. Dobbin, an aviator of note, who rendered splendid service overseas and whose home is in Medicine Hat, were killed on the outskirts of the village of Eganville recently when the Victory Loan aeroplane in which they were proceeding to Ottawa crashed. Both deaths were instantaneous or almost so, Mr. Munro being dead when first assistance arrived and the pilot drawing his last breath before medical attention could reach the spot.

The late Mr. Munro was the owner of the Pembroke Woollen

Mills, which under his stewardship has become one of the town's most valuable industries. Recently he purchased all the stock of that concern, and had built a large addition to the plant. He was a director of the Steel Equipment Company, the Thomas Pink Company, manufacturers of lumbermen's tools, the Superior Electric and president of the Pembroke Iron Works. For a number of years he was president of the Massey Lumber Company.

Mr. Munro was born in the township of Fitzroy, Carleton County, in the year 1873, and received his early education there, coming to Pembroke in 1880. In 1911 Mr. Munro contested the riding in the Liberal interests and was defeated and he had been asked to run several times since. For three years he sat on the Town Council and was nominated for Mayor at the conclusion of his term, but declined to run.

Annual Meeting of District Six

Secretary J. B. Mackenzie, of Georgetown, Ont., has called the annual gathering of District No. 6 of the Ontario Retail Lumber Dealers' Association to meet in the Council Chamber at Orangeville on Friday, December 5th at 1.30 o'clock in the afternoon. Officers will be elected for the ensuing year, reports presented and a general discussion take place on various matters of importance to retail lumber merchants.

Average Life of Telephone Poles

W. H. Winter, superintendent of plant of the Bell Telephone Co., Montreal, in giving evidence at the inquiry by the Railway Commission into the application by the telegraph companies for increased rates, brought out an interesting fact as to the life of poles. This he put at 14 years on the average and explained that the fast growing British Columbia mountain cedar used on lines west of Moose Jaw is good for only ten years, while the eastern cedar will often give service for eighteen years.

Would Like Our Crown Land Pulpwood

The Resolutions Committee of the American Newspaper Publishers' Association recently made the following recommendation at a special convention of the association which was adopted. "That the White Paper Committee and the Legislative Committee of the A. N. P. A. urge the enactment of such legislation as will permit the development of waterpower that our timber lands may be made fully available for the manufacture of wood pulp, lumber and paper, and we also recommend that Congress be urged to take steps that will induce the Canadian Government to repeal the order-in-council prohibiting the export of wood cut from Crown lands."

Price Bros. Will Erect New Paper Mill

A big movement for the further development of the pulp and paper industry in Canada will be started in the Province of Quebec shortly by the firm of Price Bros. and Company.

Statistics show that the manufacture of pulp and paper is one of the greatest industries which Canada possesses at the present time, the daily output of paper in this country being 2,200 tons, as compared with 2,900 tons in the United States.

Of Canada's daily output, 260 tons are manufactured at Jonquiere and Kenogami by Price Bros. and Company, and machinery is being installed to bring this output up to over 300 tons a day.

The firm has plans for further expansion and in an interview Sir William Price, the president of the company, outlined his plans as follows:

"My board has definitely decided to start work without delay on a large newsprint mill in the Saguenay district, with a capacity of between four hundred and five hundred tons.

"Work has already been started on the necessary water power and by May of next year, construction of the mill will be under way.

"A further machine is now being erected in our Kenogami mill. This machine would have been working now had it not been for the strike in England. This brings our present output up to 270 tons, or, including Jonquiere, to 325 tons per day of paper and board, in addition to sulphite pulp.

"When our new plant is operating our total output of paper and board will be in the neighborhood of 800 tons per day."

With the erection of the plant a new town will spring into existence. The site is about three or four miles east of Chicoutimi and the town will be called "Saguenay."

It is situated on tide water, and free from the usual tide delays that are experienced at Chicoutimi. An excellent level plain stretches to the south and west, and the whole area is most fittingly adapted for a large manufacturing and industrial centre.

EDGINGS

Ontario

McGibbon, Limited, of Sarnia, are doubling their facilities for handling lumber, and will have one of the largest sheds in the province.

The Peace Tie & Lumber Co., Ltd., Sault Ste. Marie, Ont., have been incorporated to manufacture and deal in timber and lumber and all products thereof. Capital \$40,000.

The planing mill of William Gerry & Sons, London, was damaged recently by fire to the extent of \$23,000. The blaze is believed to have been caused by a spark from a passing locomotive.

The Bishop Lumber Co. of Nestorville, and the Searchmont Lumber Co. of Searchmont, Ont., are taking out considerable quantities of wancy timber at the present time in the Parry Sound district.

Abitibi Power and Paper Company of Iroquois Falls announces that its production for three months ending Sept. 30 was 17,002 tons of newsprint, 4,513 tons of pulwood pulp and 1,511 tons of sulphite pulp.

The Elliott Machinery Co., Ltd., Belleville, Ont., has been incorporated to manufacture and deal in woodworking machinery, and to take over the business now known as the Elliott Woodworker Co. of Toronto. The capital is \$250,000.

A company, known as Ontario Tie, Timber and Construction Company, Ltd., composing H. H. Davis, E. H. Brower, J. R. Robinson, B. R. Davidson and W. W. Lang, all of Toronto, has been formed with head office at North Bay, and is capitalized at \$350,000.

The Matheson Lumber Co. are erecting a new sawmill at Matheson, Ont. The capacity of the plant will be 25,000 ft. a day, and the mill will be of the most modern construction, being built upon a concrete foundation, while power will be supplied by a 125 H.P. boiler.

The Seaman-Kent Co. of Toronto, who recently purchased the old Tudhope Co. factory, in West Lorne, Ont., for the making of hardwood flooring, intend erecting an addition to the premises. About sixty hands will be employed in the new branch of the company.

Rankin & Company's planing mill and lumber yard, 1536 Dundas St. West, Toronto, was damaged recently to the extent of \$2,000, when a fire broke out caused by small boys smoking cigarettes, one of which was dropped in between two logs and set fire to some sawdust.

Hayward Lumber & Tie Co., Ltd., have been incorporated to manufacture, buy and sell and deal in lumber, timber limits, standing timber, etc., and to carry on a lumbering business in all its branches. The capital stock of the company is \$100,000, and the head office is at Argolis, Ont.

The Porter Lake Lumber Co., Ltd., Port Arthur, Ont., have been incorporated to carry on business as timber merchants and to manufacture and deal in timber, lumber and wood products of all kinds. Capital \$40,000. A. J. McComber and W. F. Langworthy, of Port Arthur, are two of the incorporators.

The Canadian Sault Lumber Co. is conducting extensive operations in the township of Pennyfeather in the Sault Ste. Marie district. This is a Chicago firm, of which P. H. Duket is president and W. H. Rath, secretary. The company intend erecting mills for the cutting of hardwood and other timber.

J. F. Paige, general manager of the Port Arthur Shipbuilding Co., Port Arthur, Ont., left recently for Halifax, to take charge of the shipyards in that city. Previous to his departure he was presented with a handsome cabinet of silver by the foremen and shop superintendents of the Port Arthur Shipbuilding Co.

W. L. Card, Nashville, Ont., states that the building trade has been rather slow in his locality for the last few years, but he has hopes that it will improve during the coming season. Last winter he operated his sawmill, but did not have a large quantity of hardwood to cut. The mill will be running again this season if sufficient snow falls.

Kelly Bros., of Bridgenorth, have purchased the old mill site in Lakefield, Ont., where the Lillicrap-Tate Lumber Co. operated from 1902 to 1910. They are moving their Bridgenorth mill to Lakefield and will have everything completed by next summer. The site is an excellent location on the Otonabee River and on the G. T. R. siding and dock.

The Bancroft Lumber & Mfg. Co. Ltd. has been incorporated with a capital stock of \$40,000, and head office in Bancroft, Hastings County. The company is authorized to carry on a general lumbering and manufacturing business. The incorporators are E. S. Hubbell and U. A. Hubbell of Faraday Township, D. A. Davis of Windsor, D. W. Avey of Detroit and others. The company will erect saw mills at Paudash Lake, Ont., at a cost of \$50,000.

James L. Legree, of Calabogie, and John Craig, Darling, have made a purchase of timber rights on the old Rathbun limits up at the Chain rapids and are putting in a camp, with John K. Culhane, of Ashdod, as foreman. Since lumbering operations by the Deseronto Company ceased there, what that firm left standing has grown considerably, and Messrs. Legree and Craig will doubtless take off much good timber for sale in a constantly rising market.

Herman Raney, father of Hon. W. E. Raney, K.C., of Toronto, Attorney-General for Ontario, passed away very suddenly in Rochester, N.Y., where he was spending the winter with his daughters. The remains were brought to his old home in Aultsville for interment. The late Mr. Raney was born in 1835 and for many years was engaged in the lumber business of Cook Bros. at Lawrenceville. He retired from the industry several years ago and went to live in Aultsville.

Carl Sorensen, of the Carl Sorensen Lumber Company, has returned to Fort William from Crozier, near Fort Frances, where he has established a lumber camp, in which twenty-five or thirty men are now at work. Only this camp will be operated this year, but others will be established later on.

"By-Pass" Blower Systems

for green saw dust and wet stringy material

Material that usually clogs the ordinary Blower is handled easily and continuously by our "By-Pass" Blowers. No material passes through or around the fan. That is the big secret of "By-Pass" success. Slow speed and minimum power are other strong features. Write for literature and all details.

We manufacture and install complete systems

Toronto Blower Company

156 Duke St., Toronto

The present condition of the bush, he says, is detrimental to the lumber man. There is no frost in the swamps and about a foot of snow covers the ground, making traffic with a horse very hard, and the men are now anxiously waiting for real cold weather. The new company, for the time being, will cut their wood on cedar tracts and will make telegraph poles, fence posts, etc.

Eastern Canada

Fraser's Limited which recently purchased the B. A. Mowat mill at Athol, N.B., also all that firm's lumber limits, commenced the construction of their new large mill at Athol, recently.

The sawmill and box factory at Bedford, N.S., owned and operated by Moirs Limited, biscuit makers and confectioners, has been destroyed by fire. The building and machinery were insured for \$50,000.

The new saw and planing mill of the Kent Lumber Co., Granby, Que., is about completed. The owners are in the market for the following equipment,—2 horse-power motors, blower and piping, scroll saw, sander and shaper.

La Compagnie de Bois, Fortin Limitee, Chambord, P.Q., have been incorporated to manufacture and deal in lumber, pulp and wood products. Capital \$25,000. E. Roy and R. Langlais, both of Quebec, are among the incorporators.

The sawmill and box factory at Bedford, N.S., owned and operated by Moirs, Limited, biscuit makers and confectioners, was destroyed by fire recently. The building, which was fully occupied with modern machinery, was insured for \$50,000.

The W. H. Miller Co. of Campbellton, N. B., state they are having no labor shortage in their winter camps and logging operations are proceeding satisfactorily. The hours of work at the sawmills were reduced during the past season from ten to nine a day.

A meeting of the Quebec Forest Protective Association was held in the office of the Minister of Lands and Forests in Quebec on the 5th of November to discuss needed changes in the fire laws, publicity work and improvements in fire fighting methods.

The "finis" was given recently to the strike of the Montreal building trades which started on Labor Day, and in its early stages affected about 12,000 workers. Agreements were gradually reached between the contractors and the men have all returned to work.

An order-in-council was passed at Quebec recently giving to the great dam on the St. Maurice River the official name of the Gouin dam. This barrage of the St. Maurice River is the largest in the world, and is calculated to develop millions of hydro-electric horsepower.

A federal charter has been granted the E. C. Plant Lumber Co., Limited, with a capital stock of \$50,000, and headquarters in Montreal. The company is empowered to carry on the business of lumbering in all its branches and to manufacture and deal in logs, lumber, timber, wood, etc.

The Riordon Pulp & Paper Co. intend erecting, in the near future, 100 workmen's houses at Kipawa, Que. The company will secure a loan from the Quebec Housing Commission to put up these workmen's residences on the new town site of this large plant, which will be operating within a few weeks.

A charter has been granted to Royal Roussillon, Limitee, with a capital stock of \$49,000, and headquarters in Montreal, to manufacture and sell materials of various kinds, including floorings, wainscottings, mantels, furniture, etc. The incorporators are John P. Hammerdi Joseph R. Papineau and others.

A large sawmill belonging to the Jackman Lumber Company, Quebec, was entirely destroyed by fire recently. For mill hands were badly burned when they were trapped inside an adjoining building that was surrounded by fire, but all are expected to recover. The material damage is estimated at \$125,000.

Lumber shipments from Bathurst, N. B., have been brisk the past two months, quite a number of large vessels having loaded and sailed for foreign ports, including the American schooners Margaret Thomas, cleared for Buenos Ayres; Edwin G. Farrar sailed for an Irish port; Charlotte A. Maxwell and Theoline, both in port loading for Havana, Cuba.

The firm of Price Bros. and Company, Quebec, has purchased Kent House, a historic property situated on St. Louis street, opposite the Quebec Court House, for the purpose of erecting a large office building for the firm. The property acquired was at one time the city residence of the Duke of Kent, Queen Victoria's father.

The mill and machinery which was recently purchased by the River Valley Lumber Company from the Flewelling Company at Hampton, N.B., to replace their ill at Oromocto, which was burned there some time ago, has been towed up the St. John river to Oromocto on large scows. It will be set up at once on the new site and will be ready for operation early in the spring. It will have a daily capacity of 75,000 superficial feet, the building being 40 by 120 feet.

While moose hunting at Upper North River, ten miles from Truro, N.S., Willard C. Lynds made the discovery that between four and five hundred thousand feet of lumber, the property of Hon. W. D. Hill, had been destroyed by fire. The lumber was several miles from the main highway, and owing to being sawed in the late spring, could not be got out till winter. The cook and bunkhouse were not destroyed. The origin of the fire is unknown. This lumber is likely on the MacDonald lot. It carries some insurance.

The Brown Corporation on November 14 and 15 entertained a number of Boston financiers and brokers at Quebec and La Tuque, P.Q. The company have decided to enlarge their pulp and paper production, at La Tuque mills, and the visitors, starting from Quebec city, visited the pulp mills and also La Loutre Dam. On returning to Quebec they were entertained at luncheon at the Chateau Frontenac, Mr. Downing Brown presiding.

Representatives of the Canadian Export Paper Association recently visited the plant of the Belgo-Canadian Pulp & Paper Company at Shawinigan, P.Q. They were welcomed by Messrs. Biermans and Stadler, the general manager and assistant manager of the company. The representatives, after inspecting the plant, were entertained at dinner, at which short speeches were made by Mr. Stadler; Sir William Price, Mr. Apedaile and Mr. John Ball, of Price Bros., & Company, Limited; Mr. Rossiter of the Brompton Pulp & Paper Company; Mr. Thomas Wark of the St. Maurice Pulp & Paper Company; Mr. Cahoon and Mr. Sabbaton, of Laurentide Ltd.

Algoma Steel Corporation, Limited
Sault Ste. Marie, Ontario

Treat It As An Investment

There are many types of Camp Ranges marketed. So many, in fact, that a buyer is confused. Your problem, in every case, is to endeavor to obtain equal service from equal payment. Purchase wisely, accept a

McClary's "Algoma" Steel Range

and treat it as an investment. And why? Experience will demonstrate that the Algoma is not content to give equal service. Its solid foundation of quality materials maintains its capabilities for work far beyond the ordinary lifetime of a Camp Range.

The Algoma has recorded some mighty fine achievements in length and quality of service. A strong, durable steel body, rivetted and bolted together by skilled men of knowledge, a heavy cast-iron top withstanding the most exacting requirements—altogether, a rigid and durable construction built by the largest stove manufacturers in the British Empire for a special need.

Truly, the Algoma Steel Range is the Lumberman's companion for camp days, the cook's delight at meal times and the buyer's pleasant recollection for many years to come.

A line to our nearest Branch will bring you the full information which you will find of great interest—write to-day.

(TRADE MARK)

High Humidity KILNS

STURTEVANT High Humidity Lumber Kilns are a distinct revelation—heralding a tremendous advance in the history of lumber drying; originally developed for—

and adopted, after rigid and exhaustive tests by—the government to dry wood used in aeroplane manufacture.

Dry Wood—Quickly—Without Spoilage!

Instead of months and even years as required by old, crude, inefficient kilns, Sturtevant High Humidity Kilns dry evenly throughout all kinds of woods in a few weeks. No casehardening, checking, splitting, or honeycombing!

The sturdy construction insures lasting and reliable operation. Compartment type design

permits easy and frequent tests, as well as individual treatments. Temperature and humidity are under easy automatic control, and circulation of air is positive.

Our large staff of kiln and engineering experts is always at your disposal.

Consult them! No obligation incurred. Request catalogue No. 254-C.

Sturtevant Kilns Dry Uniformly—No Casehardening Checking Honeycombing or Splitting

Peeling Potatoes

requires much labour—all the way from one to five men or more, according to the size of the camp being assigned to this work—furthermore, there is a great waste in hand peeling—it has been proved from 20% to 30%.

The Cyclone Vegetable Peeler

will peel and wash a bag of potatoes in from three to five minutes, and effect a saving of from 25% to 40% on material alone. Write for circular "L."

Information and
Booklet

The Cane Mola Company of Canada, Limited
118 St. Paul Street West, Montreal

Sprinkle Cane Mola over your straw, old hay, corn stover, fodder, ensilage, screenings, etc., and reduce cost of feeding.

Cane Mola will keep your horses healthy and improve their appearance. They will winter at hard work and finish in excellent condition in the spring.

Cane Mola is ideal for keeping horses in good shape during the winter in the lumber camps.

ANALYSIS

The value of Cane Mola is principally in its sugars, salts and flavor.

It contains other ingredients of value.
Sugars (average) 55 per cent.
(guaranteed minimum 52 per cent.)
Other Carbohydrates (average) 15 per cent.
Natural Salts (average) 5 per cent.
(not over 7 per cent.—just the right amount to act as mild laxative.)

No fibre.
Protein 4 per cent.
Moisture 4 per cent.

Reasons
Why
You Should Use

ATKINS STERLING QUALITY SAWS

Reason No. 1—ATKINS STEEL

Reason No. 2—ATKINS WORKMANSHIP

Reason No. 3—THE TEMPER

Reason No. 4 -- The Name

INSEPARABLY linked with the Atkins' name is the reputation of a saw which has never been found wanting. The name itself is of particular importance and unquestionable value to all classes of saw users the world over. It is the synonym for quality and the watchword of all that is best in saw making. The novice can buy an Atkins' and be assured of its value by its name. To the experienced judge, the name stands for more than value—it represents merit. This has made it the first choice of discriminating users of saws who invariably prefer Atkins' for all purposes. Be sure the name appears upon *your* saws.

SYRACUSE BABBITTS

in the machinery
bearings of the
biggest lumber mills
in the world

Question No. 5

Why are some bab-
bitt metals slow and
sluggish in their flow
when they are being
poured?

Answer to the ques- tion in the circle

A frequent cause for a metal being sluggish in flow is that it was made of scrap metal, which contains clings of zinc and iron. A small fractional percentage of either of these impurities in a babbitt will slacken the flow of the metal and defective bearings almost invariably result.

This will explain, in part, why you pay more for Syracuse Babbitts than some others—we use only the highest grades of metals in alloying our babbitts. The easy flow proves it.

Let us suggest the right bab-
bitt for the bearings of your
machinery.

Here you see a photograph of Mill No. 3 of the Virginia & Rainy Lake Lumber Co.

How Friction Surfacing Lowers Manufacturing Costs

To the average mechanic, when belting a machine to a shaft pulley, a belt is just a belt, if it is the right size.

Efficiency and economy of operation, or that it was made for a particular purpose, is not considered.

For more than fifty years we have solved transmission belting and equipment problems, and have developed a special friction rubber compound for our transmission belting, and unless you and your employees avail yourselves of our knowledge and experience, our efforts to lower your manufacturing cost will, in a measure, be lost.

Dominion Friction Surface Belting

is not coated with a dressing—a friction surfacing—it is special frictionized rubber with which the entire belt is saturated. Therefore, it retains a pulley grip that prevents practically all power waste, even when worn wafer thin.

Our engineers will, without charge, gladly show you how friction surfacing will help to lower your manufacturing cost.

Tell your transmission troubles to our nearest Service Branch.

Makers of
Dominion Hose, Packing and
Industrial Rubber Goods and
Dominion Tires, the GOOD
Tires for every purpose.

LINK-BELT SAW MILL CHAIN

BY REASON of the long continued maintenance of such high standards of excellence, insured by rigid tests and careful inspection given to every foot of Link-Belt, by a skilled chainmaking organization; and our large available stocks; we have developed our line of saw mill chains to a high standard of quality. We solicit your business on the basis of quality and service.

Look for this trade >—< mark on each link. It identifies the genuine Link-Belt—every link of which is guaranteed.

BOLINDER'S

HEAVY CRUDE OIL ENGINES

The most Efficient and Economical Motive Power For Tow Boats and Barges

FACTS THAT TALK:

The following information has been gained from the engine-room log-book of the "Askelad," covering the first eight months of operation, from December, 1918, to August, 1919.

Average Fuel Consumption per hour, actual running time, 13¾ gallons or 0:43 lbs. per brake horse-power. Total cost of the fuel oil, based on Canadian prices, would have been \$1,111.59. With a coal burning steamer, using coal at \$6 per ton, the cost would have been \$3,000.00—a saving of \$1,900.00 for the Bolinder-Engined vessel.

Total Cost of Repairs, two dollars and seventy cents, namely, six air valve springs at 45 cents each.

Actual Running Time, 1,238 hours, during which time the engines were stopped only for a few minutes for minor adjustments.

The above is a typical example of BOLINDER SERVICE, ECONOMY and DEPENDABILITY.

The concrete motorship "Askelad," 170 ft. x 31 ft., 1,050 tons D.W., equipped with twin 160 B.H.P. Bolinder engines; speed, 9 miles per hour.

When You Overhaul Your Mill

THERE are wet places in every saw and pulp mill where nothing but the highest class belting can "make good." It is for these wet places that we recommend what most mill-men swear by—our

"ACME WATERPROOF" BELT

This belt is especially made for a rough and trying service. It has less stretch than any other belt by 15 to 25 per cent.

When you are overhauling try a Goodhue "Acme Waterproof" belt. Other Goodhue belts are "Extra" and "Standard."

Prices and Particulars on Request.

Thousands of sawyers will tell you of their experiences with other saws before they permanently selected Disston High-Grade Cross-Cut Saws.

They will tell you of hard work with others saws that "bind" and won't "take hold."

Usually, they also speak of having tried saws that wouldn't hold their set in "hard cutting."

Then, too, they sometimes say they lost much time with saws that had to be sharpened "every time you turn around."

Now these men insist on Disston Cross-Cut Saws—they know that to use an inferior saw is to waste time and energy.

HENRY DISSTON & SONS, INC., TORONTO, CANADA

Branch: Vancouver, B. C.

All Disston Cross-Cut Saws are made of a special grade of Disston Crucible Steel—an exclusive Disston product—made only in the Disston plant.

It is the strength and edge-holding qualities of this famous saw steel, combined with right design and workmanship, that has enabled Disston to maintain acknowledged leadership in saw making for nearly eighty years.

DISSTON-SAWS

No. 134 is Particularly Suitable for Heavy Work

It's a big, powerful, extra-heavy planer which is especially adapted to general surfacing and sizing, as well as planing and matching, and is widely used in plants that require a combination machine of large capacity.

Built with a powerful feed of six 10-inch rolls, each roll power driven at both ends, providing a smooth, powerful feed and insuring a longitudinal alignment of rolls when running on narrow stock.

Equipped on order with our regular H. & B. Profiler for making formed cuts. Placed at the out-feeding end, this device adds all special cuts to the stock as it leaves the machine, at the same passage at which it is dressed and at the same speed, making it an excellent machine for standard planing mill equipment.

Built in six sizes to surface up to 15, 18, 20, 24, 26 and 30 inches wide by 8 inches thick. The 20, 26 and 30-inch sizes are fitted, on order, with upper infeeding roll and upper chipbreaker divided into two sections with taper center-guide, for dressing two pieces of material at one passage. Has regular side guide for matching and all other four-side work.

Get all the facts about the No. 134—write for circular.

Hall & Brown Wood Working Machine Co
Saint Louis, U.S.A.

Home Office and Factory, 1913 to 1933 North Broadway

Maple Leaf SAWS

Maple Leaf Circular Saws are made of Special High Grade Steel, accurately ground; have hard-tempered center which makes a stiff blade that will stand up under the most severe conditions, and is less liable to push over in case of accident.

Let us prove it to you if you have not discovered it already.

EVERY SAW GUARANTEED.

FIRE BRICK

We make several brands of fire brick made by every known process of manufacture from a selection of various high grade Pennsylvania clays. This enables us to furnish the best adapted fire brick for your boilers, dutch ovens, refuse burners, kilns, etc.

We specialize in fire brick for power plants and if you will advise us whether your boilers are hand fired or stoker fired and kind of fuel used we can then give you the proper brick for your work.

We carry a large stock of our different brands in various sizes and shapes in our Hamilton warehouse, which enables us to ship at once.

We manufacture the following well-known brands:

**"Elkco Special," "Elk Steel,"
"St. Marys," "Keystone" and "Rotex"**

Write for copy of our catalogue,
"Refractory Efficiency Engineering."

DIXIE DRAG SAW

A 4 H. P. Portable Single Cylinder 2 Cycle, Gasoline Rig, upon skids. Weight, 280 Lbs. Makes 125 strokes per minute. Cuts Logs 7" to 72" Diameter.

Easily started and moved. Runs as smoothly as the Liberty Motor. The Solution of the present and future Fuel, Labor and Car Shortage.

Economical of fuel and never grows weary.

Saves Labor. May be taken to the Forest for cutting Logs, Fuel and Short Bolts for Stave, Heading, Shingle Bolts, Handle, Charcoal and Alcohol Wood.

When not required for sawing, Dixie Engine may be used for driving Pumps, Dynamos, Churn, Feed Cutters, Mixer, etc.

Price \$225.00

Extra 5 ft. or 6 ft. Saws, each \$12.00

Extra 6½ ft. or 7 ft. Saws, each \$14.00

Prescott's Valve Controller

Patented June 8, 1915

The Machine You Have Been Waiting for.

To eliminate every trouble with your Steam Feed Valves install one of these machines.

Six Real Reasons for Doing So:

- 1—Gives the sawyer the easiest kind of control of valve.
- 2—Hand lever stays put, making them safe against any jerk or kick of valve.
- 3—Gives the sawyer every confidence in handling valve.
- 4—Will prevent accidents—is easier on the nerves and carriage runs steadier.
- 5—Water flowing into valves from foaming boilers does not fret the sawyer.
- 6—This relief from all troubles of which sawyers have complained enables them to give closer attention to the logs they are cutting and a better inspection of the lumber they produce.

Read what one of the largest lumber companies on the north shore has to say about it.

We are sole Canadian manufacturers of these machines.

Pamphlets with full description and prices on application.

Let us quote you also on our new "Hamilton" Vertical Steam Feed Valves.

WHAT IS IT?

PRESCOTT'S VALVE CONTROLLER

Waubushene, Ont., Sept. 11, 1917.
Messrs. Wm. Hamilton Co.,
Peterborough, Ont.

Gentlemen:—

Replying to your inquiry re Prescott Valve Controller, which you sent us last spring to try out: I beg to say that we installed this machine early in April, just previous to starting the mills, selecting the most difficult valve we have to handle, the steam having to travel through nearly three hundred lineal feet of pipe to reach this valve, and noting the fact that the pipes are well covered, there is necessarily considerable condensation, and every sawyer knows the annoyance caused by water passing through the valves which violently jars or jerks the lever, sometimes wrenching it from the hand and thereby inflicting serious damage to the machinery of the mill. And now after nearly five months of daily use, I am pleased to tell you that this device has put up all that is claimed for it. There is not the slightest jar or vibration to be felt, no matter where the lever is held. It is very easily attached and does not interfere in any way with the free movement of the lever, and the Sawyer, Mr. George Botting, also our Foreman, Mr. W. A. Gill, both speak of your controller in the most glowing terms. I can, therefore, congratulate you on securing an article that will fill many a long felt want.

Yours truly,

(Signed) D. B. Anderson,
Chief Engineer,
The Georgian Bay Lumber Co., Ltd.

The Largest Veneer Lathe in the World is a Coe

This one, operated in the South, cuts large hardwood logs 200 inches long, the veneer leaving the machine of the required thickness in a wide continuous and smooth sheet.

Out in the Great Pacific Northwest, where the giant Spruce and Fir trees grow, Coe Lathes are cutting logs 7 ft. in diameter and over 10 feet long into veneers of various thicknesses.

These large improved machines are the result of our 67 years continuous experience specializing on veneer manufacturing problems throughout the world. Our organization and modern plant facilities enable us to design and build large or special size machines to meet the most exacting veneer requirements.

Put your veneer cutting problems up to us. Our experience and service are at your disposal.

Have you a copy of our new Bulletin No. 101 on the drying of veneers without defects?

The Coe Manufacturing Co.
Painesville, Ohio, U. S. A.

Pyrene Fire Extinguishers

Are the Ideal Fire Protectors for your mill, for the following reasons:—

- 1st—Pyrene is death to all inflammable fires.
- 2nd—Pyrene does not freeze at fifty degrees below zero.
- 3rd—Pyrene does not deteriorate.
- 4th—Pyrene is easily operated and ever ready.
- 5th—Pyrene reduces your Fire Insurance rate 15 per cent when installed on your Automobile or Motor Truck.
- 6th—Pyrene has served with the boys at the front.
- 7th—Pyrene in one of our Holsters is ideal for your watchman in case he locates a fire in your building.

We also carry the 2½ Gal. Soda Acid Extinguisher

Ask for our Catalogue which contains a full line of fire appliances, also for our book on how to protect your factory. This book contains valuable information.

We do not lose interest in Proctor Dryers immediately after selling and installing.

Once each year we aim to send an expert to inspect every Proctor Dryer in operation. If the dryer isn't right he MAKES IT RIGHT before leaving. We want every Proctor Dryer to be O.K. all the time.

Naturally, this service is of great value to the user and is appreciated, and this is one of the reasons why owners are always so willing to recommend Proctor Dryers.

Yes, it pays to install a Proctor Dryer from the service standpoint alone.

In addition we offer minimum floor space, minimum labor requirements, minimum heat and power consumption, maximum capacity, absolute constancy of temperature and humidity conditions and highest quality product.

Tell us your drying problem in detail. There's Proctor Dryer for every drying need.

Oldest and Best

HOE

Chisel Tooth Saws

Choice of Lumbermen Everywhere

The even temper of these saws and the fine quality of steel from which they are made have proved Hoe saws reliable for nearly one hundred years.

More than one hundred thousand "Hoes" are to-day successfully sawing lumber in all parts of the globe. The Hoe Chisel Tooth Saw, invented 40 years ago, is still the best for cutting hardwood.

Special Flanged Shanks and Superior Bits Supplied

America's Oldest Saw Manufacturers

Rubber Goods FOR LUMBERMEN

Belting Our long experience in the making of Rubber Belts enables us to specialize on this line. "P.M.S.," "Special Drive" and "Lion" are our leading brands for power transmission.

Packings "Redstone" High Pressure Sheet Packing has proved by test that it will outlast any other similar packing on the market. We make Spiral and Ring Packings, etc., that are equally reliable.

Hose for Steam, Water, etc., in various grades, made especially to give satisfactory and economical service under different conditions.

Fire Hose One or more of our twenty brands of Fire Hose will be found, not only in the best equipped Factories, Mills, etc., but in almost every Fire Department in the Dominion.

Some Waterous Bandmill Advantages

1—It is built in 8, 9, and 10 ft. sizes—one for every kind of work.

2—The spring-cushioned, all knife-edged tension device is the most sensitive in use.

3—Upper and lower guides swing about the exact centre of the saw blade.

4—The upper guide is raised and lowered by steam, an accurate, easy and swift adjustment unequalled by any other.

5—Wheel raising device and tilting device are roller bearing.

6—All operating mechanism is enclosed within the columns—sawdust and slivers cannot reach it.

7—Massive design of bed and columns precludes vibration during cutting. This mill is absolutely steady doing the heaviest work.

8—Mandrel bearings, both upper and lower are easily adjustable and align rapidly and accurately.

9—Every part of the mill is designed to make millwrighting easy and adjustments and inspections can be made without difficulty.

10—Waterous Band Mills are designed and built in a plant that has specialized in the manufacture of Canadian sawmill machinery for more than seventy years.

J. R. Eaton & Sons, Limited
ORILLIA, ONT.

Where La-Cloche's mountains guard the way
To the Northern shores of the Georgian Bay
There our pine trees grow in serried ranks,
On the mountain slopes and the river banks.

Nature has fashioned them tall and slim
Full fifty feet without a limb,
Close grained, tight knotted, of texture fine,
From such timbers we saw our Mill Run Pine.

The most perfect lumber without a doubt
That any mill in the land turns out.
If you've any doubt that this tale's untrue,
Phone us and order a car or two.

SHINGLES

NOW

1920 is going to be a banner building year.

The demand for B.C. Red Cedar Shingles is now strong --and daily growing stronger.

The demand to cover next year's Spring operations is going to be abnormal.

**Be Wise---
Order Now**

Don't forget to lay in a stock of B.C. Red Cedar Shingle Booklets for your customers.

Packages sent free on request.

Shingle Agency of B.C.

Standard Bank Building
Vancouver, B.C.

Our Idea of Service

EXCESSIVE rains have retarded hardwood production. We are frank to admit that our stocks are broken from supplying the constantly growing demand of our customers. However, we are producing a fair volume of Ash, Elm, Hickory, Maple, Oak and Poplar with the aim of giving even better service, if possible. And, as always, our customers must be satisfied. If it happens that we can't help you in the above lines we may be able to refer you to someone who can. Ask us.

John I. Shafer Hardwood Co., South Bend

Uncertainties —in most things Certainty in One

"SERVICE" — Something promised but seldom given—the most common word in the lumber language and the most uncommon in the "getting"—that's uncertainty.

It has been our earnest endeavour during 1919 to render "SERVICE" in all our dealings. We will enter the New Year with the same ambition—that's a certainty.

SIMONDS

CRESCENT GROUND CROSS CUT SAWS

ARE absolutely guaranteed First Quality. They cut easy, saw fast and wear exceptionally well. They are of Simonds Steel, made in our own mill. They take the right temper and hold their cutting edge. A Simonds Crescent-Ground Cross-Cut Saw will produce 10 per cent. more timber than any other brand of cross-cut saw which has yet been produced.

Feeding the Camp

IF that is your problem, remember that it is our business, too. We do a tremendous lumber camp trade and are fully acquainted with the food requirements of logging camps. We shall be glad to quote you on any lines you need this year, and will submit special quotations if you will drop us a card. We can supply you with all that's best in provisions and fresh meats, and give you a service you will appreciate.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice, at Buffalo, N. Y., under the Act of Congress of March 3rd, 1879.

Lumber Operations of the Closing Year

The past year has been a rather remarkable one in the lumber industry of Canada and affords another illustration of the words of Scotland's famous bard that "the best laid schemes of mice and men gang aft a-glee." Many were the predictions made at the commencement of 1919, regarding prospects, prices and production, and out of the myriad of prophecies, possibly not one has come true; in fact the average sawmill man and wholesale lumber dealer, as he sits back during the comparatively quiet days of December in his favorite office chair and, amid the haze of a quiet "pipe" reflects upon how matters have eventuated in comparison with the way he "doped them out" during the initial stages of 1919, shows that our ability to read the future by present conditions and past experiences is anything but reassuring.

It is not the intention to review conditions as they exist in the lumber trade—for these are well-known to every exponent of the industry—but when drifting toward the close of another twelve months, it may be interesting to ask some of the profound prognosticators if, in their expression of views on what would take place during 1919, they thought that shingles would go to their present high price; that lath would be almost as rare as radium and command relatively as high a figure; that mill stocks would be lower than ever known in the history of the trade; that abnormal demand would set in from the other side of the border; that British Columbia forest products would find a brisk requisition over the line; that the market would largely be an auction one; that hardwoods would jump from 50 per cent. to 100 per cent. in quotations; that hemlock and white pine would be used in abundance; that big decline

in sterling exchange; that building operations would call for such large quantities of material, and that housing accommodation would be at a premium in every city and town.

Of course it was expected that there would be a pretty fair demand for lumber, but some of the foregoing features were never dreamed of. These are the days when nothing, no matter how colossal, in character, staggers the imagination. We have become used to the surprises, sharp turns, unexpected developments and unparalleled expansion and values. The future appears promising and the question of greatest urgency at the present moment is enlarged production, thrift and efficiency. In these the lumberman will play his part, but just how adequately he will be able to meet the requirements of forest products during next year, it is impossible to foretell.

Many Canadian firms set out this fall with the idea of doubling the quantity of their logging output, but so far, owing to the shortage of help and other drawbacks, have only been able to accomplish a little more than was in evidence at this particular period in 1918. With favorable winter weather and more men in the bush greater stocks of timber will be taken out, and there is no doubt that the demand will be considerably heavier than the production.

There is no sign in the offing that prices will descend. On the contrary it is believed that they will continue to strengthen until the housebuilding and other structural campaigns are further on the way to completion and depleted lumber stocks replenished. Instead of the higher value deterring persons from building, it seems to stimulate activity in many centres, and the rush for materials of all kinds continues. The observation of shrewd followers of the situation bears out the conviction that there is always more building going on in a rising market and when prices are highest than there is when a decline in value takes place. As long as the present healthy and active state of affairs prevails, there can be little doubt that 1920 will be a good one for the manufacturer, the wholesaler and the retailer.

Generally speaking the year just closing has been the most satisfactory one, in spite of the high prices, that the trade has enjoyed since the outbreak of the war, and the coming twelve months bid fair, even in the face of the chaos and clamor, which prevails in certain industrial quarters, to be equally as productive and gratifying in results.

The Expulsion of the Agitator

The labor situation does not seem to improve in many centres. Those who had hoped after the war was over there would be an abundance of men and more evidence of contentment, particularly as the wages paid are the largest ever known in the history of the lumber industry, have been sadly disappointed. While the numbers of laborers available are more numerous, there appears to be more clamor and turmoil in the ranks of the foreigner than ever.

Now the Bolshevik has made his appearance in the camps of the east and his coming may be regarded as a veritable plague. In many centres in the United States and in the West he has been dealt with summarily and sharply. Like a pestilence, this disease on the body politic is hard to suppress and effectively stamp out. The methods of the I. W. W., the Reds, the One Big Union,—call them whatever name you please—are insidious, and clandestine. They play upon the cupidity of the ignorant and the restless, and in the foreigner they have a fruitful ground for cultivation. Many of these, not knowing the language of our country, its institutions, laws and customs, will believe almost any tale that is told them, and then there is the ordinary riff-raff carried about by every breath of opinion or wave of sentiment.

The seeds of dangerous doctrine thus find fruitful soil in many an isolated lumber camp, making it especially difficult to grapple with the problem. In the East practically all the woods superintendents and foremen, clerks and cooks, scalers and teamsters are loyal and hardworking. They have no sympathy with the specious propaganda that is being put forward. The "come on" literature scattered by the Bolsheviks and the I.W.W. is as alluring in tone and

deft in touch as any that was ever put out by a wild cat mining concern or a smooth oil well promoter. To read it one would think that the methods propounded were a panacea for all industrial ills, and that when brought into being the millenium was near at hand; that all lumbermen and loggers are tyrants, extortioners and oppressors—not to make use of harsher terms—that, under their direction, no man was given a square deal and the last pound of flesh demanded of all who enter their employ.

The majority of the big operators in lumber and logging in Canada today have come up through the ranks and have won their way to the front by industry, perseverance, energy and courage. The conditions under which they worked have been immeasurably improved, camp facilities, board, sleeping quarters,—everything around a bush operation—has been placed on a higher and better plane and has kept pace with the upward trend of the times and the enlightened advancement of the years.

The Dominion can do without the foreign agitator and the trouble-making alien. If a man is not prepared to become a good Canadian citizen, then his room is preferred to his presence. Law and order must prevail. Conditions similar to those existing in Russia and Mexico will not be tolerated in a progressive young country like Canada. More production is the need of the world today, not only in lumber line but in all other necessities of life, and the homely virtues of labor and thrift must be exercised to an unusual degree if an era of stringent times is to be warded off.

It may be asked what is Bolshevism, what does it stand for and what does it hope to accomplish? Here is what the "Gulf Coast Lumberman" has to say of the sect. The wording is strong and pointed and there is no searching for fine phrases or beautiful similies. Bolshevism is the antithesis of civilization. The Bolshevik is one who stinks for attention. Like the skunk, he has compelled even the noblest of the earth to notice him. From the top to the bottom, Bolshevism is composed chiefly of featherless buzzards, and moral hyenas. Its instincts are a cross between those of Jack-The-Ripper and Lucretia Borgia. Its idealism is that of the foul Harpies who consorted with Medusa. Its sensibilities rival those of the Yahoos whom Gulliver met. Its morality is just two shades darker than that of the South Sea Islander. Its idea of Heaven is a defenseless woman. Its chief God is a rape-fiend. Its coat-of-arms is a vulture, with outstretched wings. It was bred in darkness, conceived in iniquity, and born in the lower left-hand corner of Hell. Its final resting place will be its shameless birthplace. Let's speed the funeral.

A Vigorous Policy of Forestry

A progressive policy has been announced as one of the principal matters to which the new government of Ontario will first give its attention. Such was the statement made by Hon. E. C. Drury, the Premier, in addressing a recent meeting of the Canadian Club in Toronto. His remarks left no doubt in the minds of his hearers that he has thoroughly looked into the situation and will have definite plans to submit at the next session of the provincial legislature. Mr. Drury stated that the treatment of the forests in the past had been sadly neglected and in this oversight both political parties were equally to blame. The sense of the people is being enlightened and timber is now beginning to be appraised at its proper value.

No longer is the wooded wealth of Ontario and the other pro-

vinces being looked upon as inexhaustible and the patch of bush on a farm regarded as an "eyesore." The Premier added that logging methods had in the past been most extravagant and wasteful, that the slash had not been burned and only the best trees felled, with little thought given to a second growth and not much consideration to replanting, more particularly those lands which are unsuited for agricultural purposes. He intimated that the lumbermen would probably have to pay higher license fees in order that a more comprehensive and far-reaching policy of conservation and reproduction might be inaugurated. To gain first hand knowledge, the Premier, accompanied by the Hon. Beniah Bowman, Minister of Lands and Forests, and others, has been making a tour of the north, visiting the leading towns and making inquiries generally which will doubtless lead to greater development and utilization of the natural resources of that district.

It is gratifying to learn that Ontario, which is known as the white pine province, will continue to husband her resources, and that the forestry policy of the province will be more aggressive and productive than it has been in the past, although splendid work was done during the last few years by Hon. G. Howard Ferguson, the late Minister of Lands, Forests and Mines. He warmly co-operated

with the interests of the lumbermen and instituted many reforms in fire protection and reforestation. Mr. Drury mentioned that a neighbor of his near Crown Hill in Simcoe County has recently sold an acre of hardwood bush for five hundred dollars, which, a few years ago, would not have been thought worth a tithe of this amount.

Ontario has suffered from too many forest fires in the past, and until recent years fire rangers, wardens and other appointments in the forest branch were made on a political basis, rather than on the ground of efficiency and merit. A post of fire ranger was looked upon as a sort of summer vacation, a chance for a life in the open and a general good time on the part of one fortunate enough to exercise the necessary influence to get on the "list." All this has now passed and the forestry administration is more business like, effective and ably managed. The regulations

will be enforced impartially and more regard given to better logging methods and in seeing that the province is not denuded of its rich sylvan possessions. Cultivation will be more actively resorted to and greatly extended in the way of replanting the waste lands.

It is pleasing to record that good progress is being made with the timber survey of the province by Roland D. Craig, of the Commission of Conservation, and staff, and that the reconnaissance work is going steadily ahead. The license holders and lumbermen are lending every possible assistance and co-operation and, in this connection, Mr. Craig states that when the job is completed, there will be reasonably accurate information as to the actual timber situation. He adds that very extensive areas have been destroyed by fire. In the last issue of the "Canada Lumberman" views were presented showing the havoc that has been wrought in certain northern districts by the devouring element. It is said that, on the whole, the reproduction of coniferous species is far from satisfactory from the standpoint of sustained yields, but that, in many areas where fire has been kept out, excellent stands of red and white pine are coming up. Mr. Craig concludes a recent progress report on the work in hand by declaring that, in view of the progressive forest policy of the United Farmers of Ontario, he does not anticipate any change in the co-operative arrangement with the Ontario Government.

Christmas Greeting with Peace & Plenty for the New Year

By the publishers and staff of the Canada Lumberman

Canadian Lumbermen to Meet in Quebec City

Twelfth Annual Gathering Takes Place in Ancient Capital on February 4 and 5— Splendid Welcome Will be Accorded—Executive Gets Down to Business

The twelfth annual meeting of the Canadian Lumbermen's Association will take place in the city of Quebec on Wednesday and Thursday, February 4 and 5 next, and preparations for the great gathering of the industry are now under way.

It is probable that the sessions will be held in the Chateau Frontenac, which will be the headquarters of the Association, but if this arrangement is not possible the city hall will be available. Last February the assembly took place in St. John, N.B., where the visitors were royally entertained and extended every courtesy and hospitality. The pleasant associations of that convention will live long in the minds of the members, there being a most representative attendance from all parts of eastern and central Canada.

The Quebec delegates on that occasion extended a hearty invitation for the members to hold their 1920 meeting in Quebec and, it is expected, an equally warm welcome will be accorded the visitors in the Ancient Capital, which for many years has been a great timber and lumber exporting centre, possessing one of the finest shipping ports in the world. The geniality and open heartedness of the people of the quaint, picturesque and historic city is proverbial, and assurances have been received by the directors of the Canadian Lumbermen's Association that everything possible will be done to make the forthcoming conclave one of the greatest and most profitable annual reunions ever held by the lumber exponents of the Dominion.

Of the twenty-two directors of the Association six are from Quebec, including the President, W. Gerard Power. He is a live factor in the industry of that province, being at the head of the River Ouelle Pulp and Lumber Company, of St. Pacomé, a busy centre on the Intercolonial Railway, seventy-five miles east of Quebec city. His company also operates mills at Crown Lake, Powerville and River Manie on the National Transcontinental Railway. The other directors from the province of Quebec are H. B. Powlika, Québec; Geo. W. Grier, Montreal; David Champoux, Restigouche; W. T. Mason, Montreal, and Alex. MacLaurin, Montreal.

Many Matters Before the Executive

At a meeting of the Executive of the Association held at the Windsor Hotel, Montreal, on December 2nd, there was a representative attendance. President W. Gerard Power was in the chair and among those present were Dan McLachlin, Arnprior, Ont., and Walter C. Laidlaw, Toronto (Vice-presidents of the Association), W. E. Bigwood, Toronto (former President), A. E. Clark, Toronto; E. R. Bremner, Ottawa; Walter M. Ross, Ottawa; Jas. G. Cane, Toronto; W. T. Mason, Montreal; W. J. Bell, Sudbury, Ont.; Duncan McLaren, Toronto; David Champoux, Restigouche, Que., and Frank Hawkins, Ottawa (Secretary).

The meeting was to determine certain particulars in connection with the coming annual meeting, which will be held in Quebec on Wednesday and Thursday, February 4th and 5th, 1920, and to make arrangements for the presentation of reports, etc.

Amongst other matters presented to the Directors was a com-

munication from the Secretary of the Canadian Forestry Association with regard to placing the entire woods branch under the jurisdiction of the Provincial Forester, and operating members in Ontario have been circularized as follows by Frank Hawkins Secretary of the Canadian Lumbermen's Association:

We are in receipt of a letter from the Secretary of the Canadian Forestry Association, advising that at the next session of the Ontario Legislature an effort is to be made to bring the entire Woods Branch under the jurisdiction of the Provincial Forestry, whereby the timber scalers would take the chief positions in the fire ranging service during the summer, and act as timber scalers at other times of the year. It is claimed that not only will considerable economy be obtained in this way but that political interference will be eliminated, and as it is proposed to appoint a Forestry Advisory Board consisting of two representatives of limit holders and three representatives of the Government more efficient service can be rendered.

As an Association we have been asked by the Secretary of the Canadian Forestry Association to support them in this matter, but before doing so shall be glad to have your opinion as to the practical value to the trade which such a change would involve.

Some Statistics of Trade Activity

Recent increases in freight rates on lumber in the Ottawa territory were discussed, together with complaints from two of the members with regard to the non-existence of through rates from shipping points on one line of railway to points of destination on another. The matter is to receive the attention of the Transportation Committee.

It was also decided to get out another pamphlet showing the different species of lumber with the name of those who deal in same.

With regard to procuring information as to the aggregate cut of lumber, shipments, and stock on hand during 1919, a new plan was submitted whereby it is hoped that this information will be available shortly after the end of the year.

Clause 88 of the Bank Act is to be reported at the annual meeting by the special committee appointed for this purpose.

A report on the Employment Service of Canada will also be made to the members at the annual meeting.

The Association is in receipt of advice that there will be a British Empire Timber Exhibition held in London, England, from July 5th to 17th, 1920.

The recent deaths of Mr. John Donogh, of Toronto, also of Mrs. MacLaurin, the wife of Mr. Alex. MacLaurin, of Montreal, a former president of this Association, and Mr. G. Harry Askwith, who was connected with the Riordon

Panoramic view of Quebec, the convention city of the Canadian Lumbermen's Association

Pulp & Paper Co., were referred to, and the Secretary instructed to write letters to the immediate relatives, expressing the deep sorrow and sympathy of the Directors.

A communication from Mr. Louis A. Cadieux, 17 Boulevard des Capucines, Paris, France, together with a catalogue and price list of same was presented, but no action was taken as the sizes mentioned therein are all in metrical lengths and do not admit of Canadian lumber being used economically for this trade.

The President and Secretary were deputed to make definite arrangements for the formation of committees, etc., in connection with the annual meeting and banquet, and further announcements will be made in this regard at a later date.

Australian Hardwoods for Canadian Softwoods

"The Canadian Trade Commissioner is getting busy with regard to the export of Canadian timbers to Australia," says "Building," which is published in Sydney, Australia.

"It is really no use lamenting the fact that Australia cannot provide timber for her wants, and the trade should therefore be given every encouragement. It has been mentioned that Australia is rich in splendid hardwoods, and it would seem that reciprocation in the matter of timber supply is what is really needed, and no one should complain if Australia could provide hardwood equivalent in price for Canada's softwoods. Visiting the latter country it is really lamentable to see the misuse of soft pines. Jetties, railway bridges and sleepers, and all sorts of construction are put in, only to be replaced in a few years, and expedients have to be adapted to compensate for the softness of the timber used; for instance, in railway practice it is found necessary to use tie plates under the rails to prevent the dogspikes from opening out and causing disaster. There is therefore a wonderful opportunity for the exportation of our hardwoods to be developed as reciprocation of softwood imports. Some idea of the value of the latter can be obtained when it is stated that in the year 1913, roughly 200,000,000 feet were imported into New South Wales from Canada, valued at over £1,000,000, and although the quantity of imports has not been maintained during the war, it is likely to be much exceeded in the coming year; for instance, 500,000 doors are

estimated to be required in connection with Government building enterprises, with 70,000,000 feet of flooring per annum.

"It therefore behooves Australian merchants and governments to drop the lamenting about our diminished Australian pine supply, to face the facts, and by every means possible to develop a reciprocal timber trade with our Empire brother—the Dominion."

Good Progress on N. B. Forest Surveys

The Forest Section of the department of Lands and Mines has covered a large area of the Crown lands of the province during the past summer in surveys for the purpose of classification. J. M. Gibson, chief of one of the forest survey parties, returned to Fredericton recently after spending nearly the entire summer on the Little South West Miramichi River, in charge of an eighteen-man cruising party. They cruised upwards of five hundred square miles of timber.

Samuel R. Weston, who was in charge of one of the parties for the department, has returned to the Capital. He ran 230 lineal miles of block lines between the timber limits, establishing the lines for the purposes of the forest survey. The lines are properly blazed and every quarter of a mile a post or tree is marked with block numbers and the number of chains to the corner, so that a cruiser or lumberman can easily locate himself. A new feature of the survey is the placing of location posts where portages cross the block lines, which makes it easier for a cruiser to locate himself on the map when travelling a portage.

Because of the close of navigation on the St. John river the Fraser Companies, Limited, ended the sawing season of the Victoria Mills in Fredericton last month. While figures were incomplete it was said that the season's cut at the mills amounted to fourteen million feet, and that approximately one million feet of logs are being carried over for next season. It was the intention of the company to cut fifteen million feet. The failure to do so is said to be due to the fact that the working day had been cut from ten to nine hours. Regarding 1920, it is understood that sufficient logs will be cut to keep these mills in full operation during the entire season of 1920.

James Gordon, aged sixty-two years, who belongs to Upper Gagetown, Queens County, N.B., was instantly killed while lumbering in the New Brunswick woods on November 21. He was employed in the woods at Shirley, Sunbury County, and was struck down by a falling tree.

First Hand Facts About Canada's Big Lumber Industry

A preliminary report on the lumber industry in Canada has just been completed by the Dominion Bureau of Statistics, Ottawa, covering the returns of 3,086 operating plants for the year 1918.

Capital Investment.—The total capital invested in the industry amounted to \$180,017,178, of which logging and timber plants contributed \$36,516,701, mill equipment \$53,791,373, materials on hand, stocks in process, finished products and miscellaneous supplies \$54,147,889, and cash, trading and operating accounts and bills receivable \$35,561,215.

Employees' Salaries and Wages.—The number of persons employed on salaries was 3,550, of whom 3,270 were males and 280 females, and the total salaries paid were \$4,911,735. The average number of persons working for wages totalled 56,816, of whom 26,736 were employed in operations in the woods and 30,080 in the mills. The total amount paid in wages was \$44,490,917, apportioned as follows: woods operations \$19,985,553, mills \$24,505,364.

Materials, Fuel and Miscellaneous Expenses.—The total cost of these items was \$68,498,520, the cost for each being respectively \$45,335,526 for materials, \$22,570,487 for miscellaneous expenses, and \$592,506 for fuel.

Products.—The aggregate value of production for the year was

\$144,908,864, comprising the following principal items: sawn lumber \$102,335,772, shingles \$8,124,968, lath \$1,560,136, pulpwood \$18,416,438, and miscellaneous products, including cooperage stock, poles, cross ties, posts, veneer, etc., to the value of \$14,481,550.

Lumber Cut by Kinds of Wood.—The principal kinds of lumber cut during the year were in order of the cut: Spruce 1,140,063 M. ft., white pine 783,482 M. ft., Douglas fir 707,373 M. ft., hemlock 255,356 M. ft., cedar 230,204 M. ft., red pine 99,780 M. ft., balsam fir 94,774 M. ft., and all other varieties, including custom sawn lumber, 618,426 M. ft.

Trend of Lumber Prices and World Events

How Soon Will Canada and United States be Buying From Europe More Than the Countries of Europe Need From Us?

By Geo. H. Holt (Holt Timber Co.) Chicago, Ill.

The question of price absorbed the attention of lumbermen a few months ago. Wholesalers and retailers and line yard men were said to have hatched a conspiracy to keep out of the market and watch the price go down. A month ago they concluded it was time to buy but they very soon found that the hunger for lumber was fact to face with famine, and lumber went to a premium, just as silver and pig iron have gone to a premium.

Where there is not enough of a commodity to supply the demand, the people who pay the price get the goods.

Not only has this become a sellers' market but it is a run-away market. The formula is:

"Have you got anything?"

"I'll take it."

"What's the price?"

"Make your own terms."

"How soon can you deliver it?"

Nobody should have been surprised or deceived. This is no time to make comparisons with former prices or former demands. Never before has the whole world devoted itself to five years of destruction of property and massed its industry to hasten that end.

The Appetite for Accumulated Property

Never before was there so little accumulated property and so vast an appetite for it.

Never before so many millions of people with easy money in their pockets and with an itch to spend it.

How long will it last? That doesn't matter now. At least, it will last as long as the conditions last and as long as supply is below the level of demands, and the end of that day is not in sight.

How soon will the demand by foreign governments for loans to pay interest and loans to supply needs come to an end?

How soon will Canada and America be buying from Europe, more than Europe needs from us? When will the needs of South America and Asia be supplied? There are others.

The building permits issued in the United States are three times larger than last year. Hardwood for interior finish and furniture and fittings and industry, have jumped so high that the Price List Committee at Chicago recently voted unanimously that the market is from ten to twenty-five dollars per M above last month's published list.

Hemlock lath sold in Chicago, by carload, at \$15.00 last week. Pine men have just issued lists at \$2.00 to \$9.00 per M above previous lists and are not then at the top of the market.

The strike as a weapon to enforce arbitrary and unlimited demand, has slipped from the hands of the Labor Unions. Winnipeg, Man., Gary, Ill., Boston, Mass., and Beaumont, Tex., have shown how to meet that situation. The menace of a general strike no longer exists and the menace of the I.W.W. and the Bolsheviks in this hemisphere is scotched for a long time to come.

There will be a conflict and struggle between opposing interests, but they will be of limited scope, and will not endanger the existence of law and order and private property.

The "Own your own home" movement is not only good for the lumber business, but is good for the community and the state.

The Inter-dependence of Humanity

We are not rid of the self-seeker in society, in politics and in business, but more and more the world is becoming convinced of the inter-dependence of humanity, and the workableness of the Law of Love. It is not yet the law of business or the law of the state, but it is tolerated as a working hypothesis, and that is a big advance.

Lincoln's words voice the temper of the new era:

"With malice toward none—With charity for all, with

determination to do the right as God gives us to see the right."

Hearts and lips are not yet adjusted to proclaim it but the logic of events leaves no alternative short of chaos, and we cannot choose chaos.

Every considerable community unit ought to have a Housing Association and a Public Welfare Committee to embody and vitalize the principle of the group, as distinguished from the individual.

We know now that the individual is not the unit, that a class is not the unit, that the strong man is not the unit, but

George H. Holt, Chicago, Ill.

that the bundle of strong and weak, wise and simple, employer and employed, men and women and children, is the unit of ultimate consideration and that no individual or class, no matter how aggressive, may seize and permanently hold more than its share of anything.

The Ushering in of a New Era

The finances of the world are badly muddled up but not hopelessly.

Production and barter and intercourse will effect an adjustment that will operate and it will be something broader and better than it used to be.

We mourn and miss the lives that were sacrificed, but more lives have matured during the period of the war than were lost in the war. The world is not better off than it would have been without the war, but as to man-power and woman-power, it is stronger than it was, perhaps vastly stronger.—The training in mass-play will prove a tremendous advantage to the new era. Amplify for yourself the significance of

Demand (world wide)	The new spirit
Supply (limited)	The chastened temper
Buying power	The Will to Righteousness
Man-power	Do not these presage
Mass-play	Progress and
The larger vision.	Order, and

A better world to live in? And incidentally, a high level of price for lumber?

With best Wishes for a Happy New Year,

Very cordially yours,

Geo. H. Holt.

Chicago, Ill.

December 4, 1919.

Will Wooden Shingles be Sold by "Square?"

Proposed Plan Would Provide Simpler Basis of Computation, Eliminate "Short Count" and Comply with All Weights and Measures Laws

At a recent district meeting of lumber retailers held in Ontario the statement was made that farmers and others were buying wooden shingles more and more by the square—100 square feet, five inches to the weather—rather than by the thousand. The term "square" has become familiar to the buyer and the proposal has been put forth by the Shingle Branch of the West Coast Lumbermen's Association that from January 1st next it should be adopted. A letter was sent out lately by J. S. Williams, Secretary of the Shingle Branch of the Association, pointing out the advantage of disposing of shingles by this method and setting forth the simplicity, convenience and other advantages of the plan. It has been stated that the purchaser does not at the present time get a full count of one thousand shingles of certain dimensions but considerably less owing to inability to pack a thousand in the standard packages. It is also contended that if shingles were sold by the square the dealer would pay for the amount of roof covering he bought and not for the number of shingles.

Here is what Secretary Williams has to say on the subject:—

Selling shingles "by the square," in terms of good merchandizing, is selling shingles "on the square."

Ever since Red Cedar Shingles have been shipped out of the Northwest, misunderstandings have arisen as to the "count" or "measure" under which Cedar Shingles are sold. Complaints usually originate with those unacquainted with shingle packing practices, but this does not lessen the feeling on complainant's part that he has been given "short count."

Legal controversy over the unit of cedar shingle sale in at least three states (California, New York and Kentucky) has been ended only after considerable expenditure of time and money. In fact, a strict interpretation of "weights and measures laws" in a number of states would even now force shingle manufacturers to mark the NET COUNT of shingles on each bundle. It is a further fact that there is a wide disparity in the method of figuring covering capacity of a "so-called" thousand shingles. Dealers, carpenters, contractors and even manufacturers estimate this differently. The result frequently is that a builder hauls to the job either too many or too few shingles.

Where Comparisons are Unfair

It is positively common custom the country over to compare the cost of a "square" of patent roofing with the cost of a "thousand" shingles, despite the fact that the latter has fully 16 per cent. greater covering capacity. Even where this fact is appreciated, bothersome computations are necessary to insure a just price comparison. Patent roofing companies frequently cite the "short count" of shingles as an argument in favor of their own product.

The "apparent" saving in initial cost of some substitute roofing over red cedar shingles, without the slightest doubt, has been directly instrumental in causing thousands to buy the former in preference to cedar shingles. ACTUALLY red cedar shingles are generally cheaper in initial cost, but it doesn't appear that way.

All of the foregoing is leading up to the proposal on the part of your Secretary that:

Beginning January 1st, 1920, Red Cedar Shingles be packed so that four bundles have a covering capacity of one square (100 sq. ft.), based on 4½-inch weather exposure for 16-inch shingles and 5¼-inch exposure for 18-inch shingles.

To summarize points making this change desirable:

1. It provides a directly comparable basis for price comparison with other types of roofing materials.
2. It provides a much simpler basis of computation of "shingles required."
3. It does away with all charges that shingles are "short count."
4. It complies with all weights and measures laws the nation over.
5. It provides a sale unit that takes a lesser selling price—a very desirable aid in merchandizing.

This matter has been taken up with many prominent

dealers, shingle salesmen and experts along merchandizing lines the country over. They have recommended the "square" basis unanimously.

The Canadian mills have already taken this matter under advisement and have gone on record favoring the change.

The Proper Time to Make Change

No better time to make this change will ever be presented than "right now" when dealer shingle stocks are lowest in history.

The proposal of this office is to pack the 16-inch shingles 22/22 courses with the openings limited to 1½ inch per course. Laid the standard 4½-inch to the weather four bundles so packed will cover 101.7 sq. ft., providing a margin for overrun of 1.7 per cent.

Eighteen-inch shingles—four bundles to the square, 19/19 courses with openings limited to 1½-inch per course. Laid the standard 5¼-inch to the weather four bundles will cover 102.5 sq. ft., providing a margin for overrun of 2.5 per cent.

This proposal is made to you at this time, so that you may have ample time to ponder this question, both in its broader phases and as to detail, before our Annual Meeting and Shingle Congress. At that time, this matter will be presented for your approval or disapproval.

And remember this—if a change either in a product itself or in its manner of being put up makes that article more "saleable," slight additional costs of manufacture are invariably more than compensated by better prices.

Wealthy Lumberman's Will Probated

A total estate of \$2,145,264.35 was left by the late Hiram Robinson, prominent Ottawa Valley lumberman, who died Sept. 9th, 1919, and whose will has been filed for probate at Ottawa. Up to the time of his death Hiram Robinson was the second surviving member of the old school of Ottawa Valley lumberman. John R. Booth aged 92 years, is the oldest and only surviving representative of the lumbering school of nearly a hundred years ago.

The deceased during his lifetime was a genuine product and typical of the lumbering industry in the Ottawa Valley as it existed in its historic days. Big hearted, generous, and considerate always, though possessing a strong aversion to publicity in life, he nevertheless remembered the charitable needs of the community in which he lived, and his will provides that \$100,000 be given to the City of Ottawa, for the purpose of building a "Hiram Robinson" wing for children, to its proposed \$3,000,000 civic hospital.

Hiram Robinson was chiefly connected in his lumbering activities with the Hawkesbury Lumber Co. in which firm he held at the time of his death 657 shares of stock valued at \$558,450. He also held shares in the Lower Ottawa Boom Co. His interests in the Ottawa and Hull Power and Manufacturing Company were valued at \$111,100, and his ownership of Victory Loan issues amounted to \$571,488.10. He also had \$15,149 invested in United Kingdom Gold Notes. Among the other stocks and holdings shown by the will were: Laurentide Power \$8,795, Southern Canadian Power Co. \$16,032.

The amount of the personal property was \$1,698,053 and real estate \$418,207, book debts amounted to \$5,562, moneys secured by mortgage \$144,957.62, life insurance \$1,000, bank and other stocks \$706,213, securities for money \$648,389, cash in bank \$179,786, personal and other property \$10,643. Mr. T. T. McWaters, nephew, is given 200 shares in the Hawkesbury Lumber Co., Dr. James McKay, nephew, 100 shares in Hawkesbury Lumber Co., Hiram McKay one share in Hull and Ottawa Power Co. Other personal bequests are made to relatives and servants. Twenty-nine thousand dollars is left to the Presbyterian Church of Canada and an additional \$15,000 to Knox Presbyterian Church, Ottawa, for building a manse. Ten thousand dollars is left the Ottawa branch of the Salvation Army for building a hospital. The Protestants Infants Home is left \$2,000, the Day Nursery a like sum. The Perley Home is left \$1,000 and the City of Ottawa \$100,000 for the building of a children's wing containing seventy beds, in the new civic hospital.

Annual Meeting of Montreal Lumber Trade

Work of Past Year Reviewed—Various Problems with Railways Satisfactorily Adjusted—Geo. W. Grier Elected President—Wharfage Rates Increase

The annual meeting of the Montreal Lumber Association was held at the Board of Trade, Montreal, on December 1, P. D. Gordon presiding.

The annual report referred to the proposed increase in wharfage rates and the action taken by the association in the direction of asking the Federal Government to assume sufficient of the debt of the port to render unnecessary further advances in the port charges.

The question of stop-off and re shipping arrangements on lumber, carloads, for planing, tonguing, grooving, kiln drying, and sorting in transit was again raised by the railways this year, and the views of the trade given to the carriers in a joint letter from the Canadian Lumbermen's Association, Canadian Manufacturers' Association, Toronto Board of Trade, and the Montreal Lumber Association, strong objections being made to any increase in the stop-over charge beyond one cent per 100 pounds, minimum \$5 per car. The question was the subject of a further conference with the representatives of the carriers on May 16, since which date nothing further has been heard from them.

Demurrage Rates Pending Strikes

The Board of Trade Transportation Bureau made an arrangement with the Canadian Railway War Board on the subject of Canadian car demurrage rules as affected by strikes. The question arose over the strike of Montreal teamsters in April, and the following arrangement was approved by the Board of Railway Commissioners:

"In the case of delay to cars containing cartage freight other than that for delivery of which the railway cartage companies are responsible, resulting in accrual of demurrage and due to inability of consignee to release cars owing to existing strike of teamsters in Montreal, the manager of the Canadian Car Service Bureau is authorized to assess car rental on such cars at a nominal rate not in excess of one dollar per car per day when evidence is satisfactory to Manager of Bureau that consignee is entitled to such concession, is submitted by consignee. This arrangement shall continue until the expiration of five days after date of settlement of strike."

This arrangement terminated on May 5.

On April 20 the railways issued tariffs, naming rates on lumber to Montreal for export, 1c per 100 pounds less than local rates, which had the result of increasing the export lumber rates from many points beyond the advance authorized by Order in Council in the 25 per cent. advance case which became effective on August 12. As a result of the protest made to the Railway Commission the carriers agreed to re-issue their export lumber rates, which came into force on May 16.

A proposal of the carriers that collection of transportation should

be made on a cash basis, unless credit was obtained, was the subject of attention by the committee, which met the Canadian Railway War Board to discuss the matter. The result was an arrangement whereby those, whose application for credit accounts are approved, will pay their transportation charges in accordance with the following conditions: (a) All bills or accounts rendered by the carrier to consignor or consignee, as the case may be, from the 1st to the 7th of each month (both dates inclusive), shall be paid on or before the 14th of that month. (b) All bills or accounts rendered by the carrier to consignor or consignee, as the case may be, from the 8th to the 14th of each month (both dates inclusive), shall be paid on or before the 21st of that month. (c) All bills or accounts rendered by the carrier to consignor or consignee, as the case may be, from the 15th to the 21st of each month (both dates inclusive), shall be paid on or before the 21st of that month. (c) All bills or accounts rendered by the carrier to consignor or consignee, as the case may be, from the 15th to the 21st of each month (both dates inclusive) shall be paid on or before the last day of that month. (d) All bills or accounts rendered by the carrier to consignor or consignee, as the case may be, from the 22nd to the last day of each month (both inclusive), shall be paid on or before the 7th of the month following.

The Newly Elected Officers

The following were elected officers for the year 1920:

President—Geo. W. Grier, of G. A. Grier & Sons, Ltd.

Vice-president—D. H. McLennan, McLennan Lumber Co. Ltd.

Treasurer—F. W. Cotter, Dobell, Beckett & Co.

Directors—W. A. Fillion, E. H. Lemay, J. P. McLaurin, St. Maurice Paper Co. Ltd.; Geo. E. Goodfellow; S. F. Rutherford, Dominion Box and Package Co., Ltd.

The Storage of Floating Timber

The department of public works has by orders-in-council, granted to the Ontario & Minnesota Power Co. booming rights. The location of the boom extends from the canal to the canal dock at the foot of Portage Ave., Fort Frances. This necessitated the moving of the ferry of Gagne Bros. from Sinclair street to the town dock at Portage avenue. Gagne has been reimbursed by the Power Company for his expense and trouble occasioned by this change of location. The privilege granted the company only gives them the use of this water for storage of floating timber.

P. D. Gordon, Montreal,
Retiring President.

George W. Grier, Montreal,
Newly-elected President.

F. W. Cotter, Montreal,
Re-elected Treasurer.

D. H. McLennan, Montreal,
Vice-president of the Association.

What Was Doing in the Lumber Industry Thirty Years Ago

The square timber trade is almost a lost art in 1919 and was practically put out of business at the beginning of the war, yet thirty years ago it was one of the big flourishing undertakings of Ontario, and the St. Lawrence, Ottawa and other streams were dotted with huge rafts of square and waney timber on the way to Lachine, Montreal and Quebec. Many old timber men can recall interesting incidents of those halcyon days. In this connection it is interesting to read the attached paragraph from the files of the "Canada Lumberman" of the Fall of 1889:—

The Ottawa lumbermen are making preparations to go heavily into the square timber trade this winter, and the indications are that there will be more square timber taken out during the winter than for many years past. The prospect of high prices and increased demand which a short time ago was looked forward to with certainty, has not been sustained by more recent developments. Should there be an over-production, notwithstanding there may be an increased demand, it does not necessarily follow that there will be an advance in prices. While some of the lumbermen expect an advance in prices, others again are of the opinion that white pine lumber will be, at least, 10 per cent. below this season's questions.

It is estimated by different lumbermen that the square timber to be taken out in the Ottawa and Matawa districts, will be 8,000,000 feet, which will be chiefly for the Quebec market.

* * *

At Burk's Falls the pulp wood business is in a flourishing condition and shipments have set in in earnest.

Just think of the great strides in pulp and paper making since 1889. It was little thought then that this industry would so develop until to-day the annual production of pulpwood in Ontario is about 800,000 cords, and in Quebec over 1,000,000 cords.

* * *

The forest rangers employed by the government of the province of Quebec, assembled in Hull, Nov. 15, in accordance with a request from the commissioner of crown lands, to receive instructions from Mr. J. B. Charleson, superintendent of rangers, with respect to lumbering operations for the winter. Mr. Charleson pointed out that during the past year the provincial revenue from crown timber dues had increased over \$330,000 through careful watching, but remarked that rangers would succeed in stopping fires. Administration of crown lands department, he said, was purely non-political, and every employee of the department was required to do his duty, showing neither fear nor favor, and that no man who failed in the thorough performance of the duty assigned to him need expect political preferences to help him.

Another evidence of progress in 1919, as contrasted with 1889, is the advance which has been made in the protection of the timber wealth of Quebec, including four forest protective associations. Co-operation of the limit holders and lumbermen has been brought to the highest efficiency, including the modern telephone lines, look-out towers, wireless telegraphy and aeroplane patrol.

* * *

One more evidence of the advance made in hauling logs is that the tractor is now in general use as well as the motor truck, yet three decades ago it was regarded as somewhat of a novelty.

The "news" in 1889 is revealed in the following paragraphs:

Perley & Pattee of Ottawa, are about to purchase a traction engine for the hauling of logs, similar to those used so extensively in the States. The machine will be the only one of the kind in use in Canada, and is intended to do the work of horses. The engine will be used in one of the limits probably.

Perley & Pattee are about to introduce a Glover steam logger, to be used on their Petawawa limits. This is a giant machine, 28 feet long, weighing 12 tons, that can be driven by steam on a snow road, and is estimated to draw as many as 30,000 to 40,000 logs. The mechanism is simple.

* * *

One more interesting point was that the lumberman had troubles with the railway companies in 1889, the same as to-day, and a shortage of cars was complained of by a number of firms. There was also the ever-present trouble of a scarcity of logs at certain mills, particularly in the West, where a number of plants had to close earlier than usual, not on account of weather conditions but owing to not having any material for the saws.

Thirty years has wrought a great change in industry, and there are very few firms of the present day, the heads of which were in harness in the late 80's. Of course there are many old-timers, but, in looking over the list of names of those present at the various lumber and logging gatherings there are not many of those on hand thirty years ago, who attend these meetings now.

* * *

Another interesting paragraph is that "several Americans are preparing for sawmill sites in B. C. with a view to putting up mills, and that British Columbia spruce is being shipped to Guelph for use in the manufacture of organs."

To-day there are millions of dollars invested by enterprising United States capitalists in the Pacific Coast Province, and the forest products from both the Coast and the mountain regions have been spread over all parts of Ontario, many Western firms being represented directly with their own selling organizations, while practically all wholesale lumbermen in the East handle more or less B. C. wood-goods, showing how rapid has been the expansion of the last few years.

Time has wrought many other changes in the base of operations of different mills, the character of their output and cutting capacity and the scenes of logging.

* * *

The sawdust shoal in the Ottawa river, just below Bronson island, is now fully a foot over water. It is one hundred yards long and fifty wide. Several small pieces of shrubbery have been placed here and there on it to warn approaching tugs of the danger," is another news item of 1889.

One of the live topics of trouble at that time was the deposit of sawdust in the streams of rivers and an agitation was started against the mill-men, which was kept up for a number of years. To-day one hears nothing of this bugbear, as the modern burner consumes all the refuse. Thus a question that was in the air for many years is now numbered among the institutions of the past.

* * *

It is instructive to observe the trend of trade in 1889, showing a few of the ports that were active in the matter of export, and what two or three of the leading places were then doing.

"The lumber shipments of Painsboro are expected to reach one-third the whole export of the Province of Nova Scotia," says the "Canada Lumberman" of thirty years ago. Places that are not noted to-day for being large export centres were then flourishing shipping points, and many new ports in N. B. have come to the front within the last decade or two.

The export of lumber to Great Britain from the port of Richibucto for the season of 1889, amounts to 10,697,581 s.f. deals, and 7,130 pieces of railway ties containing 192,000 superficial feet. The shipments to Great Britain in 1888 were 9,151,610 s.f. deals and palings. The shipments from Buctouche to Great Britain this year are 3,387,167 s.f. deals, against 667,287 s.f. deals last year. It will therefore, be seen that the shipments of these two Kent ports to Great Britain this season was 4,265,851 s.f. deals, an increase of nearly fifty per cent. -

* * *

Other pictures of the great lumber industry, as it was in the late eighties, are presented in the following excerpts of the December (1889) edition of the "Canada Lumberman":—

* * *

Mickle, Dymont & Sons' saw mill, at Bradford, has closed down for the season. The season's cut was as follows: Over 8,000,000 feet of lumber; 4,500 cords of slabs; 3,000,000 pcs. of laths, and 12,000 pickets. They would have continued cutting until the river was frozen, but every available spot was covered, and they could not obtain cars to move the lumber already cut. Seventy men were employed in this mill.

* * *

The annual circular of the Export Lumber Company, Limited, shows the total shipments of lumber for this season from the St. Lawrence, to have been 35,313,573 feet compared with 18,089,716 feet in 1888, and 34,036,076 feet in 1887. This season's shipments were made up of 23,026,135 feet of pine, 11,738,065 feet of spruce, 33,000 feet of hardwood and 516,376 of small stowage.

R. R. Williams, Ottawa

Hugh M. Williams, Ottawa

Lieut. Thos. A. Williams, Ottawa

Greater Expansion in Lumber Line

Well Known Exporting Firm of Ottawa Believe Future is Bright — Record of Williams Lumber Co.

"We are looking forward to greater extension this coming year than any in the past. When reconstruction properly starts there is bound to be a boom in the building line as well as all others," declared R. R. Williams, of the Williams Lumber Co., Ottawa. He stated that the export trade has not been large during the past season outside of the British Government purchases.

When virtually all the available suitable lines were bought up last spring by the timber buyer for the Imperial authorities this took a monopoly on tonnage, which practically closed out private shipments of lumber.

Mr. Williams added that they had to pay during the past summer ocean freight rates over ten times higher than the charges that prevailed before the war started. Whether this move on the part of the British Government will ultimately prove advantageous or not, time alone will tell. However, we look forward for an improvement in the export trade in the near future.

Another matter which militates against export business is the exchange, as any country would, of course, sooner buy in a lower exchange market provided it can get its requirements adequately attended to.

The business of the Williams Lumber Co., wholesalers and exporters, who have offices in the Central Chambers, Ottawa, was started about thirty years ago by Hugh M. Williams, who is to-day the senior member of the firm. Later he admitted A. H. Edwards, of Carleton Place, as a partner. The latter retired in 1909, and Mr. Williams continued the business under the name of the Williams Lumber Company. In 1912 his elder son, R. R. Williams, was taken into partnership. The latter had quite an experience in the manufacturing, wholesaling and retailing lines, having been with W. C. Edwards & Co., Ottawa, the Pembroke Lumber Co., and the Chaudiere Lumber Co., Ottawa. He was treasurer and travelling salesman for the McAuliffe-Davis Lumber Co., Ltd., of Ottawa, when that firm was organized, and continued in this post until becoming associated with his father.

During the past summer Lieut. Thomas A. Williams was admitted into the partnership. He graduated in the spring of 1915 as an electrical engineer from McGill College, Montreal, with the degree of B.Sc. The same year he volunteered for active service with the 26th Battery, C.F.A., later winning a commission on the field, and was thereafter an officer with the 7th Battery, C.F.A. Although wounded three times, Lieut. Williams carried on throughout the war.

The Williams Lumber Co. is to-day composed of Hugh M. Williams, the founder, and his sons R. R. Williams and Thomas A. Williams. They have worked up a large and growing business.

Use of Seaplane in Timber Surveys

Speaking to the Foresters' Club at the Faculty of Forestry, Toronto University, Ellwood Wilson, chief forester of the Laurentide Pulp Company, Grand Mere, Que., declared that as an aid in the development of timberlands the seaplane had a great future. From photographs taken from the air, most accurate maps could be made.

While in new country Mr. Wilson predicted a great future for the seaplane; he was afraid that the airplane would prove of little use. Before an airplane could be operated with safety, landings would have to be arranged every few miles, while nature provided the landings for a seaplane. The forest lands of Quebec and New Brunswick were so thickly covered with lakes that landings abounded everywhere, the speaker said.

Lumber companies are beginning to realize the value of aviation to their business. Mr. Wilson's company was the first in his district to purchase planes. Next year there will be six seaplanes in that district.

Land which his company intended to purchase for reforestation purposes had been thoroughly surveyed from the air. Then when the deal was being put through, Mr. Wilson said, the owner found that the buyers knew more about the land than he did.

New Forestry Policy for Ontario

In the near future a deputation from the Canadian Forestry Association will wait upon Premier Drury of Ontario to urge that all timber and lumber be placed under the control of a Provincial forester, with a staff of technical experts.

It will be pointed out that from eighty to ninety per cent. of forest lands of the Province are Crown lands, are leased yearly to lumber companies, and that the public, therefore, has a direct interest with renewing the leases in 1920 or 1921, and to see that measures are taken to prevent such exploitation of timber areas as would deplete the supplies which will be needed in the future. This policy, now being followed in New Brunswick, Quebec and British Columbia, is said to be getting progressively better results every year.

It is believed that Premier Drury is sympathetic with the plan as well as for permitting the forest once more to regain its hold on lands which have been found unsuitable for agricultural purposes. It is understood that the idea of the Canadian Forestry Association is that anybody given control of the forest wealth of the Province and supervision of cutting by companies, should have three or four Government appointees and two representatives of the lumber industry, so that the object in view might be obtained by co-operative action.

Fassett Co's Mill Now Sawing Hardwoods

The Fassett Lumber Co., Fassett, Que., whose plant has been shut down since the 1st of November, recently resumed operations, and will saw hardwoods this winter. Repairs were made to the mill and two sets of steam set works were installed. The company report that sales are especially good and there is a keen demand for hemlock. The cut of the company this season will be about 27,000,000 ft., 7,000,000 ft. of which will be hardwood. They have also about 5,000 cords of pulpwood and 1,000 cords of hemlock bark. The company contract for their logs direct with one concern, which, in turn, sub-lets to jobbers. The price per thousand this year is just double what it was in pre-war days. As the Fassett Lumber Co. operate their own railroad, they state that their costs are not in proportion to other operators who drive their logs and have to haul their supplies from long distances. Wages are higher than they were last year at this particular period, and men are plentiful in the district, while work is farther advanced than it was in 1919 at this time.

Ontario Retailers Will Convene in Hamilton

The annual meeting of the Ontario Retail Lumber Dealers' Association will be held at the Royal Connaught Hotel, Hamilton, on Tuesday and Wednesday, February 10th and 11th. This is the first time in the history of the Association of a two-days' convention as heretofore the gatherings have been for one day only. It is felt, however, that one day is too short to dispose of the many important matters that will come up for consideration at this particular session, and two days will prove more acceptable all around.

An active membership campaign has been started and each of the 160 members is expected to secure at least one or two new recruits before the February meeting. An interesting program is being prepared and, incidentally, there will be the usual social features. President Thomas Patterson, of Hamilton, gives assurances that all visitors will be given an enthusiastic welcome, and it will well repay any member of the trade to spend two days in conference with his fellow lumbermen.

Last February the convention was held in Toronto and was a splendid success, and it is expected that the gathering on February tentative and enthusiastic in character.

Busy Conditions in Lumber Line

The Labor Gazette of Ottawa in its review of conditions in lumbering for the month of November says:—Charlottetown reported a quiet month. The saw and shingle mills at St. John and Fredericton continued steadily in operation, while towards the end of the month many men were taken on for work in the woods. At the end of the month lumbermen at Quebec were also leaving for the woods. River-driving was concluded for the season, and the saw and shingle mills also approached the end of their season's operations. Sherbrooke reported activity in the camps for timber, ties and poles, also in the saw and shingle mills. Ottawa and Hull reported a scarcity of labor for the lumber camps, several hundreds of shanty men who went to the war having drifted into other occupations on their return. Sawmills had a busy month. Peterborough reported continued activity in the sawmills and many men leaving for the lumber camps. Two shingle mills were idle at Owen Sound, but the sawmills were active and the planing mills and lumber camps were busy. A serious shortage of skilled men was experienced in the lumbering operations at Sault Ste. Marie. At Port Arthur and Fort William the lumbering season opened with strong demand for lumbermen, and it was estimated that 1,500 inexperienced men could be placed in the camps immediately west of Sudbury, pay being \$55 to \$60 per month. Fernie showed great activity in preparing for extensive work during the coming winter. Important deals took place, insuring, it was said, a revival of the industry for at least ten years. Vancouver reported lumbering and shingle manufacturing good with steady employment expected during winter. At Victoria the lumber industry continued brisk.

Fire Assessors Entitled to Compensation

Mr. Justice Tellier, in the Superior Court, Montreal, maintained the action of the Compagnie d'Arbitrage de Montreal against Wilfrid H. Pauze, lumber merchant, Montreal, for a sum of \$802.40, for services rendered as assessors of the defendant's loss by fire in his lumber yard on November 21, 1917. The company plaintiff—composed of Joseph Odilon Dupuis, Alexandre Deschamps, Ludger Clement, and Wilfrid Gadoury—said that it was agreed they should be paid two and a half per cent. of the amount payable to defendant by the fire insurance companies. After a careful assessment it was found that \$32,095.44 was recoverable, and this sum was duly paid by the five insurance companies with which defendant held policies.

Plaintiffs claimed \$802.40 as two and a half per cent. of this amount, but defendant objected that the claim was too high. He pretended that he was liable for only one per cent., but to avoid litigation he offered plaintiffs \$322. This was refused, and in deciding the issue Mr. Justice Tellier said that a proper and careful valuation of the defendant's loss was made by the plaintiffs, and defendant accepted their finding without complaint at the time, and which offer he renewed with his defence—he made no objection to the manner in which the work had been done. His only complaint was that their fees were too high.

In the absence of a special contract fixing the amount of their remuneration, plaintiffs had a right to be paid in accordance with the value of the services rendered and on the basis of the tax generally applied for work of this nature. In the light of the proof, the tax of two and a half per cent. appeared to be proportionate to the value of the services rendered, and did not exceed what assessors in cases of this kind were allowed as a general practice. Moreover this tax of two and a half per cent. appeared to be proportionate to the value of the services rendered, and did not exceed what assessors in cases of this kind were allowed as a general practice. Moreover this tax was exactly what defendant agreed to pay to plaintiffs, and had

paid, for services of a like character after a fire that had destroyed his property previously.

Judgment was accordingly given for the plaintiffs for \$802.40, with costs. (4839, S.C.M.)

New Regulations in Timber Cutting

The Woodlands section of the Canadian Pulp and Paper Association and the Quebec Timber Limit Holders' Association have jointly appointed the following advisory committee in connection with the proposed changes in the regulation of lands and forests governing the cutting of timber on Crown lands:—Messrs. W. Gerard Power, Ellwood Wilson, R. P. Kernan, and G. C. Piche. Negotiations on the subject are proceeding with the Minister of Lands and Forests.

Lumber Sheds Should be Waterproof

I saw the unloading of a truck load of oak flooring the other day. It came from a shed where the rain had beaten in on the end of the pile. About 500 feet was laid aside so badly stained on the ends that they would have to be cut off, entailing a loss of probably \$25.00 or more. You know what quarter-sawn white oak flooring is worth now, don't you? Most of you have open-faced sheds, and some of your stock that has been in them for some time has become more or less damaged by the driving rains, especially at the bottom of the piles. If there have been traces this summer of a leak in the roof it will be worse when the wet snow lies on it. You should go carefully over your whole stock and examine the buildings before winter sets in. Clean up the whole yard, both in back and front of the piles. Clean out the accumulated dust on the upper deck of your sheds and molding racks. When snow drives in and melts, the wet dirt will injure your timber. There is no yard but what needs a housecleaning before winter, for, as it lays out in the open it catches all the dust and trash blown by the winds, and makes it the dirtiest place in town unless cleaned out frequently.

We have got to take more care of our lumber and buildings than we have been accustomed to; likewise everything else we use. Everybody is going to be forced to have, whether it is his natural inclination or not. Eventually the farmers even will see with an understanding eye that they are losing money by not putting all their working implements under cover. They will see this more and more as they come to understand the computation of the cost of raising their products. The same rules of business apply equally to them as with the town merchant.—Mississippi Valley Lumberman.

Piecework in Logging Operations

The lumber industry has been behind nearly any other manufacturing industry in the proportion of piecework employment to the older system of day wages. The last year or so, however, has seen a very considerable introduction of piecework methods and particularly in logging activities. This branch of lumber manufacture appears to lend itself more particularly to this system, because the individual output is more directly a factor of individual exertion. In the operation of a sawmill the edgerman or trimmer or any of those who work with the product after it leaves the saw carriage can not handle more product than comes to them in the routine process. The volume of output of the mill rests almost entirely with the sawyer and carriageman, says the "American Lumberman."

In the woods, however, the sawyers, swampers, skiddermen and teamsters are "on their own," to use an expressive English idiom. The necessary increase in wages when it came did not bring increased production, and piecework rates have been adopted as the only expedient against seriously rising unit costs of production. Under the piecework rate men have been able to maintain or in some cases very greatly to increase their earnings, doing this, however, through an increased production which has kept the unit cost per thousand feet within reasonable limits. To this plan there have, however, been certain drawbacks. At the Northern Logging Congress one superintendent stated that his men were able to stand their increased rate of work only for three or four weeks, when it became necessary for them to lay off and rest up. Most operators also have preferred to keep teamsters on a monthly wage, not caring to have their own horses overdriven through a piecework incentive.

The piecework method does promote increased individual production where properly applied. In many lines of manufacture it has a detrimental effect upon the quality of product. Unless controlled by proper inspection the piece rate worker is inclined to slight his work. This difficulty is, of course, greater with finished manufactured product than in the cruder operations which go to make up logging.

It is quite probable that a piecework system will be more widely introduced in the next few years in all lines of work where the character of the work gives an opportunity for increased individual production. Its possibilities at least are sufficiently interesting to be worthy of careful consideration.

Hardwood Flooring—"From Forest to Home"

*Enterprising Canadian Firm Present Moving Picture Story of Their Industry—
Views are Instructive and Tell People how Product is Manufactured*

Frank A. Kent, Toronto.

The educative value of moving pictures is being extended in all directions and many industries which heretofore have been known to the general public in name only are now being brought to our very doors and pictorially presented. Films of logging, lumbering and general driving, towing and sorting operations on the way to the sawmill have been displayed on the screen from time to time. The process of showing in every detail a closely allied industry—the making of hardwood flooring—from the bush to the ball room—has just been effected by the Seaman, Kent Co., Limited, of Toronto, who control the output of five plants, the largest of which is located at Meaford, Ont. Pathe-scope of Canada, Limited, 156 King St. west, Toronto, have

been engaged in the work of preparing these films for some months, and the "premiere" was given in the Star Theatre, Meaford, recently, before a large and delighted gathering. The production of "Beaver Brand" hardwood flooring, was depicted in a most comprehensive series of views, and the title of the series of films is "From Forest to Home."

It may be stated that the Seaman, Kent Co. are exceptionally busy at the present time in an effort to keep up with the demand for hardwood flooring of all kinds and lately purchased the West Lorne Wagon Works at West Lorne, Ont., where the buildings are being extended, and the most modern equipment installed for turning out oak flooring exclusively. Owing to the heavy domestic call for maple, oak, beech and birch flooring a large number of orders from the Old Country have had to be declined.

Cutting and Skidding in the Bush

The moving pictures begin with a scene from the forests on the Christian Islands, taken last winter, and show a gang of workmen felling the typical Canadian maples and skidding them in the woods ready for transportation to the saw mills where they are converted into lumber. In many instances the logs were hauled to waterways and put in big booms and towed to the mills. At various dumps some 20,000 hardwood logs were seen awaiting transportation at some point on the Georgian Bay. Upon arrival at the mills, the logs are taken from the water and immediately sawn into lumber of standard lengths and thickness. By labor-saving devices such as chains, carriers, etc., these logs are brought into the mills from the water very quickly and with a minimum of expense. The lumber is placed on trucks and drawn and piled at convenient points for re-handling by water or rail.

The lumber is then ready to be taken to the flooring factory and a boat in the course of loading was shown, which later was unloaded at the Meaford docks by the company's men and men about town. The lumber was later teamed from the docks to the lumber yards and dry kilns.

The manufacture of the real "Beaver Brand" kind of flooring commences when the lumber is put in the kilns, where it remains for at least 15 days under a temperature of from 160 to 200 degrees. Perfect drying is essential to good flooring and great care is taken to see that the flooring gets properly "cured" and away to a good start. When bone dry the lumber is planed and sawed to the desired width and thickness, after which it is tongued and grooved as well as hollowed to prevent warping. The product is so closely matched that it is nearly impossible to see where it is joined. The strips are then conveyed to the end matchers where they are so well end matched that they fit perfectly and avoid waste in laying. The flooring is then sorted into proper lengths and is tied firmly in bundles for quick handling and shipping.

The firm also have a factory at Ste. Agathe, Que., which spe-

cializes in hardwood flooring. It is also well equipped and takes care of much Eastern business enjoyed by the company. The premises are not as large as the plant in Meaford, but the product is the same.

How Hardwood Floors are Laid

The next important step in the production of perfect flooring is the laying and in the films workmen demonstrate that the floors are well and truly laid. The matching is the "corner stone" of Beaver Brand flooring and in the production of the material three parts of the trouble of laying is entirely eliminated. Many scenes of dance halls are given as well as parlor floors where entire satisfaction is witnessed with highly polished floors.

The plant of the Seaman, Kent Co. at Meaford, has been operated for nineteen years and the company state they are the largest producers of hardwood flooring in the British Empire. The industry at Meaford now has a capacity of 2,500,000 feet of finished flooring per month, and has now in its employ some 375 hands including both factories and its selling and office force. It is the pioneer flooring establishment in the flooring industry and has already placed orders for additional machinery to extend operations. The wages expended

One of the two large plants at Meaford, producing hardwood flooring for Seaman, Kent & Co., Limited.

each month in Meaford exceed \$10,000 and with orders now on the books for overseas delivery the firm are advertising for sufficient men to run two shifts per day.

The Seaman, Kent Co., have also placed orders with the Knight Manufacturing Co. to manufacture flooring and some 20 or 30 hands are now operating on flooring in this concern. This addition is likely to continue and may possibly be doubled in the near future.

The company are advertising in the press for hardwood lumber or logs, delivered at Meaford, or at mills within ten or fifteen miles of the town where sawing can be arranged. It is expected that operations will commence in their new plant at West Lorne, Ont., early in 1920. The capacity will be 8,000,000 feet annually. New dry kilns have been built and the very latest equipment installed.

Frank A. Kent of Toronto, managing director of the company, states that with their five plants in operation, the Seaman, Kent Co. will be the largest producers of hardwood flooring in the world. The moving pictures which have been taken and perfected will be shown in all the provinces of Canada through the medium of the film exchanges, and later on it is expected the series will be exhibited in the Old Country and Europe.

Model New Sawmill Erected at Matheson

The new sawmill of the Matheson Lumber Co. at Matheson, Ont., is nearing completion. It is 84 ft. long by 22 ft. wide, with boiler room and trimmer building attached, concrete pillars under mill and heavy concrete floor in boiler room. The company estimate that they will cut somewhere about 25 M. feet per day, with circular saw. They are installing steam feed and steam nigger, and, when completed, the mill will be one of the most modern and up-to-date small plants in the north country. The Matheson Lumber Co., of which R. S. Potter is President, plan on cutting a million and a half feet this coming summer. They commenced their log operations about a month ago and have several men working in the woods. The company have a couple of small limits on the Black River.

Veteran in the Lumber Industry

J. F. Lillicrap, Lakefield, Ont.

"I have managed the lumber business from almost every angle and always find something to learn," stated J. F. Lillicrap, of the Kawatha Lumber Co., Lakefield, Ont. He is one of the most widely known members of the industry in Ontario, having been identified with it for over forty years. Mr. Lillicrap got his first acquaintance with wood products when a clerk in a lumber camp in the township of Harvey, Peterboro County. He kept the books and also the time of the men, measured all the logs and square timber, and for discharging these manifold duties received \$12 per month. The wages that prevailed that winter for lumberjacks were \$9 to \$14 a month, a foreman received \$25 and cooks \$20. The board consisted of pork, beans, bread and tea without any

sugar, and few, if any, potatoes. How different is the menu today!

Until 1882 Mr. Lillicrap measured logs in the winter and then was placed in charge of a large sawmill at Bradford, Ont., where he spent the summer for some years, and during the cold months estimated timber on the limits, located camps, etc. He returned to Lakefield about 1887, where he was employed by the Lakefield Lumber Co., looking after their sawing and shipping. Then for three years he operated a planing mill in that village and, in company with Mr. Tate, built and operated a sawmill which they sold in 1909. Mr. Lillicrap next commenced to sell lumber on a commission basis and also to purchase for an American firm. In 1912 he came to Toronto to sell for the Laurentide Lumber Co., of Montreal, but returned to Lakefield in 1917. A year ago, in association with his old partner, E. R. Tate, and G. Elmsley, of Toronto, he formed the Kawatha Lumber Co., Limited, of which he is purchasing agent and salesman. They have had a successful season and expect to largely extend their business next year.

Mr. Lillicrap has made many warm friends during his long connection with the industry and has witnessed many changes in its development during his forty-three years' association with its activities.

Last Block Firm is Very Active

George Willard & Son, of Masonville, Que., who recently purchased the mill and timber limits belonging to the Stewart Estate, will make use of the mill for sawing lumber. They do not expect to employ the output in their business of making last blocks, but intend to work up what soft wood comes from their limits for their own purpose in building camps, keeping up repairs, etc.

The firm have been making shoe last blocks since 1903, doing all work by hand in the woods, and gradually coming to the use of machines run by power. All trade at that time being with the Canadian market, Willard & Son soon discovered the advantage of doing this work with saws driven by steam, and this led the way to rough turned, air dried blocks, which is the principal product of their plants at the present. The firm operate three mills for the manufacture of last blocks, shoe tree blocks, toe pieces and rubber blocks. Their mill at Traver Road, Quebec, has a capacity of 4,000 pieces a day, the one at Bolton Centre 2,500 pieces, and the one at South Bolton the same. The European market which the firm held before the war quickly came to its own as soon as shipping would allow it and is now very keen. About fifty per cent. of the trade of Willard & Son is with the New England States, which abound in shoe factories.

Want Pacific Coast Soft Wood

Australia's need for soft wood for all sorts of commercial purposes, formerly supplied from the Baltic seacoast, must henceforth be met by the Pacific coast, which has ousted the Baltic from the Australian market, said Mark A. Sheldon, commissioner of the Commonwealth of Australia, in an address before the chamber of commerce in San Francisco.

"There is one line that must go on increasing and increasing, and that is the lumber business," he added. "We have no soft woods in Australia. Our woods are heavy and hard, and we want Pacific coast soft woods."

May Build Cargo Vessels for France

Canadian shipyards may have an opportunity to build cargo vessels for the French Government, according to reports in circulation in Ottawa. France, it is said, is anxious to buy or have constructed freight carriers to ply to her colonies, to operate on the Mediterranean, and to build up her commerce generally. If arrangements could be made, it is reported the French Government would be prepared to spend \$180,000,000 upon ships of all sizes to the number of more than a hundred, and to pay as much as \$170 a ton for them. It would be glad, moreover, to place orders for vessels in this country. Not long ago Hon. C. C. Ballantyne was reported to have told a deputation that Canada, if she wished, could dispose of all the vessels built under the Government construction programme at satisfactory rates. It is now surmised that France would be glad to buy those ships, all of which are of a very high class.

Recently orders for two more ships for the Dominion Government were awarded to the Wallace Shipbuilding Company, of Vancouver, at a price several dollars a ton below \$170. J. Coughlan, of J. Coughlan and Sons, of Vancouver, was in the capital seeking orders for two vessels to fill two berths which will soon become vacant at the company's yards.

Progressive Firm Erects New Office Building

Messrs. Millen & Frere, of Montreal, have recently completed a very fine office building in connection with their yards in the north end of the city. This enterprising firm now have attractive executive quarters quite in keeping with their industry and growth, and that are not only a credit to themselves, but to the retail lumber business of Montreal. The building is a two-storey brick one, with concrete basement, and the interior is finished in panels of B. C. fir. The ceiling beams are artistically boxed in and moulded and the entire inside trim is finished natural. The floors are native birch. The office furniture will be made of fir and the whole effect is not only pleasing but will prove a considerable boost for B. C. fir.

New Sawmill Erected in Peterboro

E. H. Mann & Company have erected a new sawmill on Otonabee Street, Peterboro. It is equipped with circular saw, edger and trimmer, and will manufacture all kinds of lumber. There has also been installed a shingle machine for turning out heading and shingles, while another department will produce lath. The output of the mill will be about 18,000 feet of lumber a day. The building is 24 x 84 ft. and it is expected that operations will start in a few days. Mr. Mann has been in the lumber and planing mill business in Peterboro for many years, and is well known to the trade throughout the Midland district.

Finger Lumber Company Sell Interests

The biggest deal in the history of the lumber business in the province has just been negotiated, the Finger Lumber Company having disposed of its 324 miles of timber limits in The Pas district, Manitoba, for \$1,500,000, to C. J. and D. N. Winton, of Minneapolis. This includes a large sawmill, planing plants and logging equipments. The deal becomes effective at once and possession will be taken within a month. H. Finger, head of the retiring company, is a pioneer in the North Country, going to The Pas in 1904, when it was Indian territory. Now the capacity of the company is about 190,000 feet per day.

Canadian Lumber for Japan Market

Writing from Yokohama, Japan, Canadian Trade Commissioner A. E. Bryan says:—Up to the present Canadian lumber has not been imported into Japan in very large quantities, compared to what one would think should be the case. The reason for this is that the Japanese forests have so far been not only supplying the domestic demand, but a certain quantity has been exported as well in the form of logs, railway sleepers, shooks, matchsticks, etc.

It is said, however, that the now available Japanese forests are pretty well exhausted. Most of the forest land of the country is owned by the Imperial Household, and is not allowed to be cut. Only just lately, a forest concession was given over to be cut on account of the available supply of lumber being so low.

Although small parcels of lumber are coming forward from British Columbia quite regularly, it is to be assumed that these will greatly increase in quantity as time goes on. It is of interest to note that one large importer in Kobe told the writer that in his district they always reckoned Canadian lumber as better graded than the American product.

Retail Lumberman Gets Small End of Profit

Carries Larger Stock, Gives Better Service and Works Longer Than Ever Yet is Making Less—District No. 6 O.R.L.D.A. Considers Timely Questions

Matters of vital interest to the retail trade were discussed at the annual meeting of District No. 6 of the Ontario Retail Lumber Dealers' Association, which was held in Orangeville, Ont., on December 5th. Notwithstanding the unfavorable weather there was a representative attendance, and the interchange of thought and opinion on stocks, deliveries, grades, collections, competition, merchandizing methods, cost accounting, profit figuring and other kindred subjects proved to be highly satisfactory and instructive. For nearly three hours the members, who gathered in the Orangeville Council Chamber, had a heart-to-heart discussion. It was a sort of round-table conference, in which everyone took part and expressed his views freely.

One particular feature that the meeting brought out was the scarcity of stocks, particularly in hemlock, the shortage and abnormal demand for shingles, occasioned by the recent severe wind-storm in Ontario, when many barns and other buildings were unroofed, and the necessity of securing a fair margin of profit on all materials handled. It was stated that a retail lumberman was doing more work, carrying larger stocks and giving better service to-day than at any period in his history, yet he was earning less money and winding up the year with a smaller sum on the right side of the ledger.

This, one of the members stated, was due to the fact that they were not conversant with their actual costs of doing business, and did not know how to compute profits properly.

Another member declared "we are too fond of exchanging an old dollar for a new one, and there is no satisfaction in that. We buy our lumber for a certain sum and sell it at a certain figure, and think the difference represents profit, when in many cases, considering the prices we have to pay to replenish stocks, it really means a loss. I do not see any particular merit in turning over a stock without being able to make a little money in the transaction, and that is what we have not been doing for a long time. When the market is advancing our prices should be on the basis of current quotations rather than on what the material cost when it was put into our yards.

Retailer Entitled to Better Profits

"Yes," spoke up another member, "we work long hours, have to invest a large amount of money in stock, handle it in small quantities and give the best of service and material, and at the end of the year have little to show for our work and worry. The retail lumberman is entitled to a better profit and should get it, and the sooner he institutes aggressive business methods, the better for him and his future. I believe that the manufacturer and the wholesaler are making all the money that is being cleaned up to-day in the lumber

business. It is certainly not the retailer, and I know whereof I speak."

In the discussion it was stated that some dealers were handling cements, and that they had not been protected by the cement manufacturers, who also sold to contractors, but lately, owing to an agitation carried on, the companies had decided to give the retail merchants a slight concession on each sack, so as to make it worth while stocking this material.

The question of closer relations with the farmers, the matter of extending patronage exclusively to those lumber firms who protected the interests of the yardman and did not sell shingles, lath or other supplies to hardware men, blacksmiths, waggon makers, etc., was endorsed. Retail men will naturally support those who stand by the legitimate interests of the trade, and recognize that the yard man is the best, most satisfactory and all-round available means of distribution.

The question of drawing up some recommendations in regard to better and more uniform grading of lumber was discussed, and some instances were pointed out of the very wide difference in interpretations placed by certain firms upon certain grades of stock and what percentage of good stuff a car should contain. At present there are too many confusing terms without any recognized exact application, and the term "merchantable" had been extended in meaning until it practically took in everything except read culls and scoots. It was, however, deemed advisable not to make any recommendations on this point at the present time in view of the scarcity of stock and the fact that deliveries have been rather slow on a number of lines.

The Provincial Gathering in Hamilton

Other live matters discussed were collections, a uniform order form, shipping arrangements, cost of unloading cars, the best method of keeping stock, the Ontario Business Assessment Act, the Mechanics' Lien Act, etc. On some of these questions a definite decision will be reached and brought up at the annual convention of the Ontario Retail Lumber Dealers' Association, which will be held in Hamilton on Tuesday and Wednesday, February 10th and 11th. It is expected that this will be the most representative and interesting meeting ever held in the history of the retail lumber industry of the Province.

One member declared that it might be thought building would stagnate owing to rapidly rising values, but his experience has been that the higher prices went the more activity there generally was in the building line, for the simple reason that there always seemed a large class in any community who did not undertake anything in structural operations until the peak was reached, and then they sud-

J. A. Matthews, Orangeville, Ont.,
Re-elected Chairman.

Udney Richardson, Elora, Ont.,
Member of Committee.

J. B. MacKenzie, Georgetown, Ont.,
Re-elected Secretary.

denly grew very active. It is not thought that the apex of prices has been attained yet by any means, and it is felt that 1920 will be a greater building year than ever. One member from a town of two thousand population stated that indications pointed to the erection of at least fifty dwellings in his burg during next spring and summer.

Among those who delivered addresses was Mr. H. Boulton, of Toronto, secretary of the Ontario Retail Lumber Dealers' Association, who expressed his gratification at the representative attendance, and dwelt upon some of the good results that had been accomplished through organization and co-operation.

Continuing Mr. Boulton said: We are drawing rapidly towards that delightful season of the year when it is the aim of every person in the Christian world to treat himself to the pleasures growing out of someone else's happiness. The spirit of Christmas is nothing more or less than the spirit upon which our Association is founded. You may say that in co-operating with your fellow retailers you are really actuated by a belief that in so doing you are benefiting yourself and therefore the motive is selfish. But the same thing could just as truthfully be said of the generosity which you display in making your Christmas gifts. It was ever more blessed to give than to receive, and in Association work every effort you make to show the light to your competitor will pay you many times its cost.

Concrete Advantages of Fellowship

After two years of work in connection with the Ontario Retail Lumber Dealers Association, I am still in doubt as to which is the more important result of our efforts—whether it is the concrete advantage to individual members which can be measured in dollars and cents, or the less tangible, but none the less important benefits which accrue to those members who take their Association seriously and reap every advantage they can from the friendships they are thus enabled to secure with those who in former days they looked upon as competitors and therefore enemies.

Possibly this is about enough along this line, but just to drive the point home a little more definitely, let me ask you to look back upon the feelings you had when coming to Orangeville for the meeting a year ago, and to compare them with the feelings you experience to-day. I am satisfied that, no matter how hopefully you may have looked forward to the betterment of trade relationships, you did not indulge in any hopes which to-day can be shown to have been extravagant. You have got rid of the feeling that some of your fellow dealers were not to be trusted, and you have, during the year, co-operated with one another, both informally and at meetings, in a manner which has made your business more pleasant and more successful.

The dealers of this district are to be congratulated upon having formed the first local branch of the Association. Your example has been followed by the dealers of another district who hold their meetings at Stratford. Undoubtedly the formation of these local branches will, in the long run, be the most important factor in the progress of the general Association. It is in the local meetings that the interests of the members are most clearly related, and it is from the local meetings that the suggestions and the inspirations must come that will make for the success of the General Association.

Industrial Relationship of Branch

You should take your relation to the local branch as seriously as possible. It seems to me that there ought to have been more meetings of your branch during the year than there have been. This is by way of suggestion, not criticism. It is more than likely that during the early years of the life of a local branch, the members may, in a sense, feel that they are experimenting and that they will know better how to proceed a year or two later. It is a natural enough feeling, but it does not make for big results. The meetings which I have been able to attend, up to date, have convinced me that the greatest results secured are not the tangible ones, but the personal and intangible ones which elevate your self-respect and improve your appreciation of the good qualities in your fellow dealers. This is why it seems that your branch would have done well to have held more frequent meetings during the past year. Don't let the idea get hold of you that a meeting is not important because very little is done that requires an entry upon the minutes. This thought is likely to creep in as time passes, unless you meet frequently and break through the shell of reserve which forms so quickly around persons who abstain from intercourse with one another. Even a meeting of a half a dozen or so members of a local branch does good. If there are a few definite problems of the trade which require discussion, all the better, but even with an informal programme of friendly discussion, it is possible to make these meetings an inspiration for better business methods after the return home.

This meeting should not confine itself to the presentation of a few reports, the election of officers and an adjournment until the next

meeting, possibly several months away. When you have the officers' reports and elections disposed of, I would suggest a discussion of some of your more intimate local problems, such for instance as the education of anyone who may be too fond of cutting prices below cost. If you have a few of these fellows in the district, why not plan out a campaign to show them the light. You will never do much with such men by an occasional call upon them. You ought to make a dead set on them. Every man in the district ought to go after them whenever possible, and either get them to do business on a sound basis or make them feel ashamed of themselves. The trouble with these fellows is that they don't feel ashamed of themselves at all. They think they are the only smart ones in the business and that all the others are "out of step."

Looking Ahead in Trade Matters

You ought to indulge also in a talk about trade conditions. If you had been able, a year ago, to analyze market conditions properly and had gone ahead and bought good-sized stocks of lumber, you would have made a good thing out of the splendid demand which developed during the present year. You can devote a lot of thought to this subject now, and possibly help one another to see ahead a little more clearly and to decide upon your buying policy for next year. There are indications to-day that the building activity of 1919 is only a forerunner of greater activity in 1920 and that the available stocks of lumber will be in great demand. These are matters which concern you and your bank accounts very closely. Some of you may hold opinions on the subject which are not shared by others. These opinions ought to be brought out and exchanged, so that the best thought on the subject may be available for all.

I don't want to take up much of the time of this meeting, as the dealers present need one another's help more than mine. The work of our Association during the year had been important and productive of results and I could spend an hour or two telling about it. But these are matters which will be best reported at some length at our Annual Meeting. February 10th and 11th are the days which have been selected for the Annual Meeting and it will be held at Hamilton, the home city of our President, Mr. Thomas Patterson.

This meeting of Branch No. 6 comes at a good time to remind you of the Annual Meeting and urge you to do everything you can to make it a success. In a few days you will receive a copy of a circular letter, from the Association, the object of which is to get every member working on a plan for starting next year with a record membership list.

Getting the Other Fellow to Join

Each member is being allotted a few names of prospects for membership and being asked to make a dead set upon them and get them to join the Association. We have nearly 160 members now, but we ought to have twice that number and we can get them if every member puts the right amount of enthusiasm into the work.

One of the chief objects of these branches of the Association is to enable the local members to make more effective use of the general Association. While the members we have, have been pretty keen about the work of the Association, they might have made a great deal more use of it than they have. Some members have been quick to realize the benefits of the service they can get out of the Association, but others have been content to sit back and wait to see results manifest themselves without being gone after. We have been feeling around more or less during the first two years of our existence, and we have learned a great deal about what we can do. From now on we should plan for bigger results. The only way in which this can be done is by getting the local branches to stir things up and force the General Association to take up all those matters which will be to the general interest. I would like to see the members of this district come to the Annual Meeting in a body with a well-mapped out programme of things which they intend to have the Association take up.

Preliminary Action to Get Results

Take, for instance, such matters as plan books, standard sizes, standard moulding designs, standard order forms, standard forms for making claims upon the railway companies, even standard grades for lumber, to say nothing of matters relating to trade ethics. Why not make a list of such matters at this meeting and discuss them one by one, then go to the general meeting prepared to bring them up for discussion and have real action taken. Most of these things have been discussed at one time or another during the past two years and it is time now that on some of them we stirred up enough interest to get action.

It will help to make the Annual Meeting a success if your members will follow this suggestion and have a cut and dried programme ready and make yourselves known at the Annual Meeting by the persistent way in which you stir things up.

Moreover, we must get many other local branches organized

and I think things are about ripe for starting several of them. The example you set at the Annual Meeting by keeping things going, as I have suggested, will be infectious. You will get results out of it. You will be known as the liveliest portion of the Association and the results that grow out of your enthusiasm will go a long way towards stirring up the rest of the members of other local branches, and in the end make the Association more nearly the important organization that the members should all want it to be.

An address was delivered by J. A. Matthews, of Orange-

W. G. Gorvett, Arthur, Ont.
Member of Committee.

Eugene Murphy Jr., Mount Forest,
Member of Committee.

ville, chairman of the district, who warmly welcomed the visitors, and entertained them to dinner.

G. B. Van Blaricom, editor of the "Canada Lumberman," also spoke, touching particularly upon the benefits resulting from association work, and also the annual outings of the Ontario Retail Lumber Dealers' Association. The spirit of good fellowship which characterized these, as well as their educational value and broadening effect, were pointed out.

The Old Officers were Re-elected

All the officers were re-elected for the coming year, Chairman, J. A. Matthews, Orangeville; vice chairman and honorary secretary, J. B. MacKenzie, Georgetown, Ont.; committee, Udney Richardson, ex-M.P.P., Elora, W. G. Gorvett, Arthur, Eugene Murphy, Jr., Mount Forest, and John Howes, Harriston. It was declared that they had done their work worthily and well during the past season, and that the district was one of the liveliest of any in the Province.

It was decided to hold the next sitting in Toronto during the last week in March, and every member promised to be in attendance. Several matters arising at that particular season of the year will then be taken up.

Among those present at the meeting were J. A. Matthews, Orangeville; J. B. MacKenzie, Georgetown; A. Henderson, Cheltenham; Robert Dixon, Grand Valley; Udney Richardson, ex-M.P.P., Elora; John Howes, Harriston; W. G. Gorvett, Arthur; H. Boulton, Toronto, (Secretary of the Retail Lumber Dealers' Association), and G. B. VanBlaricom, Toronto, (Editor "Canada Lumberman").

Both Good and Evil Institution

Speaking of the transit car problem, the "American Lumberman" says: Briefs of opposing counsel representing lumbermen who favor and who oppose the per diem charge of \$10 a day on cars of lumber held for reconsignment more than forty-eight hours are presented. It is not necessary to review at length the argument pro and con, inasmuch as the briefs are not so abbreviated as the word might imply. An attempt, however, is made in the brief of the National Bureau of Wholesale Lumber Distributors to discuss the subject from a broad economic basis, and a little analysis of that side of the question may be useful.

The brief describes the normal and legitimate function of a wholesaler in gathering up lumber from small mills and finding the buyers for it. It seems to be assumed as axiomatic that the transit car privilege is essential for this purpose. The argument is made that the practice brings the car closer to the consumer at the time he is in the market for it. This is undoubtedly true; but it of course is not true that the average retail lumber dealer can safely let his stocks run down depending upon being able to buy a transit car of lumber

of just the kind he wants at the time he wants it. To some extent in the main yard stock items it enables the retailer to do business with a somewhat lower stock on hand.

The claim is made for the transit car that it is a strong factor in keeping the prices of lumber down. The investigations of the United States Forest Service and the Federal Trade Commission into the economics of the lumber business do not suggest that that is any great virtue, averaged over past years, inasmuch as overproduction and overcompetition have often over long periods produced selling prices that were unprofitable and demoralizing. It may well be that the transit car privilege has been a factor in such situations in the past, inasmuch as it has always been with us. No one having the knowledge of the facts would, however, seriously argue that if the case had been otherwise the conditions of market depression would have been transformed into an unreasonable price inflation.

With the brief was put in an exhibit showing average prices for transit car shipments of \$40.94 over a period during which the average list of the large mills for mill shipments was \$47.48. It is not clearly apparent from these figures that these transit cars were actually bearing the market. There is a material difference in average value between the simpler product of the small mill and the more highly refined and millworked product of the large one.

The transit car is in fact both a good and an evil institution. Confined to its proper legitimate purpose it is a trade convenience, which, however, does not in any such great measure as is sometimes claimed rise to the dignity of a trade necessity. It is, however, subject to abuse and then becomes an economic evil.

In this present case, however, there is no question of doing away with the transit car. The only question is whether those who handle it shall be permitted to hold it indefinitely for reconsignment or whether this pre-reconsignment period shall be limited to forty-eight hours with the \$10 a day charge for a longer period.

Increasing Lumber Trade With West Indies

T. B. Macaulay of Montreal is an energetic and persistent advocate of greater trade relations between Canada and the British West Indies. He is of opinion that Canada can supply many of the commodities which the West Indies now purchase in the United States, and that Canada can find in the West Indies sources of supply for which this country is now dependent on the United States. The remedy for this condition is commercial union. Mr. Macaulay asserts that further preference is a necessity. In addressing the members of the Montreal Board of Trade he declared that the United States aims not merely at commercial control of the West Indies, but hopes to annex them politically. He had strong reason to believe American interests were at work in Jamaica to influence public opinion in favor of union with the United States. Closer relations of Canada and the British West Indies is to-day as virtually necessary to the Empire as the union of the provinces of Canada was fifty years ago. Immediate action is imperative. To maintain the commerce of the Empire, and thus maintain its financial independence, the Empire must be commercially consolidated. Lumbermen are, of course, interested in this question as wider markets are of importance to our industry. Canada already does a considerable lumber trade with the West Indies, but there is every reason to believe that the volume could be largely increased if closer commercial union could be arranged.

New Wholesale Lumber Firm in Montreal

A new wholesale lumber firm has been formed in Montreal by Lieut. Col. W. F. Cooke, D.S.O., Canadian Forestry Corps, and his brother, S. P. W. Cooke. They have branched out under the name of Cooke Bros. and are located at 20 St. Alexis St., Montreal. The Cooke brothers hail originally from Ottawa and are sons of Dr. S. P. Cooke of that city.

Lieut.-Col. W. F. Cooke, for many years before and after Prince George, B. C., was blessed with a railway, had a sawmill in that town and was active in the development of the interior of British Columbia. He will be remembered by many old-timers in the district as well as by numerous comrades in the army.

S. P. W. Cooke was with the E. B. Eddy Co. of Hull, Que., on the Ottawa River for a number of years and later with the H. H. Hettler Lumber Co. of Chicago and Midland. Then he took a position with the East Kootenay Lumber Co. of Jaffray, B. C., and for the past eight years has been selling agent on the prairies with headquarters at Moose Jaw, for several leading shippers of B. C. He is favorably known to the trade as "Doc" Cooke of Cooke & Cox, Moose Jaw. Cooke Bros. have a good connection in both the East and West portions of the Dominion and a host of well wishes for their prosperity.

Death of World's Oldest Lumberman

Colon Lafortune at the Advanced Age of 102 Years—Last of a Family of Centenarians

The late Colon Lafortune, Port Dover, Ont.

Colon Lafortune, the oldest lumberman in Canada, and possibly the oldest in the world, died recently at his home at Port Dover, Ont., in his 102nd year. On April 23rd last he passed his 101st milestone and was enjoying excellent health until three days previous to his death when he had the misfortune to trip over a rug in the house of his daughter, Mrs. E. L. Nicolls, and fracture a rib by falling against a table.

In the "Canada Lumberman" from time to time references have been made to the wonderful career of Mr. Lafortune, who, considering his advanced age, was as lively as many men not much more than half his years. He was particularly fond of gardening and poultry raising, and was on his feet a great deal of the

time. He had been a total abstainer all his life and did not use tobacco in any form. During the summer he performed many light tasks which were his chief delight.

Mr. Lafortune came of a long-life family, the majority of whom lived to be over 100 years of age and, any who passed away before attaining the century mark, were spoke of as "ending their days very young." Mr. Lafortune was born in 1818, one mile north of Montreal, and was engaged in the lumbering business for many years. When he first came to Port Dover on his way to the district of Port Rowan, where he lived for a long time, there was but one building in Port Dover. Mr. Lafortune followed timber cutting and log-driving for over 65 years and in his day helped to clear many forests, felling very large pine trees. He was an expert with the axe and the saw.

Mr. Lafortune went to Norfolk county in 1836 with four brothers and a sister. Another brother remained at the old home down near Montreal. His sister died at 98, a brother, Fred., at 103, and the other three all went into the middle nineties, except one, of whom Colon was wont to observe: "He died young, had only 92 years."

During his first winter Mr. Lafortune, then eighteen years of age, felled 400 giant pines four feet or over, to fill a Government order for masts. He assisted in getting them to Big Creek by oxen, where they were floated down to the bay, and during the following summer taken to Montreal in a raft. It took months to make the trip. The stalwart lumberman and river driver shot the Lachine Rapids six times on that trip. It is said that once was enough for the most daring of modern years.

When the Lafortunes reached Port Dover over the trail from Hamilton their sleep at the old tavern was broken by the howling of the wolves in the adjacent woods.

He married the daughter of John Lake of Houghton, became a Methodist, and throughout his long life attended the church of his choice regularly.

All of his surviving children reside in Norfolk county, and he has fifteen grandchildren and more than thirty great-grandchildren. The children are Frank Lafortune and Mrs. Ira Whitehead of Simcoe. Mrs. E. L. Nicolls and Mrs. Sarah Osler of Port Dover, and Mrs. Fred Overbaugh of Port Rowan.

Colon Lafortune spent the active part of his life along Big Creek lumbering and rafting. By common consent he was a foremost woodsman. If he had any specialties they were felling spar timber and driving logs down Big Creek. He worked over thousands of acres. He saw docks built in the natural harbors on Norfolk's shore front, and he saw shipbuilding develop till there was quite a fleet of boats plying a coast trade. He witnessed the virgin forest disappear, and with it the shipbuilding, and subsequently the docks. But he followed with pride the development of Canadian manufacturers that drew upon the forest for raw material.

Sudden Demise of Eastern Lumberman

F. W. Sumner of Moncton, N. B., died recently in the Royal Hotel in St. John. The end came very suddenly as a result of an attack of acute indigestion. Early in life he was associated with his father in the hardware and general store business in Moncton and

also engaged extensively in the shipping of railroad ties, pulpwood and hemlock bark to the United States. At that time it was not an uncommon sight to see half a dozen or more vessels loading at the port. Mr. Sumner built and owned a number of vessels which were engaged in this trade.

He also for a number of years carried on, in connection with his Moncton business, extensive lumbering and milling operations at Bathurst, but sold his property there some years ago to the Bathurst Lumber Co. Since that time he devoted his attention to his rapidly growing business in Moncton and to the affairs of the various industrial enterprises with which he became connected.

While Agent General for New Brunswick in London he served without salary. In this capacity he made frequent trips to England, at much personal sacrifice and during the war he rendered splendid service in looking after the interests of New Brunswick soldiers overseas.

At one time he was president of the board of directors of the St. John and Quebec Railway company. He was for a time a member of the provincial legislature and in 1908, unsuccessfully contested Westmoreland in the Conservative interests for the federal house, running against the late Hon. H. R. Emmerson. He was mayor of Moncton for six terms, and always took a deep interest in the welfare of that city.

Veteran Lumberman Expires After Long Illness

John O. Donogh, a well-known lumberman, passed away recently at his home, 53 Chestnut Park, Toronto. He has been ailing for many months from a complication of diseases, and for many years had been a sufferer from asthma.

Mr. Donogh was born in Guelph in March, 1853, and when he was quite young came to Toronto to locate. He took a position as bookkeeper in the lumber business of S. R. Briggs & Co., where ex-Mayor Joseph Oliver was then a salesman. They decided to go into business together and the firm of Donogh, McCool and Oliver was formed. In 1880 Mr. McCool withdrew and the style was changed to Donogh & Oliver. This partnership continued until 1896, when the Donogh & Oliver Co. was formed. The headquarters of the organization were removed to Tonawanda, and after a couple of years Mr. Oliver disposed of his interests to Louis H. Swan, and, returning to Toronto, organized the Oliver Lumber Co. The Swan-Donogh Co. operated in Tonawanda until 1901, when Mr. Donogh returned to Toronto and formed the Imperial Lumber Co. This was succeeded by the John Donogh Lumber Co., the Donogh Lumber Co. and the Dargan Lumber Co., at the head of which Mr. Donogh was at the time of his death. He leaves a wife and one sister, while Joseph Oliver of the Oliver Lumber Co. and Rev. Benjamin Greatrix of Peterboro are brothers-in-law.

The late Mr. Donogh was prominently identified with the Masonic Order, the I.O.O.F., the Board of Trade and other organizations, and was a leading member of Sherbourne St. Methodist Church. In his passing there is lost to the industry a firm friend, a thorough gentleman and one who by his cheerful disposition and good-nature endeared himself to all his associates. A brother, William Donogh, who was in the lumber business for a long period, passed away last Spring.

New Secretary Has Extended Experience

F. J. Niven, who was recently appointed Secretary of the Department of Lands, Forests & Mines for Ontario and also Secretary to the Hon. Beniah Bowman, has been in the department for nearly twenty-three years, during which time he was in charge of the issuance of timber licenses throughout the Province and also had the collection of ground rents, bonuses and charges on account of fire protection. The figures relating to the annual report of the department are in course of preparation and will soon be available.

Fernie Sawmill and Limits Sold

John Spence, who conducts a lumber yard in Bradford, Ont., and also does a general contracting business, reports that he has been particularly busy during the past season and has erected a number of cottages at various points along Lake Simcoe. He is a thoroughly practical man and for nearly thirty years was foreman of the Mickle-Dyment planing mill, which operated until a few years ago in Bradford and did an extensive business in that part of the country. The planing mill was taken over later by another concern and run for some time but the venture was not a successful one, and when the stock of lumber, doors, sash, window-frames, etc., was sold Mr. Spence bought the material and has been busy ever since. It is understood that the planing mill, which is a two-storey frame structure, may be put in operation again at an early date, as several parties have been looking over the plant with a view to taking hold of it.

Busy Sawmill Closes its First Year

The Manufacturers Lumber Co., Ltd., of Stratford, are one of the busiest and most progressive wholesale concerns in Western Ontario. The company operate and own a sawmill located in the village of Shakespeare, about seven miles from Stratford and the summer cut of mixed timber was recently finished, being about 600,000 ft., consisting of basswood, maple, cherry, pine and hemlock. The plant has now shut down for the winter but will start sawing again early next spring. The mill is a two-storey one with 100 horse power engine and boiler running a circular saw, edger, butting-saw, slab-saw, etc., and the capacity is about 15,000 ft. a day.

The company find a ready market for a large part of their cut

The sawmill of Manufacturers Lumber Company at Shakespeare, Ont.

in Stratford and haul the product on an eight-ton truck, which they had built for this purpose. The road from the mill to the Classic City is in first-class condition and transportation is not at all difficult.

The company had quite a stand of cedar on their site, from which they cut last winter about 1,000 telephone poles of 25 to 60 ft. in length, 20,000 cedar posts, 20,000 vineyard stakes and 6,000 ties. The accompanying view gives a good illustration of the mill and the facilities for handling lumber.

J. A. McFadgen, head of the company, is well known to the industry in Western Ontario and the sawmill plant at Shakespeare is one of the best-managed of any of the smaller industries in that part of the country. It was started about a year ago by the Manufacturers Lumber Co. Limited, which concern was organized in 1903 and is composed of J. A. McFadgen and his two brothers, G. A. and C. A. McFadgen. The firm carry on a purely wholesale lumber business handling almost entirely native hardwoods. The bulk of their trade is with Western Ontario manufacturers, although a good healthy export business is done with American customers. The Manufacturers Lumber Co. specialize in birch, basswood, maple and elm.

Mr. Johnston Buys Cedar Limit

W. H. Johnston, lumber merchant and manufacturer of Pefferlaw, Ont., accompanied by his son, returned recently from a successful deer-hunting expedition in Nipissing district. They were members of the Round Lake Hunting Club, who succeeded in getting several deer. Mr. Johnston has been remembering a number of his friends with samples of the best brand of venison steak.

During the recent wind storm which swept Ontario, several buildings in North York were unroofed, including a horse-barn belonging to Mr. Johnston. Considerable standing timber was also uprooted. A fine cedar swamp of about 50 acres in the Pefferlaw district was so badly shattered by the gale that the owner decided to place the timber upon the market and it was recently purchased by Mr. Johnston, who expects to cut the material during the winter, and will have several cars of fine stuff for delivery in the spring.

Lumber Shippers Faced with Big Loss

The exchange situation between Canada and Britain is seriously affecting the Canadian lumber trade. A credit of \$50,000,000 for purchase of Canadian lumber was arranged, but now the question has arisen regarding payment, whether in British or Canadian currency. In all, \$28,000,000 has been expended. Part of this was expended in contracts with fixed exchange, but on the remainder, with

the drop in exchange, Canadian shippers are faced from this source with \$500,000 loss. The subject is engaging the attention of the Government and it is possible further credits will be refused until there is a guarantee to Canadian shippers against loss from exchange on contracts yet incomplete and those to be arranged.

The only immediate practical remedy to right the British-Canadian exchange situation, according to Lloyd Harris, is for Canada to buy more goods in Great Britain. While an advocate of closer Imperial trade relations, he could not see where an increase in the British preference would produce an immediate result in bettering the exchange situation. An Imperial currency, with fixed exchange rights within the Empire would have a beneficial effect on Canada's export trade.

Enterprising Firm Starting Retail Lumber Yards

Carl Sorensen & Co. of Fort William, Ont., are taking out cedar posts and poles as well as cutting some logs and wood on lands owned by them in the township of Crozier near Fort Frances. They intend to put in a small mill on the land in the spring and ship the products to Port Arthur and Fort William to the retail trade in those cities. Mr. Sorensen states they will have yards in both Fort William and Port Arthur if conditions warrant the undertaking.

Mr. Sorensen has been identified with the lumber business in Minnesota and the Northwestern part of Ontario for the last twenty years and during that time has been connected with no other organization except the Shevlin interests in Minneapolis and Fort William. Carl Sorensen & Co. are an enterprising firm and the way they are going at logging operations and the lumbering business looks as if they are determined to make good in their new ventures.

Optimistic Outlook in Lumber Arena

The annual reports of the superintendents of the Bank of Montreal are optimistic as to lumber conditions. These officers of the bank are generally pretty well informed as to the conditions in the provinces, and their reports may be taken as indicative of the state of the lumber trade in Canada. Thus the superintendent of the Province of Quebec states that practically all stocks have been sold and shipped out. Prices ruled high. Labor conditions show improvement and a larger cut is looked for this winter. The demand for pulpwood from the United States was uneven, but stocks were well disposed of and high prices are expected to be maintained.

From Ontario, the report is to the effect that the production of lumber was seriously reduced owing to shortage of labor; 1919 was an excellent marketing year, with heavy sales to Great Britain and the United States, and a steady domestic demand for all classes of lumber. Prices were unusually high, there is no accumulation of stocks on hand, and notwithstanding the scarcity of labor and increased costs of operating, the year was a successful one. Pulp and paper were in large and increasing demand, with soaring prices for the latter.

In the Maritime Provinces the cut was above that of last year and was largely sold to the British and French Governments at high prices. The demand was good from the United States, but sales were curtailed owing to transportation difficulties. Labor is more plentiful, and notwithstanding high wages and the excessive cost of provisions, indications point to an average cut this coming winter.

Saw mills in the Prairie Provinces were in active operation during the year, their products finding a ready and profitable market. In the opening months of the year the B. C. lumber trade was dull, but in the spring a heavy demand arose in the United States and accumulated stocks were disposed of at rising prices. Great activity prevailed during the summer and autumn. The demand for cedar shingles was good, and prices reached unprecedentedly high figures. The outlook for the coming year is exceptionally good, both in domestic and foreign markets. The pulp and paper mills were busy, and their product is on the increase. Shipments were largely to the Orient and to the Antipodes.

Would Eliminate Oriental Labor in Mills

An effort is to be made to replace Oriental labor in the saw mills with white men, states Mr. J. C. Child, S. C. R. representative at the government labor bureaus. Mr. Child says this has been done with some success with the mill at Eburne, and in some of the Vancouver mills. Millmen are quite willing to employ white men if a sufficient number is available. The necessary preliminary therefore is to enroll a number of men. Anyone interested is asked to register either with the labor bureau or with one of the S. C. R. representatives. Naturally, the S. C. R. officials are concerned mainly with returned soldiers, but others will be welcomed, as the difficulty is to get a sufficient number of men at one time.

Personal Paragraphs of Interest

R. O. Sweezy, Forestry Engineer, of Montreal, is on a business trip to the Pacific Coast.

Allen S. Nicholson of Vancouver, Western manager of Terry & Gordon, Toronto, is spending a few weeks in the East on business and pleasure and is visiting his old home in Burlington, Ont.

C. Blakeley, the Montreal representative of Cox, Long & Co. Ltd., and Robt. Cox and Co., will, after January 1st next, represent Cox, Long & Co. only. The office will be removed from 113 to 433 Coristine Building, Montreal.

Dr. Judson F. Clark, of Clark & Lyford, Ltd., Forest Engineers, Vancouver, has gone to California for the winter months on account of his health. He still retains his interest in the firm and expects to return to Vancouver during the summer months.

R. R. Bradley, consulting forester and timber cruiser, has formed a partnership with L. R. Avery, and the firm will be known as Bradley & Avery. Their headquarters are 4 Hospital St., Montreal. The new firm will undertake field studies of all kinds, supervision of logging operations, advice on management of woodlands and also make valuation surveys and do timber cruising and forest mapping.

Martin McKee died recently at his home, 450 Jones Ave., Toronto. For a number of years he was engaged in general storekeeping, but later established a planing mill and lumber yard on his premises in Riverdale, Toronto, which he carried on for twenty-five years. Mr. McKee who was born in Belfast, Ireland, came to Canada in 1853 and was highly respected by a wide circle of his friends.

James A. Conners of the James W. Sewall office, Old Town, Maine, timber cruisers and foresters, has returned from northern New Hampshire and Vermont, where he has been cruising large areas of timberlands. Mr. Conners reports considerable optimistic feeling as to the future forest values throughout that part of the country. W. P. Billings of the same office, is engaged in estimating on some 70,000 acres of land in northern Maine.

Major James Brechin, of Victoria, B. C., who for several months past has been British Lumber Commissioner in the East, with offices in the Kent building, Toronto, left recently for the west and it is understood that it is not his intention to return to the East. During his stay in Toronto he made warm friends on all sides in the lumber industry. His duties in Toronto and the East have been assumed by William Robertson of Victoria, who spent several weeks in Toronto during the months of September and October, assisting Major Brechin in the work. Mr. Robertson has been in the forest branch of the Department of Lands as a Commissioner for some time and comes well qualified to fill his new post.

W. Gerard Power of St. Pacome, Que., President of the Canadian Lumbermen's Association, spent a few days recently in Toronto in company with Mrs. Power and called upon many members of the trade. He states that the twelfth annual convention of the Association, which will be held on February 4th and 5th in Quebec City, promises to be the most successful and important of any ever in the history of that body. Logging operations east of Quebec are proceeding satisfactorily and a great deal more timber has been felled than at this time last year. Help is still scarce in some sections and logging jobbers are paying some men as high as a hundred dollars a month and more with board. Mr. Power will operate his mill at Powerville this winter cutting spruce and expects to produce between two and three million feet during the season.

New Brunswick Lumbermen See Premier

The annual meeting of the New Brunswick Lumbermen's Association will be held on Tuesday, March 9th, in Fredericton, when officers and executive for the coming year will be elected. The Association was organized two years ago, and has done excellent work.

W. B. Snowball of Chatham, N. B., is the President, Donald Fraser, of Edmundston, N. B., vice-president, and R. W. McLellan, Fredericton, N. B., secretary-treasurer. The executive committee is composed of: W. B. Snowball, F. C. Beateay, Donald Fraser, J. W. Brankley, Daniel Richards, W. Garfield White, J. B. Gregory, James Robinson and George King.

The association has been engaged for some time perfecting its organization and keeping in touch with the Government. In New Brunswick the Crown owns the greater portion of the holdings of the large lumbermen, which are either licensed or leased to them by the Crown. The executive has been considering questions of great importance along this line, and a few weeks ago held a meeting in St. John and adopted resolutions covering important matters to be submitted to the New Brunswick legislators. Recently these resolutions were submitted to the N. B. authorities, who discussed them in detail. No definite decision was reached, but Premier Fos-

ter promised every consideration. The object of the resolutions is clearly set forth in the following, which was submitted:

Resolved:—

That this association, in a fair desire to assist the Government all it possibly can in stabilizing the lumber industry of the Province, respectfully urges the rates of stumpage be made operative for a period of ten years, as is the practice of the other neighboring Provinces, thereby enabling manufacturers to make suitable plans ahead for the good of all concerned, otherwise the very serious labor troubles and the enormous advance in wages will inevitably curtail production, wages and revenue to the Government.

Whereas:—

The Government of this Province has noted on page 2395 of the Consolidated Statutes of New Brunswick, 1903, instructed the Consolidation Commissioners not to reprint or include Chapter 96 of the Revised Statutes (1854) relating to the survey and exportation of lumber in such consolidation, as it was the Government's expressed intention at first opportunity to supersede said Act by legislation; and whereas no such legislation has been enacted:

Therefore resolved that in the absence of any recognized and mutual just and equitable scale of this Province, the regular legal Quebec scale be adopted as being eminently fair to all concerned.

Further resolved that the money raised for the prevention of forest fires by a tax levy on license holders be administered, under Government supervision, by the license holders, themselves, they being the most deeply and directly interested in fire protection.

Enters Protest About Timber Limit

H. H. Dewart, K.C., M.P.P., the Liberal leader in the Ontario Legislature, has sent a letter to the Hon. Beniah Bowman, Minister of Lands and Forests, regarding timber cutting rights on the area east of Gull River. Mr. Dewart states that too short a time was allowed for tendering, and that the sale of the limits was not advertised. The letter goes on to state that tenders would be received up to December 5th for the right to cut pine and other timber on an area east of Gull River, adjacent to the western boundary of the Nipigon forest reserves. It is declared that the area involves 128 square miles and that the circular letter which was sent out and signed by the Deputy Minister, was dated November 19th, and that all tenders were to be in by December 5th. Mr. Dewart states that the time for receiving bids is "suspiciously short," and in this connection says: The mere sending out of circular letters by a Deputy Minister to Crown Lands Agents is not a method of advertising that can be approved. I am advised that timber contractors did not receive the circular. The Black Sturgeon and Pic River sales are sufficiently fresh in the minds of the people of Port Arthur, and there will be a strong protest against any repetition of that performance.

Fernie Sawmill and Limits Sold

Particulars are to hand regarding the big lumber deal recently made by which O'Neill and Irvine, of Spokane, Wash., have acquired the mill and timber limits of the Fernie Lumber Company.

The Fernie concern, which went into liquidation six years ago, and which has been controlled by the Imperial Bank of Canada, had holdings comprising 9,000 acres of timber containing 230,000,000 ft. merchantable saw timber, cruised as chiefly high grade mountain spruce, but with considerable quantities of Douglas and white fir, cedar, tamarack and lodge pole pine. There are also, estimated, 4,000,000 mine props, 40,000 cedar poles, 700,000 cedar fence posts and all readily accessible for shipping.

The old mill will be rebuilt three miles further up Hartley creek and the standard gauge logging railway will be abandoned and its place taken by a flume nearly five miles in length which will itself cost over \$30,000. In their great Washington venture O'Neill & Irvine logged what was considered inaccessible limits by means of a flume 30 miles long and made a gigantic financial success of it. During the winter the flume will be built and by spring their second mill will be ready for logs, with a 10-hour daily capacity of 75,000 feet. Next year's cut is expected to be 15,000,000 feet. The same interests operate mills and camps at Salmo.

W. S. Burley, of the B. C. Fir and Cedar Lumber Company, Ltd., states that the company intend to reconstruct their plant, which was practically wiped out by fire several weeks ago. The new plant will have a nine-hour capacity of 75,000 feet and will be equipped with the most modern type of machinery.

How Logging Methods Have Improved

The Laurentide Co., Ltd., Grand Mere, P.Q., have provided facilities for their employees to get an insight into the technical and practical aspects of paper making. The course includes logging, this portion being in the hands of Messrs. Small & Hamilton. Mr. Small dealt with the bush work. He described the actual organization of the gangs—jobbers' gangs and those of the company—incidentally shedding considerable light on the very much improved conditions in logging camps now existing when compared with former times. The enormous supply organization necessary was gone into. Mr. Small described the way in which hundreds of men and horses were broken up into small parties for the actual work of getting out the wood to the logging roads, and so on to the lakes and rivers, to wait for the spring drive. Some details of the drive were also given.

Mr. Small's talk was particularly interesting on account of the comparatively trivial but entertaining details, showing how the element of human nature entered so much into the work and the handling of the gangs. He completed his talk with a few points on the difficulties of the drive, leaving the work at the sorting point to Mr. Hamilton.

Mr. Hamilton sketched the conditions out of which the need for a drive association had arisen, and the moral of his talk seemed to be that since the companies had gone thus far in co-operation they should take another step and abolish sorting altogether.

Mr. George Charters gave an interesting and instructive description of the "wood to mill" departments and the groundwood mill. The wood to mill departments include the slashers, the tumbling barrels, the conveyor and log pile, and the chipper room. A description was given of each essential machine with some of the more important figures connected with it. Mr. Charters had diagrams of the more unfamiliar of the machines described that helped considerably in illustrating his talk.

The Aviation Branch of St. Maurice Forest Protective Association has completed its work for the season, and the two planes loaned by the Government will be thoroughly overhauled and put into condition for further experimental work next season. Four hundred pictures covering 4,000 by 3,200 feet, were taken at an altitude of 5,000 feet. The pictures show all kinds of country, settled districts, villages, swamps, burns, cut-over districts and all sorts of timber types. Those so far developed and printed exceed expectations, and give great promise of an advance in timber mapping.

Important Decision on Logging Rights

An important case interesting to lumbermen, logging companies and sawmill owners in relation to their rights on navigable waters was decided recently in the Court of Review by Justices Demers, Panneton and de Lorimier, Montreal. The Miner Lumber Company, Limited, in initiating the litigation, claimed \$8,740 from the Whyte Campbell Lumber Company, being \$6,240 for loss of lumber and \$2,500 damages resulting, it was alleged, through defendant having opened a boom on Riviere Ouareau to a wider degree than legally allowed.

The court of first instance condemned the defendant company to pay \$5,162, but the Court of Review lately held there was error in the original judgment which found defendants at fault. The court, therefore, modified the judgment to the extent of making it virtually a reversal. Defendants were condemned to return to plaintiffs seven and a half cords of wood it was proved had reached defendants' possession, or in default pay the company \$90, the value of the wood. In any event they had to pay costs of an action for an amount of \$90, and plaintiffs were condemned to pay the costs of review.

Both companies concerned in the action have each a sawmill on river, the one belonging to plaintiffs being about a mile higher up the stream than defendants' mill. In the springtime defendants, in order to sort the mixed logs belonging to both parties, constructed a boom at McGuire's Flat, about two miles higher up the river than plaintiffs' mill, and as the logs arrived they notified plaintiffs in order

that they might send men to take part in the sorting. Plaintiffs refused and defendants thereupon put the wood of plaintiffs into the boom and allowed their own to pass down the river. There was some dispute regarding the quantities belonging to the two parties and finally an arrangement was mutually agreed upon. Then plaintiffs, finding that the sorting made at McGuire's Flat was not advantageous, sent their men to open the boom, and the logs became mixed again. The sorting continued by both parties at a boom belonging to plaintiffs just above their mill. Afterwards defendants complained that the sorting of logs and pulp wood was going on too slowly and finally their workmen opened the boom by two feet—from six to eight feet. As a result, plaintiffs alleged, they suffered loss and damage.

Free Passage of Navigable Waters

Mr. Justice Panneton, in pronouncing the judgment of the court, referred to the absolute rights of free passage on navigable waters, with modifications allowed by law for the construction of dams and booms. There was no provision regarding the width of the opening of the booms to allow the passing of the logs, but His Lordship pointed out that because the statute permitted such constructions to facilitate the lumber trade, it did not follow that the party who exercised that right could do so to the detriment of those who had the right to pass their timber down the river. The proprietor of a boom was obliged to give passage to the logs of others, and unless it could be considered that defendants had abused their right by the manner in which that right had been exercised, they could not be held responsible for any damages that plaintiffs had suffered. They had not broken the boom of the plaintiffs, as had been alleged; they had not damaged it, but had simply opened it two feet wider; and it had been done without the least deterioration. They had a right to facilities for the floating of their timber equal to those which the natural flow of the river gave them in order to obtain sufficient timber to keep their mill operating.

As the law did not give plaintiffs right to limit their boom opening to six feet, the court examined their case to see if there had been a tacit understanding between the parties, thus to limit the extent of the opening. The answer was in the negative and the conclusion arrived at was that defendants had done no more than exercise their rights.

Judgment of the court of first instance was accordingly revised in the manner reported above.

Mr. Justice de Lorimier concurred in the finding of Mr. Justice Panneton on the question of law, but was of the opinion that more wood had been lost by plaintiffs than the seven and a half cords which admittedly had been received by defendants. But plaintiffs had failed to establish the responsibility which they charged against defendants, and all that the latter could be held liable for was the quantity now valued at \$90.

Recruiting Men for Lumber Camps

The various employment bureaus of Montreal, public and private, are busy these days recruiting men for the lumber camps. While in some quarters it is reported that there is considerable unemployment, the bureaus report that they have openings for more men than are offering themselves, at least for the north woods.

Just now the between season rush is going on. The recent closing of navigation lets loose a large number of men who have spent the summer on the water front, and there is also a large number of farmers' sons who are freed from their summer avocations and anxious to earn money in the winter months by working in the lumber camps.

At the provincial employment bureau Joseph Ainey, the director, stated that there were five or six representatives of lumber companies on the spot recruiting men, and these were finding a shortage. In this rough work there is at present opening for a large number of men.

Rates and Samples on Request.

MacLEAN DAILY REPORTS, Ltd.
345 Adelaide Street West, TORONTO

The following limits are offered for sale. Cruiser's Reports and blueprints where available will be sent to Principals or their accredited Agents:—

British Columbia, Prince
Rupert District:—

160 acres freehold within ¼ mile of Skeena City on the Grand Trunk Pacific Ry. Estimated stand 5,000,000 bd. ft. within a few miles of Prince Rupert.

British Columbia R. R. Belt:—

Estimated stand approximately 300 million bd. ft. Capacity of mill 60,000 bd. ft. per day. The plant is on the main line of the C. P. R. and logs can be driven into the millpond at a minimum cost.

Quebec, Bonaventure County:

A Crownland limit of 4 sq. miles, estimated at 20,000 cords of Spruce and Fir is offered for sale. This limit is on Metapedia waters with a driving distance into the Metapedia, just above the Metapedia boom, of about 25 miles. The limit is about 14 miles from a station on the Intercolonial Ry. and the settlement extends back to within 3 or 4 miles of the northern boundary. Logs can be landed on a drivable stream for \$10.00 per M. bd. ft. and can be driven into the Metapedia boom for about \$2.00 per M. There should be a minimum profit in operating this tract of \$40,000.

Ontario, McMahon Township:

36 sq. miles of Crownland, stand estimated at 50,000,000 bd. ft. with 140,000 cords additional. Extensive tracts of timberlands for sale in all parts of Canada and Newfoundland. List your properties with us for quick results.

ADVANCES ON APPROVED CONSIGNMENTS

Seventeen Years' Experience

Review of Current Trade Conditions

Ontario and the East

December is naturally a quiet month in the lumber arena and consequently there is not a great deal of business going on particularly during the holiday period. Prices in all lines remain firm with a tendency to increase and building activity keeps up in all the leading cities, being practically double in most points to what it was last year.

The chief topic of conversation wherever lumbermen do congregate is what will be the cut this year in the woods as compared with last winter, how high will prices go next spring, how great will be the demand and will the shortage that is predicted on all sides, be as much accentuated as some are led to believe at the present time. In the meantime, the scarcity of stock is becoming more pronounced all the while. 1 x 4, 5, 6 white pine is almost an unknown quantity and there is an exceptionally brisk demand for 1 in. white pine strips, which have been commanding a high figure at the mill. Hemlock is in brisk requisition and selling at high prices. The scarcity of hardwoods in all lines continues and there is no material change in the situation from that outlined in the last edition of the "Canada Lumberman."

The stocks of many retailers are very low, shingles are advancing and are delayed in delivery owing to the car congestion and the coal shortage, and lath as one wholesaler humorously put it "will soon be as extinct as the dodo." So far as prices on lath are concerned, these are practically open. One leading member of the trade when asked by another what he could get for No. 1 and No. 2 white pine lath, remarked, "Just whatever you have the nerve to ask."

The recent windstorm throughout Ontario created a great deal of havoc and unroofed many buildings of all kinds. The outcome has been an unexpected rush for shingles and other roofing materials, and some lumber merchants have been practically cleaned out of shingles. There has also been a great deal of repair work going on throughout the country and retail lumbermen in most centres were never busier than at the present time.

B. C. stock of all kinds is scarce, particularly rough clears, and only odds and ends are coming through. There have been so many advances in prices that it is hard to keep tab on the situation and it is predicted that values will go much higher by spring owing to the abnormal demand across the border for Coast and mountain stock of all kinds.

There is practically no lumber export business with Great Britain at the present time owing to the close of navigation at Canadian ports and then again matters are in a very uncertain state owing to the sharp decline in exchange and the excellent demand that has been prevailing at home. Some exporters have lost heavily through the low exchange rates existing between England and America.

Many large contracts were accepted last winter when Canada granted a fifty million dollar credit to the British Timber Control. Then the exchange rate was bolstered and stood at \$4.86, and it was not expected that it would ever drop as low as it has. The rate dropped and Canadian dealers had to accept payment in pounds, shillings and pence, as the Britons had reserved the right to pay in either coinage.

Canadian exporters had to bring their prices down to compete with Scandinavian exporters, so that the margin of profit allowed them did not also allow for losses on exchange.

One local firm calculates that they are breaking about even by selling to United States and securing the premium on American exchange rates. An official of this company said that Canadian steamship companies cannot provide them with shipping space, so that they have to ship from American ports and on the basis of exchange rates obtaining there. The freight rates on land and sea are so high now that trans-Atlantic commerce is made more difficult than ever.

A leading manufacturer of hardwood flooring states that there is at the present time a great scarcity of rough lumber for flooring work, and that transportation difficulties are not at all favorable. Sales are now limited only by the capacity of machines and ability to secure suitable stock in order to meet the demand.

It is an ill wind that does not blow someone good and the recent hurricane throughout Ontario, which levelled trees, careened buildings and unroofed barns and sheds, has had the result of creating a lively business for retail lumbermen. There has never been such a demand for shingles as during the past fortnight, and the fact

that many dealers had just received a car or two proved to be a happy stroke of business. The result of the unusual demand is that some retailers are now practically without stock.

Deliveries of shingles are slow and the price is getting stiffer and many yardmen made the mistake of not buying when they touched low-water mark a few weeks ago. Many expected that the price would fall to \$6.00 but in this their hopes were not realized and before the figure got near that mark, it started to climb again. Wholesalers or manufacturers, who have any stocks on hand, will not sell lath without selling lumber and then will give the producers only part of a carload, filling up the rest of the space with other material.

Building activity continues very lively in all the leading centres and the increasing prices do not have any deterrent effect upon demand. More houses than ever will be erected next year, judging by present indications, and how far hemlock and white pine will soar is a matter of conjecture.

The total value of buildings erected in Toronto during the past season will likely reach \$17,000,000, which will be just double the amounts spent in structural undertakings in 1918. The aggregate of the permits has of late been running nearly a million and a half a month.

United States

Business all over the United States has naturally been more or less affected by the prolonged coal strike, the general tie-up in transportation and also the cessation of activity in many manufacturing industries. The outlook of Mexico is none too reassuring. These and other factors are tending to disturb business, and there is naturally a feeling of uneasiness until a more settled state of affairs prevails. However, building is going on actively in most centres and a record expenditure in structural undertakings is looked for next season. There is very little hardwood stock unsold, and while more or less lumber is moving in the trade, it is mostly on old orders. There is a constant advancing of prices. Much of the advance during the year has been forced by the ever increasing cost of doing business; but a considerable part of it, and more particularly recent advances, have resulted from the bidding of buyers and the law of supply and demand. Fear is expressed in some quarters that the high prices will turn the attention of factory consumers to a search for substitutes which will react injuriously to the trade of the future.

Wholesale buyers are moving with considerable caution. They are afraid to contract for the delivery of lumber far into next year at current prices, for if the market recedes it would mean a considerable loss. The manufacture of northern hardwoods will soon commence, and mill men hope to get in a large supply of logs. The success of their efforts in this direction will depend largely on the labor supply and its efficiency, but the outlook for either is not of the best.

Heavy rains in the southern hardwood districts hold out the prospect of a repetition of this year's experience, when the mills were not able to operate until well along into the busy season of the year in trade.

Speaking of the outlook generally, a leading exchange says: In the three principal producing sections, the south, the north and the west, mills stocks are badly broken. In some places stocks have been practically cleaned out. If there is stock in pile, it is sold and oversold, and still the buyers persist. Failing to get the desirable items they are taking anything they can find, and are trying to contract ahead for stock that will be cut months hence.

Much comment is heard relative to high prices, and there is much expression of opinion that they are higher than is warranted; but the highest prices are being paid by those who are bidding the market up. So keen is the need for some items of lumber and so great the competition that the wholesalers and the factory consumers are, in a large measure, responsible for the flights of the market.

To the statement that high prices will soon have their effect in slowing up business comes the answer that industrial consumers are willing to pay the top of the market for supplies to be delivered in the future, and that they, in turn, are oversold on their products.

In spite of an earnest desire on the part of manufacturers to provide ahead for a large output next year, it looks as though the scarcity of labor and the attitude of available labor would prevent the completion of any such program.

The buying of Southern pine has been very active, and on lines on which have been keen competition, there have been steady ad-

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. BOLE, Pres. F. H. GOFF, Vice-Pres. E. C. BARRE, Gen. Mgr. W. A. SAURWEIN, Ass't. Mgr.

vances. In fact buying is just about upon a level with the heavy buying spurt which normally comes in the early spring or late winter, and is largely due to the desire of foresighted lumbermen to cover their requirements while the "covering is good." Manufacturers restrict sales wherever possible and it is by no means easy to place any great volume of business for future delivery. Labor, weather and shipping conditions remain about the same, though in some localities the car supply is somewhat worse.

England

With the approach of the Christmas holidays there is not a great deal of activity in the lumber market and conditions will slow down until after the Yuletide period. Just what next year will bring forth, no one is prepared to state, but it is believed that conditions generally will become more settled and the industrial outlook more reassuring.

With labor difficulties out of the way and shopping on a normal basis, there is no reason why matters should not progress favorably in every direction. One of the big events of the past few days has been the opening of the timber exchange in London, and speaking of this auspicious event, a trade paper says: Too much stress cannot be laid upon the advantages accruing to the trade by its association with the Exchange, and the general feeling, expressed with enthusiasm, was that an excellent start had been made. Despite the very full publicity given to the trade as to place and time of meeting, it is curious that many of the members were, and are yet, in doubt of the day and hour set apart for the assembly. We desire to impress upon all concerned that the Exchange will be held on Wednesday of each week, between 2 p.m. and 4 p.m., in the Cannon-street Hotel, and, to avoid the possibility of forgetfulness, we shall refer to the fact in each issue of our paper until such time as there can be no misunderstanding. It is our pleasant duty to tender the Chairman and directors an expression of congratulation on the signal success of last Wednesday's meeting. The practical results accruing are not to be measured by the volume of work done at the moment. The seed of success, which was sown months ago, germinated in the formation of the Exchange, and its formal opening the fruition of faith in its future.

There has been little or no improvement in the state of affairs

at the Port of London as regards timber. The quays are piled with goods, and fresh boats arrive with larger quantities than are being piled away. Consequently the congestion has become worse instead of better.

Several points of great interest have arisen with regard to the liability of the receivers when quay berths are not available for their steamers, and when the boats are nevertheless admitted into the docks. It appears to be recognized—in fact, we understand there has been a legal decision on the point—that the receivers are bound to provide barges for the discharge, and that if they do not provide them the shipper may do so at the expense of the merchants. It is, in fact, the duty of the receiver to see that the ship is discharged as rapidly as possible, and if circumstances do not permit of her discharge in the most convenient manner, then other arrangements must be made. If neither the shipper nor the receiver can secure barges, then the ship must wait at her own expense.

Firmness prevails in the mahogany market and the substantial upward movement of prices which has been a feature of the past few weeks shows no signs of abatement. All descriptions are in very strong request, and particularly so in the case of African wood, stocks of which are becoming very scarce, while, on the other hand, the inquiry is showing signs of considerable expansion, not only from railway and shipbuilding quarters in the United Kingdom, but also from Continental and U.S.A. sources.

The amount of business done in the timber trade in the Manchester district is well maintained, and the general outlook points to some good trading for a considerable time to come. The great difficulty of transport is causing much annoyance and worry, and orders are not being executed as promptly as desired. The Government scheme of motor haulage has not yet been started in Manchester, although Liverpool has some 80/100 motor lorries now at work at the docks. The shortage of railway wagons is no doubt the cause of the congested state of the quays.

Prices all round are firm, and holders of stocks are not anxious sellers unless at present values. With regard to new f.o.b. or c.i.f. business, there is very little moving, although it is stated that large contracts have been made with Swedish and Finnish shippers at advanced prices by a speculative syndicate.

Deals Bring Record Prices on St. John Market

A much better tone prevails in the Eastern Spruce market and, coming, as it does, out of a darkened sky, leads one to believe that the wholesale and retail yards have not been buying through the year as much as they should have, only taking enough to cover the building which they knew was absolutely taking place, or which was in such definite shape in the hands of architects as to be equally safe for bidding.

The market all the season has been spasmodic and led the manufacturers to believe that if any extensive building operations were to take place, a very heavy demand would be made upon the mills to turn out material. The stocks of lumber at St. John, which are unsold to-day are very limited, and buyers, who are in the market are finding difficulty to locate what they need. This condition will become more acute as the mills are about finished sawing for the season, and will not resume operations until opening of navigation next spring. The only mills still running at St. John are Stetson, Cutler & Co., and practically all their stocks are sold to the British Government on old contracts.

In fact, there is not over two million feet of unsold merchantable stock at St. John to-day. This has not been a good fall for logging as it has been extremely wet during the last month and the usual amount of logs has not been put up. No snow has come to allow hauling, therefore the portable mills have not gotten into full swing, and very little new stock has yet been produced. In this immediate section men are asking excessive wages and are not producing up to normal, with supplies high; certainly logs will not be produced within \$1.50 to \$2.00 per M of last year's prices. Manufacturing will probably be in the same ratio of advance. Prices will assuredly have to be higher than during 1919 to produce any profits for manufacturers. Of course in some localities very little driving has to be done, and the deliveries to the mills are normal. In cases such as

these a much cheaper log can be had, which the fortunate manufacturer can sell either lower than his fellows or reap a rich reward on the higher log levels.

Bank log cuts along the St. John will be heavier than for some years past as the farmers have large quantities of fir or balsam, which has been killed by the "bud worm," and unless cut this winter will be a dead loss; therefore, to save the fir, they are cutting extensively. This log, of course, will be very inferior in quality and will turn out a very poor grade of stock and large quantities of refuse. Of this log the manufacturer will be very careful and will not invest his money to any great extent unless he has no other resort. Normal cuts of logs are under contract for all St. John mills, but as a rule a certain amount are hung up each year on the drive and very few mills get a full season's cut.

Locally business is good and the factories are all as busy as possible, some running extra time to try to catch up with the contracts on hand, but as much other work is in need, it does not look as if it is possible to gain much headway. Next year will, no doubt, see the factories more pushed on orders than ever before.

Prices for export remain very firm. English deals have sold this week at the highest price ever realized at St. John. This cleans up about all the deals at this port which were unsold. Steamers are arriving and more deals are moving off the wharves than for some time, and by spring practically all stocks will be removed.

Prices in the American market have improved, $\frac{3}{4}$, $\frac{2}{3}$, $\frac{2}{4}$ sized are selling at \$41.00 on cars St. John, while $\frac{2}{6}$, $\frac{4}{4}$, $\frac{4}{6}$, 2-7 at \$41.00 and $\frac{2}{8}$ at \$42.00, $\frac{2}{9}$, $\frac{2}{10}$ at \$44.00, all on cars St. John, payment in American funds, which increases the price at least \$1.75 per M under present exchange rates.

Laths \$7.50 to \$8.00 on cars. Not a lath in St. John unsold. Shingles remain very scarce and as high as last quotations. Extras and clears are all sold out.

Ottawa Stocks Decline and Prices Keep Soaring

Unusual stability, as to firmness in price, the keeping up of demand, and the continued decline in practically all stocks, together with another sharp advance in price, for the best grades of pine, and a big jump in the price of lath, provided some of the features of the Ottawa lumber market, for the first two weeks of December.

The outlook on all sides, excepting European export, and the recalling of a greater number of American cars on Canadian rails to the United States, due to the soft coal miners' strike, indicated that the market had a "bed rock" bottom. Business all around was better, prices higher, and the prospect of future trade brighter, than it was a year ago. All indications pointed to the maintenance of present prices till spring, if, in the meantime, they do not go still higher.

It was the best market for its season since the pre-war years, and showed several signs of growing stronger. One of the principal reasons was a report from the real estate market which indicated that a building boom is practically already assured for Ottawa next spring. Hundreds of thousands of dollars worth of works will be undertaken or brought to the stage of completion. Unrestricted export to foreign countries will likely open up in earnest, with a possibility of ocean rates dropping. Stocks are already low and will be lower by spring. There are already some symptoms that the programme of the lumbermen to materially increase their log output this winter, is already keeping up with the expected schedule.

In a nutshell the feeling in the trade was that lumber was going to be lumber, just the same as "pigs are pigs." The question is where are the stocks going to come from, to meet a highly inflated demand next spring? That this demand is coming at Ottawa is pretty well assured by the real estate market, which is stronger than for any year since the war commenced. For the month of November property transfers showed a substantial advance, there being 142 as compared with 98 in November 1918.

The good pine grades with lath, lead in the advance in prices, and established a new high price record. One and a half and one and a quarter to eight inch and up and 2 in. by 7 in. sidings went from \$110 to \$120 per M. No. 2 cuts, 2 x 8 advanced to \$80. One inch by seven in. made the greatest leap of all climbing from \$85 to \$105 per thousand feet. Little of the latter stock was obtainable.

One and a quarter and 1½ in. good pine strips travelled from \$75 to \$99. Two inch strips went to \$90, and pine good shorts and sidings imitated the product of aviation companies and climbed from \$56 to \$65. Lath reached the highest quotations it ever had on the Ottawa market. The No. 1 white pine grade went from \$8 to \$15. There was little or none of it available even at this figure. Lath in all grades was practically out of the market.

Rail transportation tightened up somewhat. Some shippers believed the foreign car situation would grow more acute, due to an apparent desire on the part of the American roads to get their cars back on their rails in the event of the strike of the soft coal miners continuing indefinitely.

Conditions with wood working factories remained good both as to labor and orders. All the factories were busy and reported they had enough business on their books to carry them into 1920. Owing to the increased cost of labor, and material, export prices on sash and door advanced about ten per cent. over previous lists. High class factory labor was somewhat scarce.

The woods operations of the lumbering companies while said on the whole as being generally satisfactory, were according to some reports not going ahead as fast as had been previously expected. A shortage of skilled woods labor was given as the chief cause, and "transients" was another. Weather conditions for camp operations were reported as having been good up to the first week of December. Little or no sickness among the men in the woods camps was reported.

The announcement from London that the pound sterling had dropped to \$3.87½ caused considerable speculation in circles of the trade that export to European countries. Exporters agreed that the difference in the exchange rate if it continued would work hardship to them, pointing out if they had to bring out money to pay their ocean freight rates, and prices remained the same, that it would wipe out any margin of profit. Exporters looked for the demand next spring to come for stocks for rebuilding the devastated European countries outside of England.

In connection with the woods operations as regarding the activities of I.W.W. or One Big Union Workers, Ottawa lumbermen are firmly determined that the exponents of such doctrines in their camps will get a short shrift and be told to speedily find other quarters. "We have not been troubled much yet with Bolsheviks. We are, however, on the watch for them, and if we find persons entering our camps who are aiming to spread 'red' propaganda and create

unrest, the question of their going or our staying is not going to be very long debated," remarked a well-known woods official of a leading lumbering company.

Market Conditions Generally Good in Montreal

Except for purely local business, Montreal market conditions are very satisfactory. Local trade is interfered with to some extent by the yards taking stock, but taking into consideration this and the season of the year, even this branch may be considered fairly good. The outlook for next year is generally considered to be excellent. There is promise of extensive building and of the Housing Commission getting to work on something like a practical basis. The local Trades and Labor Council have requested that the Housing Act be amended so that the conditions be made more easy for working people to build, and that the financial arrangements in particular be made less burdensome. The building permits for last month totalled \$890,864, an increase of \$714,819, while for the eleven months the total was \$9,375,500, a gain of \$4,491,824.

The sash and door manufacturers and allied branches are doing a very large business, much of the work being for out of town buildings. Recently there was an inquiry for several hundred sashes and doors for export.

The hardwood market continues very good, with a strong demand on U. S. account.

The B. C. market has undergone another change. Prices have again taken a further jump, the third since November 1. The greatest advance is in clears, although dimensions and boards are away up. The market is a very uncertain one, and wholesalers will not take orders without first ascertaining the prices asked by the mills. The demand is exceptionally good, especially for clears. Would-be buyers who hesitated found that prices have gone against them, and that delay inclosing generally meant stiffer quotations if the goods were to be secured. Owing to a shortage of cars, the amount of stock available is small. A number of circumstances, such as the coal situation, has diverted cars to various purposes other than the transportation of lumber, with the result that only a small quantity can be shipped to the East.

There has been a revival in orders for lumber for the United States. For a time there was a lull in the inquiries, but once more U. S. firms have come into the market.

Indications point to a shortage of men for woods operations. The lumber companies have applied to the Provincial Employment Agency for hundreds more men than are at present available, although over 1,100 men have been sent to camps in Quebec and Ontario. Representatives of five or six lumber companies are now in Montreal recruiting men. Wages have gone up from \$55 to \$60 per month to \$60 and \$65. Jobbers are willing to pay \$90 per month. Reports from the province are to the effect that so far the weather is favorable for logging.

Nothing can be done in the way of exports to the U. K. for some months, but it is anticipated that when the season opens there will be a reduction in freight rates, which were very high, and which exercised a restraining influence on shipments by ordinary export firms during the past season. It was almost impossible to send lumber at the prevailing rates and compete with the lumber placed on the market by the Government.

The exports of pulpwood again declined in September. The total was \$884,575, a decrease of \$333,060. For the six months of the fiscal year the value was \$5,089,693, a falling off of \$4,238,208. Paper in September was exported more freely, while chemical pulp increased \$647,479, and mechanical pulp \$173,837. During the six months chemical pulp exports were smaller by \$1,894,801, while mechanical pulp increased by \$106,272. Paper was nearly five million and a quarter dollars to the good for the six months.

Larger Exports of Lumber to Britain

During the 1919 season Canada largely increased her exports of lumber to the United Kingdom. The following are the official returns of the quantities and values of the total lumber imports into the United Kingdom for the nine months ending September, 1918 and 1919, together with Canada's share of that trade:—

	Quantity Loads	Value £	Quantity Loads	Value £
Wood and timber, hewn—				
Total imports	33,632	795,127	167,133	3,705,266
Canada	4,862	62,180	11,190	202,922
Wood and timber, sawn or split, fir—				
Total imports	996,283	13,334,147	2,749,421	30,257,627

EDGINGS

Ontario

The Bishopric Wall Board Co., Ltd., Ottawa, Ont., are erecting a factory at a cost of \$35,000.

The Bancroft Lumber & Mfg. Company, of which E. S. Hubbell, of Bancroft is manager, will erect sawmills at Paudash Lake, Ont., at a cost of \$50,000.

It is reported in Fort William that the Canadian Car & Foundry Company has decided to embark there in the building of ships as one of its chief industries.

Trussler Bros., Limited, of Trout Creek, Ont., have sold out their interest in the lumber business at that point to the Dominion Wood and Lumber Company, Limited.

The O. & W. R. Smith lumber yard, Drayton Avenue, East Toronto, has been taken over by Sheppard & Gill, who propose to enlarge the plant and carry out extensive alterations. The site covers nearly one acre of ground.

The Canadian Co-operative Mfg. Co., Smith's Falls, Ont., are building an up-to-date heading mill to manufacture headings for cheese boxes, stock barrels, etc. The equipment is all in readiness and it will not be long before this plant is in operation.

A charter has been granted to the Canadian-American Resources, Limited, Toronto, with a capital of fifty million dollars. Wide powers are conferred on the new organization, and among them are to carry on the business of lumbermen, timbermen, sawmillers, etc.

Fire recently destroyed the sawmill at Hague's Point, Lakefield, owned and operated by John Charlton. Mr. Charlton had been in Bridgenorth for some time, cutting timber from his timber lot there. The mill was insured for \$1,000 and was built about four years ago.

In the recent severe wind-storm, which visited Toronto, considerable damage was done to several lumber companies. The Simpson Planing Mills suffered a loss of some \$500, and the Gall Lumber Co., also located at the foot of Spadina Ave., had much damage done to their premises and stock of lumber.

A charter has been granted to Murray Crawford, Limited, with a capital stock of \$60,000 and head office in Campbellville, Halton County. The new concern will take over the lumber business conducted by Murray Crawford, and among the incorporators of the organization are Murray Crawford, Lloyd Crawford, Hart Crawford, James K. Mahon and Ed. D. Mahon, all of Campbellville.

Porritts & Spencer (Canada) Limited, with a capital stock of \$1,000,000, and headquarters in Hamilton, have been incorporated. The company is empowered to acquire, buy and purchase from John K. Spencer, of Albany, N.Y., a parcel of land situate in Hamilton, and to manufacture and deal in felts and fabrics of all kinds and pulp, paper, and other fibrous substances from the raw material to the finished product.

The Nyando Pulp & Paper Company of Rochester, have commenced pulpwood operations at Windigo, near Port Arthur. Camps have been established and the wood that is taken out during the winter will be shipped across the line in the spring. The Nyando Company a couple of years ago purchased practically all the timber holdings of Hogan Bros., Fort William, on Lac de Mill Lac, said to be one of the finest tracts of spruce in Ontario.

A charter has been granted to the Dominion Rubber System Housing Co. (Waterloo), Limited, with a capital stock of \$100,000 and head office in Kitchener, to acquire lands and build dwellings of moderate size and improvements to be sold at a moderate price or rented, under the provisions of the Housing Accommodation Act. Among the incorporators are John A. Martin, Norman M. Davison, Walter Hartung and others, all of Kitchener.

A charter has been granted to the Hanover Lumber Co., Limited, with headquarters at Hanover, and a capital stock of \$40,000. The company will take over the business now being conducted in Hanover by Earl F. Abell and Wm. Krauter under the partnership name of the Hanover Lumber Co. Among the incorporators of the company are Earl F. Abell, Wm. Krauter, Alex. Peppler, George Riechen and Norman W. Helwig, all of Hanover.

Complaints have been made to the Board of Control, Toronto, of the inadequacy of the police protection on the property between John Street and Spadina Avenue, where a large number of wholesale lumber yards are located. Thieves have been stealing the stock of late and the owners are demanding better guardianship of their interests. One lumberman stated that he had invested hundreds of thousands of dollars in plant and lumber at the foot of Spadina Avenue and was continually being harassed by burglars.

A series of resolutions affecting the welfare of the settler was presented to Premier Drury and his Ministers at Matheson by President Leith and A. E. Mills, of the District U.F.O. Club. They dealt with colonization and included a suggestion that portable sawmills be sent in by the Government to encourage the settler and to clear up the ground systematically. It was claimed that lumber could be delivered at the railway for twenty dollars per thousand feet. It was also urged that new road work should be planned six months ahead and that the district road inspector should have wider powers.

Eastern Canada

The J. B. A. Martin & Sons Company were recently registered in Montreal as dealers in lumber.

The Fassett Lumber Co., Limited, of Fassett, Que., whose plant has been started up again after alterations will saw hardwood until early in the spring.

George F. Chapman, a well-known lumberman, died recently at Burntland Brook, N.B. He had been ailing for a long time and was in his 57th year. For the past 40 years he had spent most of his time managing lumber camps.

It is stated that the MacLeod Pulp Company at Liverpool, N.S., has been acquired by American interests. The company has two mills on the Mersey River, two miles from Liverpool. The mills have a capacity, together, of

fifty tons a day of dry pulp. It is understood that the interests in this deal have taken over large tracts of forest lands in the southern part of Nova Scotia. The purchasers plan to enlarge and extend the operations on a very substantial scale.

Frank W. Pickels, of Annapolis Royal, N.S., has been made a director of the Labrador Pulp & Lumber Co. This company is one whose lands were surveyed by the aerial expedition in Labrador last summer. Major Owen is at the head of the organization.

The St. Lawrence Box Co., Montreal, P.Q., was recently granted a provincial charter to manufacture and deal in boxes and containers of all kinds. Capital \$20,000. M. A. Phalen, Westmount, P.Q., and C. G. Ogden, Montreal, P.Q., are two of the incorporators.

Price Bros. & Co., Ltd., Quebec, have filed a bill asking the local legislature to detach a section of Chicoutimi for the purpose of making a separate municipality under the name of Saguenay. The company are carrying out very extensive improvements in this district.

The sale of the controlling interest in the Pejepscott Paper Company and subsidiaries by the W. H. Parsons Company, of New York, to Julius H. Barnes, of Chicago, U. S. Wheat Director, was announced recently at Lewiston, Me. The property includes four mills in Maine and Nova Scotia, timber in Quebec, New Brunswick and Maine, and a fleet of tugs and barges. The sale price was estimated to be in excess of \$750,000.

The Glen Falls Pulp Company, of Glen Falls, New York, which recently bought a large area of spruce limits on the Batiscan River, on the line of the Lake St. John Railway, Que., are now taking out logs on these limits and on the River Miguick which flows into the Batiscan. The logs are to be cut into pulpwood, at the mouth of the Batiscan River, and sent by canal boat to Glen Falls, where they will be manufactured into pulp.

The Bathurst Lumber Company, Limited, of Bathurst, N.B., have purchased two large sized barking drums from the Canadian Barking Drum Company, Limited, to take care of extensive alterations they are making in their wood room. The Donnacona Paper Company, Donnacona, Que., and the New Ontario Colonization Company, Jacksonboro, Ont., have also installed extra drums which were secured from the same company.

A federal charter has been granted to the St. Maurice Power Co., Ltd., with a capital stock of \$6,500,000, and headquarters in Montreal, to carry on the business of an electric light, heat and power company, to build and construct dams, reservoirs, conduits, flumes, canals, etc. Various other wide powers are conferred upon the company, the incorporators of which are Howard Murray, Wm. S. Hart, Julien C. Smith, James Wilson and Gordon W. McDougall.

The forest belonging to the late E. Stebelin, of Weymouth, N.S., were recently cruised by a party of surveyors who have found in the property 48,000,000 superior feet of merchantable spruce and pine, 70,000 cords of pulp wood, 200,000 feet of hemlock, 3,000,000 superior feet of merchantable hardwood. The surveyors have allowed for farms, burned, etc., 1,000 acres, leaving a solid block of 8,500 acres of green timber. This land, situated on the Tusket River, constitutes the largest block of timber in the west side of lower Nova Scotia.

Western Canada

The Border Lumber Co., of Cascade, B.C., has been granted a charter. The capital stock is \$20,000.

The Smith Lumber Co. have purchased the lumber business formerly conducted by Cushing Bros., Limited, at Red Deer, Alta.

The Elliott Shingle and Lumber Co., Limited, of Vancouver, has been granted a charter. The capital stock is \$15,000.

The Otis Staples Lumber Company, at Wycliffe, will begin soon the construction of ten new houses for the workers there.

T. H. Tait, manager of the Aetna Saw Works of Vancouver, has taken out a permit for the construction of a saw factory on Industrial Island.

Recent incorporations in Alberta include the McKenna Lath & Lumber Co., Ltd., Chip Lake, Alta., and the Dome Lumber Co., Ltd., Edmonton, Alta.

J. H. Hayes & Son, of Fort Steele, B.C., have gone into the manufacture of lumber and will deal in mining timber, ties, props, etc. The company's mill is located six miles out of Steele.

The Trout Lake Shingle Mills Co., Ltd., of Trout Lake, B.C., is another new organization which has recently taken out letters patent. The capital stock is \$50,000.

Miller Saw Trimmer Company, incorporated in the State of Pennsylvania, has registered to do business in British Columbia; capital \$500,000, head offices, Pittsburg and Vancouver.

The Clark & Phillips Distributing Company were recently registered in Alberta. This company will deal in lumber and maintain offices in Vancouver, B.C. and Fort Saskatchewan, Alta. The partners are J. L. Phillips and H. W. Clark.

A serious shortage of freight cars is being reported by New Westminster lumber mills who claim they are unable to fill orders for eastern firms on account of the inability to obtain cars. At the Fraser Mills recently over one hundred carloads of lumber were awaiting shipment.

The Small-Bucklin Lumber Co., of New Westminster, B.C., is installing a horizontal band resaw, believed to be the first machine of its kind to be used in a British Columbia sawmill. It is estimated that it will add a matter of 35,000 feet to the daily capacity, bringing it up to 125,000 feet in nine hours.

Reports from various B. C. logging camps are that the supply of logs is away below normal and should an extra demand develop an acute shortage would result. The outlook for the price of lumber in the spring is that all records for British Columbia will be broken.

It is estimated that over 500,000 houses are needed in Great Britain to meet the scarcity there, according to Mr. A. E. Howard, of the War Purchasing Commission, who has just returned from a visit to several of the large British centres, including London, where he discussed with prominent capitalists and members of the government, the part the lumber industry of Canada, more particularly British Columbia, can take in solving the problem existing there. One of the immediate results will be the visit to the West of several British financial men.

Install a "By-Pass" Exhauster

in your Saw Mill, Planing Mill or Plant

Our "By-Pass" Exhaust systems save your power
and give better service. They handle green sawdust or
wet, stringy material that usually clogs up an ordinary
Blower system. The fan wheel is not overhung. No
heating, clogging, or shaking. Three bearings.

Write for information.

We manufacture and install systems complete.

Toronto Blower Company

156 Duke St., Toronto

Thousands of sawyers will tell you of their experiences with other saws before they permanently selected Disston High-Grade Cross-Cut Saws.

They will tell you of hard work with others saws that "bind" and won't "take hold."

Usually, they also speak of having tried saws that wouldn't hold their set in "hard cutting."

Then, too, they sometimes say they lost much time with saws that had to be sharpened "every time you turn around."

Now these men insist on Disston Cross-Cut Saws—they know that to use an inferior saw is to waste time and energy.

HENRY DISSTON & SONS, INC., TORONTO, CANADA

Branch: Vancouver, B. C.

All Disston Cross-Cut Saws are made of a special grade of Disston Crucible Steel—an exclusive Disston product—made only in the Disston plant.

It is the strength and edge-holding qualities of this famous saw steel, combined with right design and workmanship, that has enabled Disston to maintain acknowledged leadership in saw making for nearly eighty years.

Manufacturing All Kinds of Special Shapes in Refractories

Remember, we are making all our own blocks and making a specialty of special shapes.

We are using a high grade fire clay, which is the factor of supreme importance in all processes of manufacture. Our burners are experts. When you are in the market be sure and write us as we know you will find our proposition interesting.

Our stoker arches are designed to promote combustion and give longer life.

Our door arches and jambs are made to withstand the

strong-armed boy with the slice bar.

Our side wall blocks are made to eliminate the many joints that clinkers stick to, when ordinary fire brick is used. They give longer life and reduce air leaks to a minimum.

We designed these arches and blocks so that any handy man could replace same in half the time that it takes to repair a standard fire brick job.

Remember, Gates' blocks means cutting your cost of upkeep and fuel bills.

High Temperature Fire Clay for Emergency Repairs.

We specialize in all kinds of POWER PLANT BRICK WORK

The services of our engineers are offered to you without obligation at any time.

Send for our new catalogue describing all kinds of special shapes in fire bricks.

CANE MOLA

very heavy 100% pure Sugar
Cane Molasse

Sold in strong iron-
hooped barrels at a
very reasonable price

Write for full
Information and
Booklet

Sprinkle Cane Mola over your straw, old hay, corn stover, fodder, ensilage, screenings, etc., and reduce cost of feeding.

Cane Mola will keep your horses healthy and improve their appearance. They will winter at hard work and finish in excellent condition in the spring.

Cane Mola is ideal for keeping horses in good shape during the winter in the lumber camps.

ANALYSIS

The value of Cane Mola is principally in its sugars, salts and flavor.

It contains other ingredients of value.
Sugars (average) - - - - - 55 per cent.
(guaranteed minimum 52 per cent.)
Other Carbohydrates (average) - - - 15 per cent.
Natural Salts (average) - - - - - 5 per cent.
(not over 7 per cent.—just the right amount to act as mild laxative.)

No fibre.
Protein - - - - - 4 per cent.
Moisture - - - - - 4 per cent.

This Cover Reduces Costs on Industrial Water Hose

We never heard of industrial water hose bursting because of internal pressure. Any fairly good water hose will stand all the pressure it will ever get in industrial use.

But we have seen and heard of thousands of feet of water hose which had to be discarded long before its time because the cover wore through.

That fact guided Goodyear scientists in designing Goodyear Water Hose.

They started with a good inner tube and strong fabric.

But they put on this hose an unusually thick cover of exceptionally tough rubber.

Water Hose is dragged over floors and pavements and steel plates. It is walked on and run over by hand-trucks and wheel-

barrows. It is left outside rain or shine. The Goodyear cover on Goodyear Water Hose is built to stand this use.

That is why Goodyear Water Hose wears longer and so costs less.

That is an example of the way Goodyear builds all Industrial Hose—

—finding out what conditions must be met, and then developing the materials and construction to meet them.

Goodyear has scientifically developed a hose for every industrial use. Samples of this hose, and the advice of a trained technical man, are yours for the asking—without obligation. Phone, wire or write the nearest branch.

The Largest Veneer Lathe in the World is a Coe

This one, operated in the South, cuts large hardwood logs 200 inches long, the veneer leaving the machine of the required thickness in a wide continuous and smooth sheet.

Out in the Great Pacific Northwest, where the giant Spruce and Fir trees grow, Coe Lathes are cutting logs 7 ft. in diameter and over 10 feet long into veneers of various thicknesses.

These large improved machines are the result of our 67 years continuous experience specializing on veneer manufacturing problems throughout the world. Our organization and modern plant facilities enable us to design and build large or special size machines to meet the most exacting veneer requirements.

Put your veneer cutting problems up to us. Our experience and service are at your disposal.

Have you a copy of our new Bulletin No. 101 on the drying of veneers without defects?

STEAM OR
GASOLINE

POWER SKIDDING

STEAM OR
GASOLINE

It is really surprising the number of lumbermen who are still using horses for hauling their logs from the stump to the rail or to the water, even where the distance is such that the use of modern Skidding Machinery is not only possible, but where its use would reduce the cost of moving the logs to one-quarter or less of the present charges.

For that is what Power Skidding does—it reduces the costs, and increases the speed, and the profits.

And when the lumbermen take time to investigate and familiarize themselves with the merits of Power Skidding they will speedily adopt it, and wish they had done so sooner.

IT WILL PAY YOU TO INVESTIGATE

Our Booklet "Suggestions for the Lumberman," gives much information regarding the use of Skidding Machinery. We will send you a copy free of charge, if you wish. We will also be glad to give any information in our power by letter, to answer your questions, etc.

MARSH ENGINEERING WORKS LIMITED

Established 1846

Belleville, Ontario

Sales Agents: **MUSSENS LIMITED**, Montreal, Toronto, Winnipeg, Vancouver

These Power Skidders are made for either steam or gasoline power, and in 7 sizes, from 10 horse power up to 50 horse power.

The 10 H.P. size will handle light logs, the 50 H.P. machine will take care of the largest Canadian logs.

There are many methods of using these machines.

The High-Lead method is simple and suitable for the average camp in Ontario or East. It will skid logs any distance up to 600 feet.

The Overhead Cable system is nearly as simple to operate, and will clear a larger space, as it will skid logs up to a quarter of a mile.

The Ground Haul method is the simplest of all, but is suitable for short hauls only.

A Good Belt Saves Money

THE money wasted in keeping a stretching belt taut amounts to a surprising figure. If you use "Goodhue Belts" in your mill or factory you can save most of this money because "Goodhue Belts" stretch less by 15 to 25 per cent. than any other belt. They are made from skillfully selected hides with the stretch taken out of each section before it is made up into the belt.

According to the conditions under which the belt is to run, we recommend "Extra," "Standard" or "Acme Waterproof" belts.

Send for further particulars and prices.

GOODHUE BELTS
J.L. GOODHUE & CO. Limited.

DANVILLE — QUEBEC.

Out in Bemidji, Minnesota, at the mill of the Crookston Lumber Company, there is one of the largest gangs ever built.

Here is what the General Superintendent wrote us about our Aluminum Genuine Babbitt with which the bearings in this gang are lined.

"At this mill at Bemidji, it is the only babbitt that ever held the gang, and we have used numbers of them trying for the right one. This gang has not been babbitted in two years, and we would not have to babbitt this year, only to bring her up to level".

There is no speed too high, no shock or pressure too great for Aluminum Genuine Babbitt. Shall we send you a sample?

TORONTO HARDWOOD PRICES

The prices given below are for carloads f.o.b. Toronto, from wholesalers to retailers, and are based on a good percentage of long lengths and good widths, without any wide stock having been sorted out. War tax of seven and half per cent. on imported woods, and also the prevailing rate of exchange paid by purchaser.

Why Pay Freight On Water?

Fresh liquid milk is approximately 87 1/2% water, 3 1/2% fat, and 9% food solids — protein, milk, sugar and ash. Remove this big percentage of water, which has no greater food value than ordinary fresh water, and the fat, which costs more in milk than in meats, lard, butter and other such foods, and you have Klim—the food solids in their most economical form.

Klim is the only form in which you can obtain these milk solids free of water and with the natural flavor unchanged; it is the only form in which these solids

will keep indefinitely. Bacteria, which cause milk to sour and spoil, propagate only when water is present. When you ship Klim into camp, you pay no transportation charges on water — Klim is all food — in fact the most concentrated food you can get. It is smaller in bulk and lighter than any other form of milk and can be shipped by the cheapest way.

Klim whips readily into cold water and your men will relish the rich flavor it imparts to all dishes requiring milk.

Try a case of six ten-pound tins from your wholesale grocer.

"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9 ft. wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. BRAZEL PLOWS cut 6 in. wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road, leaving a clean roadbed. Roll and push entirely away from the road, 12 inches of loose snow each time the plow passes over.

Barks from two to three cords per hour

The Moreau Barker

Practice economy and efficiency in barking your pulpwood.

Use the MOREAU BARKER. It barks frozen logs in winter as easily as dry wood in summer. Logs from 3" to 50" in diameter handled with comparative ease with the Moreau Barker.

It has a tension spring which controls the wheels over all irregularities and according to the thickness of the bark.

Only 10 horse power is required to operate the Moreau Barker under all conditions.

Numerous letters in our possession testify to the reliability of the Moreau Barker and the satisfaction given to Canadian lumbermen.

We can prove that the Moreau Barker will do any barking demanded of it.

Write for further particulars.

The Machine That Made a Record in a Recent Lath Cutting, 10 Hour Test

Four Hundred Sawmills in the Dominion are to-day using this machine.

It has all the latest improvements and for quick, clean work has no equal.

The Payette No. 1 Bolter will cut, count, tie and pile 128,350 laths in a period of ten hours. The above consisted of 4 foot laths, 1½ by ¾ inches, and constitutes a record in rapid lath cutting.

If you are not using a Payette No. 1 Bolter you should be.

Shall we send you full particulars and prices?

FIRE BRICK

We make several brands of fire brick made by every known process of manufacture from a selection of various high grade Pennsylvania clays. This enables us to furnish the best adapted fire brick for your boilers, dutch ovens, refuse burners, kilns, etc.

We specialize in fire brick for power plants and if you will advise us whether your boilers are hand fired or stoker fired and kind of fuel used we can then give you the proper brick for your work.

We carry a large stock of our different brands in various sizes and shapes in our Hamilton warehouse, which enables us to ship at once.

We manufacture the following well-known brands:

**"Elkco Special," "Elk Steel,"
"St. Marys," "Keystone" and "Rotex"**

The Carriage You Are Looking For

Our No. 1 Size

CARRIAGE—Has three head blocks, as shown in cut, usually set 9 and 6 feet apart, will be placed any distance apart to suit purchaser. Knees open 38 in. from saw, and is fitted with Knight or Peel dogs, as desired. Taper movement on each knee. 1 15-16 in. steel set bar with steel pinions and coil spring receder, and friction lever brake for stopping knees where required. Timbers are 5 x 6 in., or heavier if desired, well bolted and braced. Diameter of truck wheel, 12 in. Axles 1 3/4 in. diameter, and extend clear across carriage, are furnished with self-oiling bearings. Front block is fitted with timber rule, placed as desired; 54 feet of V and flat track furnished with each carriage.

SET WORKS—As shown in cut, is made up of ratchet wheel 12 in. diameter, 4 in. face, with set lever carrying 7 steel pawls of varying lengths; also, same number of check pawls set in quadrant. Both sets of pawls are disengaged from either side of carriage when required to recede knees. This is a positive set, without lost motion.

FEED WORKS—As shown in cut, consists of 16 x 12 in. drum, with spur gear keyed to shaft. Pinion or friction shaft in saw frame engages with this gear. Cable takes two or three turns around drum, and is passed around end sheaves and attached to carriage. We also furnish 26 in. drum with internal gear in place of 16 in. drum when desired.

This photograph is exactly as it was taken without any attempt to make it more attractive by retouching.

A "BIG" ONE

This belt is over 8 feet in diameter, 36 inches wide by 4-ply, 1355 feet in length, and $3\frac{1}{2}$ tons in weight; or in other words, one of the longest and largest belts ever made in Canada.

It was purchased by the Montreal Harbor Commissioners for use on one of their huge grain elevators and is only one of dozens we have supplied them from time to time in the past.

Statistics show that the per-ton cost of Dunlop Belts for carrying coke, ore, coal, lime, sand, rock, cements, and many other materials, is extraordinarily low under all conditions of running.

Expert information is gladly and freely given without obligation to you.

Ask about "Gibraltar" and "Samson" Elevator and Conveyor Belts.

SAWS

(Curve Ground)

Under all conditions of test, Arrow Head Saws have proved their worth and reliability.

In the lumber camps of the Dominion they have been a big factor in increased output, better quality of work and economical production.

Are you using them?

T. F. Shurly Co., Limited

St. Catharines, Ontario

If you need a
Perfect Groover
or Gaining Head

you will be interested in a

Huther Brothers Dado Head

It will cut perfect grooves of any width either with or across the grain and will not leave the rough edges left by an ordinary groover.

It consists of two outside cutters and enough inside cutters to perform the required cut.

By simplifying intricate grooving Huther Dado Heads are bringing down the overhead costs of many plants.

Send for one on approval. Return it at our expense if unsatisfactory.

Efficient Haulage at Least Cost

BELL OIL BURNING GEARED LOCOMOTIVES

*Operated
on Liquid
Fuel*

The value of the Bell Locomotive in the speedy and economical haulage of lumber gives it a place among the equipment of every modern lumber plant. Here are some important features of the Bell Locomotive:

Cheapest fuel—Will operate on kerosene, fuel oil, distillate, or crude oils.

No hot ashes or sparks can fly out, so that fire hazard is eliminated.

Fifty per cent. greater tractive effort than direct connected type locomotive of equal weight.

One man operated—One valve fire control.

Standardized design—All parts interchangeable, and kept in stock for immediate delivery.

Why not get further particulars now?

(TRADE MARK)

High Humidity KILNS

STURTEVANT High Humidity Lumber Kilns are a distinct revelation—heralding a tremendous advance in the history of lumber drying; originally developed for—

and adopted, after rigid and exhaustive tests by—the government to dry wood used in aeroplane manufacture.

Dry Wood—*Quickly—Without Spoilage!*

Instead of months and even years as required by old, crude, inefficient kilns, Sturtevant High Humidity Kilns dry **evenly** throughout all kinds of woods in a few weeks. No casehardening, checking, splitting, or honeycombing!

The sturdy construction insures lasting and reliable operation. Compartment type design

permits easy and frequent tests, as well as individual treatments. Temperature and humidity are under easy automatic control, and circulation of air is positive.

Our large staff of kiln and engineering experts is always at your disposal.

Consult them! No obligation incurred. Request catalogue No. 254-C.

How They do it in Wisconsin

As installed in plant of
Rogers-Ruger Lumber Co.,
Superior, Wisconsin

The Yates No. 177 Double Surfacers

is used extensively by Wisconsin manufacturers in making many well-known wood products, as it is in many of the leading establishments throughout the world.

The reason for its popularity is that the No. 177 always makes good.

This machine is sturdily constructed for long service and will handle stock from capacity down to a fraction of an inch in thickness with economy and dispatch. Equipped with round heads and Yates improved grinding and jointing devices, the No. 177 will give fine finish at the fastest rates of feed.

Our free, illustrated circular gives detailed information regarding its many features. This will be sent to you on request.

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

Dunbar Engine & Foundry Co.

WOODSTOCK, N.B.

ONTARIO

Canada's Banner Province

Hewing

Ontario's timber production last year valued at \$26,774,937 or 40% of Canada's total output.

Pine production, 905,442,000 ft. B.M.

Pulpwood, 246,282 cords.

Railway Ties, 5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.

Proctor
DRYERS

For Exacting Conditions

Your individual problems of veneer drying may be different or the conditions more exacting. Because it is seldom that two drying problems are the same our engineers make a special study of your particular conditions, considering the relation of the drying to preceding and following operations, quantity to be dried, number of men employed, heat available, cost of power, etc.

Proctor Veneer Dryers give a perfectly flat and pliable product without checks or splits

Steel Carriages

**Over 450
Waterous
Carriages
Installed in
Canadian
Mills**

WATEROUS Steel Carriages are being used in the largest, best equipped Mills in Canada to-day. Built for fast cutting, for accuracy, and to give operating service, they are carefully put together of the best materials obtainable—they stay right.

Increase in cutting efficiency and the increase of cutting speed have been taken care of in the design of these carriages. Improvements in the knee and head blocks and in all moving parts to overcome lost motion; a new setworks—our No. 4—which may be attached to Steam Setter, or be replaced by trout Power set works) which absolutely prevents and will not develop slack; new style, inserted tooth; quick and easy operating dogs; a friction receder that is operated with the Setworks—these special features are what keep the Waterous Steel Carriage at its place at the head of the list of "Up-to-date Sawmill Equipment." We build our Steel Carriages in sizes of 36 in. to 72 in. knee opening, in any length and with any number of head blocks—screw or rack motion. They are adaptable for rope or gunshot feed.

Waterous
